BOTANY from the author.

NORTHERN AND MIDDLE STATES;

OR

A DESCRIPTION OF THE PLANTS FOUND IN THE UNITED STATES, NORTH OF VIRGINIA,

ARRANGED ACCORDING TO THE NATURAL SYSTEM.

WITH

A SYNOPSIS OF THE GENERA ACCORDING TO THE LINNÆAN SYSTEM—

A SKETCH OF THE RUDIMENTS OF BOTANY, AND

A GLOSSSARY OF TERMS.

LEWIS C. BECK, M. D.

PROFESSOR OF CHEMISTRY AND NATURAL HISTORY IN RUTGERS COLLEGE,

N. J.; MEMBER OF THE ROYAL PHYSICAL SOCIETY OF EDINBURGH;

OF THE LINNÆAN SOCIETY OF PARIS; OF THE NATURAL HISTORY

SOCIETY OF MONTREAL; OF THE NEW-YORK LYCEUM;

AND OF THE ALBANY INSTITUTE, &c.

ALBANY:

PRINTED BY WEBSTER AND SKINNERS,
Corner of State and North Pearl Streets.

Licenser

Med. Hist. QK 117 B3936 1833

Entered according to Act of Congress, in the District Court of the United States for the Northern District of the State of New-York, by Lewis C. Beck, of said District, in the year 1833.

TO THE

REV. LEWIS DE SCHWEINITZ, PH. D.

&c. &c.

THIS WORK

15

INSCRIBED,

AS A TRIBUTE OF RESPECT AND ESTEEM,

BY HIS OBLIGED FRIEND,

LEWIS C. BECK.

PREFACE.

THE object of this work is to furnish a description of the plants of which it treats, adapted to the present state of botanical science. In accordance with this design, I have followed the natural method of arrangement, which has already received the sanction of the best botanists of Europe, and cannot fail of being adopted by those of our own country. For the purpose of contributing in some degree to the accomplishment of this desirable result, I have given, as shortly as possible, the characters of the Natural Orders, which are arranged according to the method of Jussieu as modified by De Candolle. In this part of the work, I have consulted with great advantage the article BOTANY in the new edition of the Encyclopædia Britannica; and indeed, I have, with few exceptions, adopted the arrangement and characters of the orders there given. Of the article in question, I regret that I have as yet been unable to ascertain the name of the author, but it bears throughout the impress of one who is thoroughly versed in the subject of which it treats. I should also mention, that I have derived much assistance from Prof. Lindley's Introduction to the Natural System.

With regard to the Genera, some alterations, and as it is conceived, improvements, will be observed by the botanist. These consist, generally, in the adoption of the views of De Candolle and others, who have made the natural system a particular study. As some of the Linnæan genera are thus divided, and others remodelled, it may form a ground of objection on the part of those who have not duly considered the subject. But it should be remembered, that Botany is a progressive science; and it would be strange indeed if the labors of botanists, since the time of Linnæus, should not have resulted in a more correct knowledge of plants, and

PREFACE.

THE object of this work is to furnish a description of the plants of which it treats, adapted to the present state of botanical science. In accordance with this design. I have followed the natural method of arrangement, which has already received the sanction of the best botanists of Europe, and cannot fail of being adopted by those of our own country. For the purpose of contributing in some degree to the accomplishment of this desirable result, I have given, as shortly as possible, the characters of the Natural Orders, which are arranged according to the method of Jussieu as modified by De Candolle. In this part of the work, I have consulted with great advantage the article BOTANY in the new edition of the Encyclopædia Britannica; and indeed, I have, with few exceptions, adopted the arrangement and characters of the orders there given. Of the article in question, I regret that I have as yet been unable to ascertain the name of the author, but it bears throughout the impress of one who is thoroughly versed in the subject of which it treats. I should also mention, that I have derived much assistance from Prof. Lindley's Introduction to the Natural System.

With regard to the Genera, some alterations, and as it is conceived, improvements, will be observed by the botanist. These consist, generally, in the adoption of the views of De Candolle and others, who have made the natural system a particular study. As some of the Linnæan genera are thus divided, and others remodelled, it may form a ground of objection on the part of those who have not duly considered the subject. But it should be remembered, that Botany is a progressive science; and it would be strange indeed if the labors of botanists, since the time of Linnæus, should not have resulted in a more correct knowledge of plants, and

SKETCH OF THE RUDIMENTS OF BOTANY.

ELEMENTARY ORGANS.

- 1. The tissue of which plants consist, appears under four forms, viz: cellular tissue, woody fibre, spiral vessels, and ducts. These are called elementary organs.
- 2. Cellular Tissue or parenchyma is composed of transparent vescicles, variously cohering with each other. It is the only form universally found in plants; the other forms being often partially or entirely wanting.
- 3. Woody Fibre is a tissue consisting of elongated tubes, similar to the vescicles of cellular tissue, and is therefore often called *elongated cellular tissue*.
- 4. Spiral Vessels are formed of elastic tissue, twisted spirally into the form of a cylinder, and capable of being unrolled. They only exist in plants propagated by stamens and pistils, and hence the two primary divisions of the vegetable kingdom into Vasculares and Cellulares.
- 5. Ducts are elongated, transparent tubes, composed of tissue that is not capable of unrolling.
 - 6. All these forms are covered by a membrane called the euticle.
- 7. From peculiar combinations of the elementary organs are formed the compound organs.

ROOT.

- 8. The root is formed by the descending and dividing fibres of the stem; and by it plants are with few exceptions fixed to the earth, and nutriment absorbed.
- 9. It is distinguished from the stem by the absence of leaves, of pith even in those plants in which it is abundant in the stem, and of spiral vessels.
- 10. It usually consists of three parts; the neck, (collum) or line of separation from the stem; the body or middle portion; and the fibres or little roots, through which the nourishment is principally derived.
 - 11. The following are the principal kinds of roots:
- a. Conical, or principal tap root as it is sometimes called; tapering downwards and emitting fibres from various parts of its surface; as in the carrot.
- b. Fusiform, when the conical root is attenuated towards the neck, as well as below; as in the radish.
- c. Napiform, when it is swollen out extremely in the upper part and suddenly attenuated below; as in the turnip.
 - d. Abrupt, when the fusiform root is as it were cut off suddenly.

- a. Fibrous, a collection or bundle of fibres connected by a common head and often merely by the base of the stem; as in the grasses.
 - f. Fasciculated, when the fibres swell out slightly in the middle.
- g. Tuberous, a fibrous root bearing either at its neck or here and there attached to its fibres one or more tubers, fleshy, and containing much starchy feculent matter. These tubers are properly short subterranean stems, containing usually eyes or buds from which new plants arise.—The root should be called tuberiferous.
- h. Granulated, a collection of small tubercles with eyes fit for the reproduction of a plant, but not enveloped by cellular tissue filled with starchy matter.
- i. Bulbous, consisting of a number of scales or coats closely applied to each other, with a crown at the top and fibres below.—It performs the office of a bud, and such roots may rather be termed bulbiferous.
- 12. The direction of the root is usually towards the centre of the earth; but it is sometimes contorted or bent upwards and downwards in a zigzag manner; or erceping when it proceeds laterally at right angles from this. These have often been confounded with subterranean branches; the last of which only are troublesome to the agriculturalist.

STEM.

- 13. This is the part which springs upwards during the germination of a seed; it is the intermediate body between the root and the leaves.
- 14. When the stem of a plant arising from a seed is evident, the plant is termed *eaulescent*; and when not apparent or scarcely so, the plants have received the name of *acaules*, or *stemless*.
- 15. When the stem instead of ascending, stretches either wholly or in part, under ground, emitting here and there roots from below and branches or leaves which rise upwards, it is called a *rhizoma*; or if it do not emit fibres, a *cormus*. Most of what Linnæus incorrectly described as creeping roots are of the former description.
- 16. Stolons or runners are long stems of a peculiar nature issuing horizontally from a plant, and emitting only from the extremity roots and leafy buds, as in the strawberry.
 - 17. The stem varies in structure, in three principal modes.
- 18. In vascular plants it is either formed by successive additions to the outside of the wood, when it is called <code>Exogenous</code>; or by successive additions to its centre, when it is called <code>Endogenous</code>. In cellular plants it is formed by the union of the base of the leaves, or by a simple elongation or dilatation where no leaves or buds exist.
- 19. The stem of Exogenous plants may be distinguished into the pith, the medullary sheath, the wood, the bark, the medullary rays, and the cambium.
- 20. The pith is a mass of spongy cellular tissue occupying the centre of the stem.
- 21. The medullary sheath surrounds the pith, and consists of spiral vessels and ducts. It communicates on one side with the pith and on the other with the medullary rays, leaf buds and veins of the leaves.
- 22. The wood lies upon the medullary sheath and consists of concentric layers, one of which is formed every year. These layers are

composed of cellular tissue, woody fibre and ducts, and are traversed by the *medullary rays* composed of cellular tissue, and connecting the centre with the circumference.—The fully formed or central layers are called the *heart-wood*, and the exterior the *alburnum*.

- 23. The bark surrounds the wood, and like it consists of concentric layers, but of these the hardest or most fully formed is exterior and the youngest interior. Each concentric layer is composed of woody fibre and ducts covered externally by a layer of cellular tissue;—the woody fibre and ducts constituting the liber; and the outer cellular tissue, the epidermis.
- 24. The cambium is a viscid secretion which is formed in the spring, between the liber and alburnum.
- 25. The stem of *Endogenous* plants presents no distinction of pith, medullary rays, wood and bark, but is formed of bundles of ducts and spiral vessels interspersed through a cellular tissue; and this is surrounded by a stratum of cellular tissue and woody fibre different from bark, inasmuch as it cannot be separated from the stem itself. Such plants have their diameter increased by the addition of central vascular tissue and ducts.
- 26. Projections from the medullary sheaths sometimes reach the circumference of the stem and branches, forming what are called *nodi*, to which are attached leaves and leaf buds, and the spaces between these are called *internodia*.
- 27. Whatever is produced by the evolution of a leaf bud is a branch; A spine therefore is a kind of branch; it differs from the prickle which is a mere dilatation of the cellular portion of the bark.
- 28. The stem peculiar to the grasses and other allied tribes is termed a culm. This is simple or rarely branched, generally hollow within or fistulose, and separated at intervals by knots or partitions from which issue the leaves.
- 29. The stem may be simple or branched, and with the branches may be cylindrical, or conical; round, (terete,) or angled; smooth, furround, or rough, or hairy, &c.
 - 30. With regard to duration the stem is
- a. Annual, (\mathfrak{Q}) when it is completely developed and decays during the same scason.
- b. Biennial, (3) when it produces fruit the second season and then decays.
- e. Perennial, (14) when it produces flowers and fruit during many successive seasons.
- 31. The term *herb* or *herbaeeous* employed in opposition to *perennial*, denotes that the stem generally dies down to the ground every year.

LEAF-BUDS.

- 32. Buds are of two kinds, leaf-buds and flower-buds.
- 33. Leaf-buds consist of rudimentary leaves surrounding a vital point, the tissue of which is capable of elongation; upwards in the form of stem, and downwards in the form of wood or root.
- 34. Flower-buds consist of rudimentary leaves surrounding a point, which does not elongate after it is once developed, and assumes when fully developed, the form of reproductive apparatus.

- 35. Leaf-buds are of two kinds; the regular only found in the axils of the leaves; and the adrentitious which may be produced wherever there is an anastomosis of woody fibre.
- 36. Leaf-buds have sometimes been confounded with roots by old botanists. A bulb is a leaf-bud.

LEAVES.

- 37. Leaves are those expansions which issue laterally from the stem and branches of plants. They take their origin from the bark, and are always to be observed, whether perfect or rudimentary, immediately below the leaf-buds.
- 38. Those leaves situated near the root are often larger, and of a different shape from those higher up the stem; the former are termed radical, the latter eauline.
- 39. A leaf consists of a petiole, a lamina or limb, and a pair of stipules; but sometimes only one of these three parts can be observed.
- 40. The petiole is the channel through which the vessels of the leaf are connected with those of the stem; it is formed of one or more bundles of spiral vessels and woody fibre, enclosed in a cellular integument.
- 41. The lamina of a leaf is an expansion of the parenchyma of the petiole, and is transversed by veins which are ramifications or extensions of the bundles of vascular tissue of the petiole, or when there is no petiole, of the stem.
- 42. These veins either branch in various directions among the parenchyma, anastamosing and forming a kind of net-work, or they run parallel to each other, being connected by single transverse unbranched veins; the former structure being characteristic of Exogenous, and the latter, of Endogenous plants. To this the Conifera and Cycadea form perhaps the only exceptions; these having the stems of the Exogenous, but the same arrangement of the veins as in the Endogenese.
- 43. The principal vein of a leaf is a continuation of the petiole, running in a direct line from the base to the apex of the lamina, and is called the *midrib*.
- 44. The lamina is variously divided and formed; it is usually thin and membranous, with a distinct upper and under surface, but sometimes becomes succulent, when the surfaces cannot be distinguished.
- 45. A leaf is either simple or compound; *simple* when its lamina is undivided, or when, if separated into several divisions, these segments are not articulated with the petiole; *compound* when the lamina is articulated with the petiole.
- 46. The modes in which leaves are divided are distinguished by particular names, as pinnate, pinnatifid, bipinnate, bipinnatifid, &c. &c. These terms apply to the mode of division, and are equally applicable to simple and compound leaves.
- 47. Stipules are those small foliaceous organs sometimes situated on each side at the base of the petiole. They never occur in the Endogen®, nor in any Exogenous plants that have sheathing petioles, and are rarely found in genera with opposite leaves. They are sometimes transformed into leaves; they sometimes have leaf-buds in their axils; and sometimes also they are changed into spines.

- 48. Leaves are originally continuous with the stem, but afterwards, from a cause which is still unknown, an articulation more or less complete takes place and the *fall of the leaf* ensues.
- 49. The mode in which leaves are arranged within their bud is called *vernation* or *gemmation*. This varies much in different groups of plants.

FLOWER-BUDS.

- 50. The flower-bud consists of imbricated rudimentary or metamorphosed leaves, the external or inferior of which are usually alternate, and the internal or superior always verticillate or opposite; the latter are called floral envelopes and reproductive organs.
- 51. The leaves from the axils of which the flower-buds arise are called bracts, (bractea,) or floral leaves; and those leaves which appear on the pedicel between the bracts and calyx, are called bracteola. These, although essentially distinct, are often confounded with the former.
- 52. When a single bract is rolled together, highly developed, and coloured, and is placed at the base of the form of inflorescence called a spadix, it is named a spathe, (spatha.)
- 53. When several bracts are verticillate or densely imbricated around the base of the forms of inflorescence called the umbel, or capitulum, they are termed an *involvere*; and those at the base of each partial umbel are called *involveels*.
- 54. Small imbricated bracts are often called scales; as in the Composite.
- 55. Bracts, when placed immediately below the stamens and pistils, as in apetalous flowers, are only distinguished from the calyx by being alternate with each other, and not verticillate; hence the glumes and palex of grasses are bracts and not calyx.
- 56. The elongation of the axis of the flower bud from the point of its connexion with the stem, as far as the floral envelopes, is called the *peduncle*.
- 57. When several peduncles spring from the axis near to each other, the axis is termed a rachis, and the peduncles themselves are called pedicels.
- 58. Those axes that spring from the earth and bear no true leaves are denominated scapes.
- 59. The modes in which the flower-buds are arranged are called forms of inflorescence; and the order in which they unfold, is called the order of expansion.

INFLORESCENCE.

- 60. When a flower-bud gives rise to only one flower, terminal on its peduncle, and the axis of the plant does not elongate beyond the bud, the flower is commonly called terminal and solitary.
- 61. When the axis, however, continues to elongate and the bract retains the form and size of a leaf, the flower is called axillary and solitary.
- 62. If the buds instead of giving rise to one terminal flower have the axis elongated, bearing several flowers, and each flower on a peduncle, a raceme is formed.

- 63. When each flower is sessile or placed in the axil of the bracts, without a peduncle, a *spike* is produced: Hence the only difference between a spike and raceme is, that in the former the flowers are sessile and the latter stalked. The term spike, however, is applied in those cases where the peduncle is scarcely perceptible.
- 64. A spadix is a sort of spike, in which the flowers are closely packed together upon a succulent axis, which is enveloped in a spathc.
- 65. An ament or catkin, is a spike, the bracts or scales of which are nearly of equal size and closely imbricated, and which is articulated with the stem.
- 66. When a bud produces flower-buds, with a little elongation of its own axis, either a head, (capitulum,) or an umbel is produced. The former bears the same relation to the latter as the spike to the raceme; that is, they differ in the flower-buds of the head being sessile, and of the umbel having pedicels.
- 67. A raceme, the lowest flowers of which have long pedicels and the uppermost short ones, forming a sort of level top, is a corymb.
- 68. A panicle is a raceme, the flower-buds of which have, in elongating, developed other flower-buds.
- 69. A panicle, the middle branches of which are longer than those of the base or apex, is termed a thyrsc.
- 70. A panicle, the clongation of all the ramifications of which is arrested, so that it assumes the appearance of an umbel, is called a cymc. The cyme may have the lateral branches very short and the flowers clustered together, forming a fascicle; or it may be so contracted and the ramification of it so little apparent, as to be confounded with the true head, when it is called a glomerule.
- 71. In all the modes of simple inflorescence, that is those which proceed from the buds of a single branch, the flowers expand first at the base and last at the summit. This kind of expansion is called centripetal.
- 72. When the inflorescence is compound, or the result of the expansion of several buds or branches, the uppermost or central flowers are first developed, and lastly the outer or lower ones. This kind of expansion is called the centrifugal.

FLORAL ENVELOPES.

- 73. These immediately surround the stamens and pistils and are formed of one or more whorls of variously modified leaves. When they consist of but one whorl, they are called calyx; when of two whorls, the outer is called calyx, the inner corol, (corolla.)
- 74. If the floral envelopes are of such a nature that it is not obvious whether they consist of both calyx and corol, or calyx only, they receive the name of perianth, or perigonium.
- 75. Some plants have no floral envelopes; the flowers are then said to be naked or achlamydeous.
- 76. The calyx consists of two or more divisions, usually green, called sepals, which are either distinct, when a calyx is said to be polysepalous, or which unite by their margins in a greater or less degree, when it is called monosepalous or monophyllous, (more properly gamesepalous.)

- 77. The corol or corolla consists of two or more divisions, more or less coloured, called petals; when the petals are distinct, a corol is said to be polypetalous; when they are united by the margins, it is called monopetalous, (more properly gamopetalous.)
- 78. When all the petals are equal, the corol is said to be regular, but when they are unequal in size or cohere unequally, it is then called irregular.
- 79. The regular monopetalous corol varies greatly in its form, being campanulate or bell-shaped, infundibuliform or funnel-shaped, rotate or veheel-shaped, &c.
- 80. The calyx or corol are said to be labiate or bilabiate, when the sepals or petals are united in one or two parcels.
- 81. The papilionaecous corol consists of five petals; the upper one, usually larger than the others, is called the rexillum or standard; the two lateral ones, the alæ or wings; and the two lower ones, usually more or less united together by their lower margins, the carina or keel.
- 82. When the petal tapers conspicuously towards the base, it is said to be unguiculate or clauced; its lower part is called the unguis or clauc, its upper, the limb.
- 83. The dilated apex of the pedicel, from which the floral envelopes and stamens arise, is called the torus or receptacle.
- 84. Whatever intervenes between the bracts and the stamens belong to the floral envelopes, and is either calyx or corol; of which nature are many of the organs commonly called *nectaries*.
- 85. The manner in which the floral envelopes are arranged before they expand is called their astivation, or practoration.

DISK.

- 86. Whatever intervenes between the stamens and pistils receives the general name of disk.
- 87. The disk usually consists of an annular elevation encompassing the base of the ovary; but it sometimes appears in the form of a glandular lining of the tube of the calyx, as in the Rose; or of tooth like hypogynous processes, as in the Cruciferæ; or of a fleshy mass, as in Lamium.
- 88. The disk sometimes appears to be a mere cellular expansion or the torus, (83) as in Nelumbium.
 - 89. It is one of the parts commonly called nectary.

STAMENS.

- 90. The whorl of organs immediately within the petals is composed of bodies called *stamens*, and they are essential to the production of seed.
- 91. When stamens and pistils occur in the same flower it is termed perfect or hemaphrodite; but when the stamens are in one flower and the pistils in another, the flowers are imperfect or dictinous.
- 92. The number of stamens is variable, five or ten being the usual number among the Exogenous, and three to six among the Endogenous plants.

- 93. When the stamens do not contract any union with the sides of the calyx, they are hypogynous; as in Ranunculus.
- 94. When they contract adhesion with the side of the calyx, they become perigynous; as in Rosa.
- 95. If they are united both with the surface of the calyx and of the overy, they are epigynous; as in Umbelliferæ.
 - 96. The stamen consists of a filament and an anther.
- 97. The filument is the body which arises from the torus, and is sometimes cylindrical, or awl-shaped, or prismatical, and is even at times expanded, as if into a scale or petal; but it is not essential to the stanen.
- 98. The filaments are usually free or isolated from each other; but they are sometimes united into one tube, when they are called monadel-phous; or into two parcels, diadelphous; or into several, polyadelphous.
- 99. When they are united into a solid body along with the style, they form what is called a column, and are said to be gynandrous.
- 100. The anther is a kind of bag borne by the filament, and corresponds to the lamina of a leaf. It is sessile when there is no filament, or it is placed at the top of the filament in various ways.
- 101. The bags or cells of the anther are termed *lobes*, and the solid substance which connects them, corresponding to the midrib of a leaf, the *connectivum*. These cells are usually two in number; sometimes they are four, rarely one.
- 102. The lobes or cells of the anthers open in different ways by what is called the *line* of *dchiscence*; sometimes only a portion of this line opens, the anther is then said to *dehisce by pores*; Ex. Azalea.
- 103. The anthers frequently grow together by their margins, as in the Compositæ; when they are called syngenesious.
- 104. The anther contains and frequently emits a matter called the pollon, the use of which is to give life to the ovule or young seed.
- 105. When the grains of pollen burst, they again discharge a multitude of very minute particles, called molecules, or granules.
- 106. When the grains of pollen easily detach from each other, they are said to be *pulverulent*, and then they may be either perfectly smooth or they may be viscous.
- 107. Sometimes the grains contained in one cell or bag, instead of separating readily, cohere into what is termed a pollen mass, (pollinia.) Ex. Orchideæ.

PISTIL.

- 108. The pistil or pistillum is the organ which occupies the centre of a flower, within the stamens, and is the fruit-bearing apparatus of plants.
- 109. It is distinguished into three parts, viz: the orary, the style, and the stigma.
- 110. The ovary is a hollow case enclosing the ovules or young seeds. It contains one or more cavities called cells.
 - 111. The stigma is the upper extremity of the pistil.
- 112. The style is that part which connects the ovary and stigma; but it is often wanting, when the stigma is said to be sessile.

- 113. The pistil is either the modification of a single leaf, or of one or more whorls of modified leaves; the latter being termed carpels.
- 114. When the margins of the folded leaf out of which the carpel is formed meet and unite, a copious development of cellular tissue takes place, forming what is called the placenta.
- 115. If no union takes place among the carpels, the ovary is termed apocarpous, as in Ranunculus; but if there is an adherence, so that a compound ovary is formed, it is called syncarpous.
- 116. When carpels unite, those parts of their sides which are contiguous grow together, and form partitions between the cavities of the carpels, called dissepiments.
- 117. When these dissepiments are so contracted as not to separate the cavity into a number of distinct cells, but merely project into a cavity, the placentæ which occupy the edges of these dissepiments become what is termed parietal.
- 118. If the dissepiments are abortive or obliterated, the placentæ remaining unaltered in the axis, a free central placenta is formed.
- 119. A one-celled ovary may also be formed out of several carpels in consequence of the obliteration of the dissepiments; Ex. Nut.
- 120. If the ovary adheres to the sides of the cally it is called inferior, and the cally is said to be superior.
- 121. If it contracts no adhesion with the sides of the calyx, it is called *superior*, and the calyx *inferior*.

OVULUM.

- 122. The orule or orulum is a body borne by the placenta, and is destined to become the seed; its position is of great importance in determining natural affinities.
- 123. When the ovule is fixed by its base to the bottom of one of the cells of the ovary, of which it takes the direction, it is said to be *erect*; or if it hangs from the summit of the cell, it is *inverted*.
- 124. When it is attached to the middle portion of the placenta, it may have an upright direction, and is then called ascendant, or point downwards and is then suspended. Generally, however, the erect and ascendant ovule are confounded under one name, and the inverted and suspended are known by the term pendulous.
- 125. The ovule is either sessile, or on a stalk called the funiculus or podosperm; and in either case the point by which the union is formed is termed the base of the ovule, and the other extremity the apex.
- 126. The ovule consists of a nucleus and two external coats; the outer of which is called the testa or primine sac; and the inner, the internal membrane, or secundine sac, or the tegmen.
- 127. The base of the nucleus is always incorporated with the base of the internal membrane, and their common base is attached at some points to the testa. The junction of the three, forms the chalaza.
- 128. The mouths of the primine and secundine sacs usually contract into a small aperture called the *foramen* of the ovule, or the *exostome*. It is through this foramen that the molecules of the pollen are introduced into the nucleus; and its position indicates the future position of the radicle of the embryo, the radicle being always next the foramen.

129. When the apex of the nucleus is contiguous to the base of the ovule, a connection takes place between the base of the ovule and the base of the nucleus, by a bundle of vessels called a raphe.

FRUIT.

- 130. Fecundation having taken place, the floral envelopes usually fade away, the stamens disappear and the pistil increases in size and becomes the fruit.
- 131. Hence the fruit should have the same structure as the pistil, but this is not always the case, for as the pistil advances to maturity many alterations take places, in consequence of abortion, non-developement, obliteration or even union of parts.
- 132. The base of the fruit is the part where it is joined to the peduncle; the apex is where the remains of the style are found.
- 133. The portion of the pistil called the ovary is in the ripe fruit termed the pericarp.
- 134. The pericarp consists of three parts, the outer coating called the epicarp, the inner lining called the endocarp or putamen, and the intermediate substance named the surcocarp or mesocarp. Sometimes these three parts are readily distinguished, as in the peach; but they frequently form one uniform substance, as in the nut.
- 135. The axis of the fruit is often called *columella*; the space where two carpels unite is named the *commissure*.
- 136. If the pericarp neither splits nor opens when ripe, it is said to be indehiscent; but if it does split or open, it is said to dehisce, or to be dehiscent; and the pieces into which it divides are termed values.
- 137. When a fruit is in its simplest state, or formed by the transformation of one carpellary leaf, there may be two sutures or lines by which it may open, the one where the margins of the leaf or the placentæ meet, called the *ventral suture*, the other at the part corresponding to the midrib of the leaf, or the *dorsal suture*.
- 136. If, in a compound fruit, the line of opening corresponds with the junction of the carpels the dehiscence is *septicidal*. Formerly in this kind of dehiscence the *valves* were said to be *alternate with the disseptment*.
- 139. If the opening is by the dorsal suture of each carpel, the dehiscence is localicidal; or as it was formerly said, the dissepiments are opposite to the valves.
- 140. When a separation of the pericarp takes place across the cells horizontally, the dehiscence is *transverse*.
- 141. If the dehiscence is effected by partial openings of the pericarp, it is said to take place by *pores*.
- 142. All fruits are either *simple* or *multiple*; the former proceeding from a single flower, as the Apple, Nut, Strawberry, &c.: the latter formed out of several flowers, as the Pine-apple, Fig. &c.
- 143. Simple fruits are either indehiscent or dehiscent; of the former the most important are the caryopsis, the utricle, the achenium and the drupe.
- 144. The caryopsis, is where the pericarp is very thin and membranous, and adheres firmly to the integument of the seed; Ex. Wheat and Barley.

- 145. The utricle is similar to the caryopsis, the pericarp being membranous, but it has no adherence with the seed.
- 146. The achenium, (acine,) in which the pericarp is hard and bony, as well as distinct from the proper covering of the seed; as in the Composite.
- 147. A drupe is a fleshy nut enclosing a putamen; Ex. Cherry and Peach.
- 148. The nut contains a putamen, but the sarcocarp is coriaceous, instead of being fleshy.
 - 149. The dry dehiscent fruits are the follicle and the legume.
- 150. The follicle is a carpel dehiscing by the ventral suture, and having no dorsal suture.
- 151. The legume is a carpel having both ventral and dorsal sutures, by either of which or by both or neither it may dehisce; rarely the sides fall off, bearing nothing but sutures, which then form a kind of frame, called a replum. When articulations take place across the legume and it falls into several pieces, it is said to be lomentaceous.
- 152. Of fruit formed of several carpels the principal are the capsule, the silique, gland, berry, orange, pome, and pepo.
 - 153. The capsule is a many-celled, dry deliscent pericarp.
- 154. The silique, (or pod,) consists of two (or four) carpels fastened together, the placentæ of which are parietal and separate from the valves, remaining in the form of a replum and connected by a membraneus expansion; when the silique is very short, or broader than it is long, it is called a silicle or pouch.
- 155. The gland is a dry bony, indehiscent, one-celled and one-seeded fruit, proceeding from an ovary of several cells and seeds, and enclosed by an involucre called a cupulc. Ex. Quercus.
- 156. The berry is a succulent fruit, the seeds of which lose their adhesion when ripe, and lie loose in pulp; as the grape or gooseberry.
- 157. The orange is a berry having a pericarp, separable into an epicarp, an endocarp and a sarcocarp, and the cells filled with pulpy bags, which are cellular extensions of the sides of the cavity.
- 15S. The pome is a union of two or more inferior carpels, the pericarp being fleshy and formed of the floral envelope and ovary firmly united.
- 159. The pepo is composed of about three carpels, the sides of which do not turn far inwards, nor the margins unite. It is a one-celled, fleshy, indehiscent fruit, with parietal placents.
- 160. The most remarkable modifications of multiple fruits are the cone, pine-apple, and fig.
- 161. The cone or strobile is an indurated ament. When it is much reduced in size, and its scales cohere, it is called a galbulus; as in Thuja.
- 162. The pine-apple in a spike of inferior flowers, which all grow together in a fleshy mass.
- 163. The fig is a fleshy, hollow, dilated apex of a peduncle, within which a number of flowers are arranged, each of which contains an achenium.

SEED.

- 164. The seed is the ovule arrived at maturity.
- 165. It consists of integuments, albumen and embryo; a naked seed is only found in those rare cases in which the ovule is naked.
- 166. The seed proceeds from the placenta, to which it is attached by the funiculus; sometimes this becomes expanded about the seed into a fleshy body, called the aril.
- 167. The scar which indicates the union of the seed with the placenta, is called the *hilum* or *umbilicus*.
- 168. The integuments are called collectively *testa*, and consist of membranes resulting from the sacs of the ovule. These membranes are called by various names.
- 169. Between the integuments and the embryo of some plants lies a substance called the *albumen* or *perisperm*; the nature of this is of great importance.
- 170. The albumen is sometimes farinaccous, as in the grasses; coriaccous and almost cartilaginous, as in many Umbeliferæ; ruminated or wrinkled as in Anonaceæ; horny as in the coffee-bean; or thin and membranous, as in many Labiatæ.
- 171. The embryo is the organized body that lies within the seed, which is destined to become a plant similar in all respects to the parent. It is usually solitary in the seed, but occasionally there are two or several.
- 172. The embryo consists of the cotyledons, the radicle, the plumula and the neck.
 - 173. The cotyledons represent the undeveloped leaves.
- 174. The *plumula*, is what is destined to become the stem, and is therefore a rudimentary leaf-bud.
- 175. The radicle is the rudiment of the root, and by germination becomes the root.
- 176. The ncck or collum is the line of separation between the radicle and the portion above it.
 - 177. The number of cotyledons varies from one to several.
- 178. Plants that have but one cotyledon, or if with two, then the cotyledons alternate with each other, are Monocotyledonous. These are also Endogenous plants.
- 179. Plants that have two cotyledons placed opposite each other, or a greater number placed in a whorl, are called *Dicotyledonous*. These are also *Exogenous* plants.
- 180. Plants that have no cotyledons, are said to be Acotyledonous. But this term is only applied to cellular plants, which having no stamens and pistils, can have no seed.
- 181. When the radicle is so bent that it touches the back of one of the cotyledons, it is said to be dorsal, or the cotyledons incumbent.
- 182. When the radicle is applied to the edge or cleft of the cotyledons, it is said to be lateral, or the cotyledons accumbent.
- 183. When the seed is called into action, germination takes place and growth commences.

GLOSSARY OF BOTANICAL TERMS.

The figures refer to the preceding Sketch.

Abortion, an imperfect developement of any given organ.

Abruptly pinnate, pinnate with even pairs only, wanting the odd or terminal leafet.

Accumbent, lying on, prostrate, a term employed in Crucifcræ,

Accrose, stiff, linear, and sharp, as in the leaves of the Pines.

Acine or achenium, 146. Acotyledonous, 180.

Aculeate, prickly.

Aculeus, a prickle; growing to the bark, not to the wood.

Acuminate, taper pointed, more than acute.

Acute, ending in a sharp point. Adnate, growing to, affixed lateral-

Agglomerated, bunched, crowded together.

Aggregate, standing together, many on the same receptacle, but not compound.

Alated, sec Winged.

Albumen, 169.

Alternate, placed alternately on opposite sides of the stem.

Ament, or eatkin, 65.

Amplexicaul, see Clasping. Ancipital, two edged.

Androgynous, having barren and fertile flowers on the same spike, or the same plant, but no perfect ones.

Annual, 30 a.

Anther, 100.
Antheriferous, bearing anthers.

Apetalous, without petals, Apex, end, tip, or sharp extremity.

Aphyllous, without leaves. Appendiculate, having some appen-

Appressed, pressed against or close

Approximate, near together. Apterous, without wings. A term

applied to some parts of flowers. Arborcous, like a tree.

Arborescent, approaching to the size of a tree.

Arcuate, curved or bent like a bow. Aril, 166.

Aristate, awned, ending in a bristle. Armed, furnished with thorns or prickles.

Articulated, jointed.

Ascending, rising from the ground obliquely.

Assurgent, rising upwards.

Attenuated, gradually diminished or tapering.

Auriculate, having an ear-like base. Awn, a stiff bristle, frequently rough or bearded; as in the flowers of certain grasses.

Awned, having awns. Awnless, without awns.

Axil, the angle between a leaf and stem on the upper side.

Axillary, growing in or from the axil.

Baccate, berried, having a fleshy coat or covering.

Banner or rexillum, 81. Barren, producing no fruit, con-

taining stamens only. Beak, any thing which resembles the beak of a bird, hard short

points. Berry, 156.

Bicuspidate, with two points. Bidentate, with two teeth.

Biennial, 30 b.

Bifid, two cleft, cut nearly in two

Biglandular, having two glands. Bilabiate, having two lips.

Bilobed, having two lobes. Bilocular, having two cells. Binnate, growing two together.

Bipiunate, twice pinnate, when both the leaf and its subdivisions are pinnate.

Bipinnatifid, twice pinnatifid, both the leaf and its segments being pinnatifid.

Biternate, twice ternate, the petiole supporting three ternate leaves.

Bivalved, two valved.

Border, the brim, or spreading part of a corol.

Brachiate, branches opposite, and each pair at right angles with the preceding.

Bract, 51. Bulb, 36, 11 i.

Caducous, falling early, sooner than deciduous.

Cæspitose or eespitose, growing in

Calcarate, resembling, or furnished with, a spur.

Calli, small callosities or rough protuberances.

Calyciform, shaped like a calvx. Calyculated, furnished with an ad-

ditional outer calyx. Calyptriform, shaped like a calyp-

tra or extinguisher.

Calyx, 73.

Campanulate, bell-shaped. Canaliculate, channeled or furrow-

Canescent, whitish, hoary.

Capillary or capillaccous, very slen-

der, resembling a hair.
Capitate, shaped like a head, or bearing a head.

Capsule, 153.
Carina, 81.
Carinated, keeled, furnished with a sharp or prominent back like the keel of a vessel.

Carpel, 113. Caryopsis, 144. Catkin, see Ament.

Caudate, having a tail; as in some

Caudex, the main body of a tree or root.

Caulescent, 14.

Cauline, growing on the stem.

Cell, a cavity or compartment of a seed vessel, or anther.

Cellular, made up of little cells or cavities.

Chaffy, made of short membranous portions like chaff.

Ciliate, fringed with parallel hairs. Cirrose, or cirrhose, bearing a ten-

Clasping, surrounding the stem

partly or quite, with the base of

Clarate, club shaped, larger at top than bottom.

Claw, the taper base of a petal, 82. Cleft, split or divided less than half way.

Clypcate, shaped like a Roman buckler.

Coadunate, united at base.

Cochleate, resembling the shell of a

Coloured, different from green which is the common colour of plants.

Columella, 135.

Column, 99.

Comose, covered with cottony hair. Compound, made up of similar simple parts.

Compressed, flattened.

Cone, 161.

Conglomerate, crowded together. Confluent, running into one another. Connate, jointed together at base.

Connivent, converging, the tips inclining towards each other.

Contorted, twisted, bent from a common position.

Convolute, rolled together.

Cordate, heart shaped.

Coriaceous, leathery, tough and thick.

Corneous, horny, having a consistence like horn. Corniculate, horn shaped.

Corol or Corolla, 77.
Cortical, belonging to the bark.

Corymb, 67.

Costate, ribbed. Cotyledons, 171-2. Creeping, 12, 16.

Crenate, scolloped, having sharp notches on the edge separated by round or obtuse dentures.

Crennlate, finely or minutely cre-

Crowned, having a circle of projections round the upper part of the tube of a flower, on its inside.

Cruciform, or cruciate, consisting of four petals placed like a cross. Crustaccous, having a hard brittle

Cucullate, hooded or cowled, rolled or folded in; Ex. spathe of Arum triphyllum.

Cucurbitaceous, like gourds or mel- | Dimidiate, halved.

Culm, or straw, 28.

Cuncate, or cuneiform, wedge shap-

Cupule, 155.

Cuspidate, having a sharp straight

Cuticle, 6, 23.

Cyathiform, cup-shaped.

Cylindrical, round and not tapering, cylinder shaped.

Cyme, 70.

Cymose, bearing or flowering in cymes.

Deciduous, falling off, in opposition to persistent and evergreen, later than eadueous.

Declined, or declinate, turned down-

Decompound, twice compound, composed of compound parts.

Decumbent, leaning upon the ground, the base only erect. Decurrent, when the edges of a leaf run down the stem or stalk.

Decursive, see decurrent.

Decussated, or decussating, in pairs crossing each other.

Deflected, bent off.

Dehiscent, gaping or cracking open.

Deltoid, nearly triangular.

Dentate, toothed, edged with sharp projections separated by notches, larger than scrrate.

Denticulate, minutely toothed. Dentures, teeth, the sharp parts which separate notches.

Depauperated, few flowered.

Depressed, flattened or pressed in at

Diaphanous, transparent.

Dichotomous, forked, dividing into two equal branches.

Dicoccous, containing two grains or seeds.

Dicotyledonous, 179.

Didymous, twin.

Didynamous, belonging to the class Didynamia, with two short and two long stamens and a ringent

Diffusc, scattered, widely spread. Digitate, when a petiole gives off five or more leafets from a single point at its extremity.

Dioccious, having the barren and fertile flowers on different plants. Discoid, having a disk covered with

florets, but no ray.

Disk, 86; also the centre of a head of flowers of Compositæ.

Dissepiments, the partition or internal wall of a pericarp.

Distichous, two-rowed; producing leaves or flowers in two opposite

Divaricate, diverging so far as to

turn backward.

Divergent, spreading, separating

Dorsal, growing on, or belonging to, the back.

Drooping, inclining downward, more than nodding.

Drupaccous, bearing, or resembling,

Drupe, 147.

Echinate, beset with prickles, hedge-

Effusc, a term applied to a loose onesided paniele; Ex. Juneus effu-

Elliptic, oval.

Elongated, exceeding a common or average length.

Emarginate, having a notch in the

Ensiform, sword shaped, two edged. Entire, even and whole at the edge. Epidermis, see cuticle.

Eroded, appearing as if gnawed at

Esculent, eatable.

Evergreen, remaining fresh through the winter, not deciduous.

Exscrted, projecting or extending out of the flower or sheath.

Falcate, sickle shaped, linear and crooked.

Fascicle, 70.

Fascicled, or fasciculate, collected in bundles.

Fastigiate, flat topped.

Favosc, resembling a honey comb. Fertile, containing perfect pistils and vielding fruit.

Fibrous, being composed of fibres. Filiform, thread like, or very slendedge like fringe.

Fistulous, or fistular, hollow or tubular.

Flabelliform, spreading like a fan. Flagelliform, like a whip lash. Flexuous, serpentine or zigzag.

Floral lcaf, see bract.

Floret, a little flower, one in an aggregate or compound flower. Folliele, 150.

Frond, the leaf of cryptogamous plants.

Fruteseent, or fruticose, shrubby. Fugacious, that which lasts but for a short time.

Funicle, or funiculus, 166.

Funnel shaped, tubular at bottom and gradually expanding at top. Fusiform,

Galca, a helmet; the upper part of a ringent corol.

Geminate, doubled.

Gemmaceous, belonging to a bud, made of the scales of a bud, 49. Genieulate, bent like a knee.

Germ or germen, the old name of the Ovary.

Germination, the sprouting of a seed.

Gibbous, swelled out, commonly on one side.

Glabrous, smooth, as it regards hairiness or pubescence.

Glandular pubescence, hairs tipped with little heads or glands.

Glaucous, sea green, pale blueishgreen. Glomerate, gathered in a round heap

or head.

Glume, the scales, valves, or chaff, which make the calyx of grass-

Glutinous, adhesive, viscid, covered with an adhesive fluid.

Gramineous, resembling grasses. Granular, formed of grains, or covered with grains.

Gymnospermous, having seeds.

Gynandrous, having the stamens growing on the pistils.

Habit, the general external appearance of a plant, by which it is known at sight.

Fimbriate, finely divided at the | Hamate, hooked, a bristle curved at the end.

Mastate, shaped like a halbert; it differs from arrow shaped in having the barbs or lateral portions more distinct and divergent.

Head, 66.

Helmet, see galea. Herbaceous, or herb, 31. Hermaphrodite, 91.

Hilum, 167.

Hirsute, rough with soft hairs. Hispid, rough with stiff hairs. Hoary, covered with white down

Hooded, see cucullate.

Horn, see spur.

Hybrid, a mongrel or partaking of the nature of two species.

Hypocrateriform, salver shaped, with a tube abruptly expanded into a flat border.

Hypogynous, 93.

Imbricate, lying over each other like. scales, or the shingles of a roof. Incised, cut, separated by incisions. Included, wholly received or contained in a cavity, the opposite of exscrted.

Incrassated, thickened upward, lar-

ger toward the end. Incumbent, lying against or across,

Indehiseent, not opening.

Indusium, the involucre or veil which covers the fruit of ferns.

Inferior, lowermost.

Inflated, blown up like a bladder. Inflexed, bending inwards.

Inflorescence, 59.

Infundibuliform, funnel shaped. Inserted into, growing out of.

Internode, the space between joints; as in Grasses.

Interruptly pinnate, when smaller leafets are interposed among the principal ones.

Involucel, a partial involucre, 53. Involucre, or involucrum, 53; also the Indusium.

Involute, rolled inwards.

Irregular corol, 78.

Keel, 81.

Keeled, shaped like a keel.

Kidney-shaped, heart-shaped without the point, and broader than long.

Labiate, 80.

Laciniate, cut or divided into segments.

Lactescent, yielding a white, or milky juice, when wounded; as in the Poppy.

Lacunose, covered with little pits or depressions.

Lamellated, in thin plates.

Lamina, 41.

Lanceolate, spear shaped, narrow, with both ends acute.

Lanuginous, woolly.

Lateral, at the side.

Lax, loose, not compact.

Leafet, a partial leaf, a constituent of a compound leaf.

Legume, 151.

Leguminous, bearing legumes.

Ligneous, woody.

Ligulate, ribbon shaped, a kind of corol found in compound flowers, consisting of a tube at bottom, continued into a long flat portion at top.

Liliaceous, resembling the lily.

Limb, 82.

Linear, long and very narrow with parallel sides.

Lip, the front segment of an orchideous or other flower.

Lobe, a large division or distinct portion of a leaf or petal.

Loment, 151.

Lunate, or lunulate, shaped like a half-moon.

Lyrate, pinnatifid, with a large roundish leafet at the end.

Marcescent, withering.

Melliferous, honey bearing. Membranous, or membranaceous, very thin and delicate.

Midrib, 43.

Monadelphous, 98.

Moniliform, arranged like the beads of a necklace.

Monocotyledonous, 178.

Monoecious, having barren and fertile flowers on the same plant.

Monopetalous, 77. Monophyllous, 76. Monosepalous, 76.

Mucronate, having a small point projecting from an obtuse end.

Multifid, many cleft.

Multipartite, many parted.

Muricate, covered with sharp spines or prickles.

Nectariferous, bearing honey.

Nectary, 84, 89.

Nerves, parallel veins, 42.

Nodding, inclining to one side, partly drooping.

Nodi or nodes, 26.

Nodose, having many nodi or joints.

Nucamentaceous, producing nuts.

Ob, a particle, which when prefixed to any other term, denotes the inversion of the usual position; as obovate, obcordate, &c., i. e. inversely ovate, inversely cordate, &c.

Obconic, conic with the apex down-

ward.

Obcordate, heart shaped with the point inward, or downward.

Oblong, longer than oval with the sides parallel.

Obovate, ovate, but inverted.

Obsolete, indistinct, appearing as if worn out.

Obtuse, blunt, rounded, not acute. Ochroleucous, whitish yellow, cream-colour.

Opposite, standing directly against each other on opposite sides of the stem.

Orbicular, circular.

Oval, elliptical.

Ovarium or ovary, 110. Ovate, egg shaped, oval with the lower end largest.

Ovoid, egg-like.

Ovule or ovulum, 122.

Palate, a large obtuse projection which closes the throat of a personate flower.

Palea, a term applied to the parts of the corol in Grasses.

Paleaceous, chaffy.

Palmate, hand shaped, deeply divided into spreading and somewhat equal segments.

Panduriform, contracted in the middle like a violin.

Panicle, 68.

Papilionaceous, 81.

Papillose, producing small glandular excrescences like nipples.

Pappus, the crown of the fruit of Compositæ and similar plants.

Parasitic, growing on another plant and drawing nourishment from it; as the Misseltoe.

Parietal, 117.

Parted, deeply divided, more than cleft.

Partial, a term applied to small or constituent parts in distinction from general.

Partition, the dividing wall or dissepiment in seed vessels.

Pectinate, like the teeth of a comb, intermediate between fimbriate and pinnatifid.

Pediccl, small footstalk of a flower,

Peduncle, the common footstalk of flowers, 56.

Pellicle, a very thin stratum or

Peltate, having the stalk attached to some part of the surface or disk, and not to the margin.

Pendulous, hanging down. Pencilled, ending like a painter's

pencil or brush. Perennial, 30 c. Perfect flower, 91.

Perfoliate, surrounding the stem on all sides and perforated by it; it differs from connate, in not consisting of two leaves; Ex. Eupatorium perfoliatum.

Perianth, perianthium or perigonium, 74.

Pericarp, 133.

Perigynous, 94. Permanent, see persistent.

Persistent, not falling off; those parts of a flower are persistent which remain till the fruit is ripe.

Personate, masked, having the mouth of the corolla closed by a prominent palate.

Petal, 77. Petaloid, like a petal.

Petiole, 40.

Phanogamous, applied to all plants which have visible flowers containing stamens and pistils.

Pilose, hairy, with a stiff pubescence.

Pinna, the leafets or divisions of a pinnate leaf.

Pinnate, a leaf is pinnate when the

leafets are arranged in two rows on the side of a common petiole.

Pinnatifid, cut in a pinnate manner; it differs from pinnate in consisting of a simple or continuous leaf, not compound.

Pisiform, formed like peas.

Pistil, 108.

Pistillate, having pistils, but no stainens.

Plane, flat.

Plicate, plaited, folded like a ruffle or fan.

Plumosc, feathery, feather like. Plumula, 174.

Pod, 154.

Polygamous, having some flowers which are perfect, and others which have stamens only, or pistils only.

Polygynous, having many styles. Polymorphous, changeable, assum-

ing a variety of forms.

Polypetalous, 77.

Polyphyllous, having many leaves. applied to the calyx.

Polysepalous, 76.

Polyspermous, having many seeds. Pome, 158.

Porrected, extended forward.

Pouch, 154.

Præmorse or abrupt, 11 d.

Prickle, 27.

Prismatic, having several parallel. flat sides.

Procumbent, lying on the ground. Proliferous, an umbel or flower is said to be proliferous when it has smaller ones growing out of it.

Pseudopinnate, falsely or imperfectly pinnate, not resolving at any time into separate leafets; as the Pea, Vetch, &c.

Pubescent, hairy or downy.

Pulp, the soft, juicy, cellular substance found in berries and similar fruits.

Pulverulent, dusty, composed of powder, or appearing as if covered with it

Punctate, appearing as if pricked full of small holes, or dots.

Punctiform, resembling dots.

Pungent, sharp, acrid, prickling. Putamen, a hard shell.

Pyriform, shaped like the fruit of a pear.

Quadrangular, four angled. Quaternate, four together. Quinate, five together.

Raceme, 62.

Racemose, flowering in racemes.
Rachis, that part of a culm which
runs up through the ear of corn,
and consequently the part that
bears the flowers or fruit in
other plants.

Radiant or radiate, often applied to a cluster or head of flowers when those of the circumference or ray are long and spreading, and un-

like those of the disk. Radical, growing immediately from

the root. Radicle, 175.

Ramose, branching.

Ray, the diverging florets or petals which form the outside of radiate flowers, cymes, and umbels.

Receptacle, 83.

Reclined, or reclinate, bending over, with the end inclining toward the ground.

Recurred, curved backwards.
Reflexed, bent backward, more than

recurved.

Reniform, kidney shaped, heart shaped without the point.

Repand, slightly wavy or serpentine at the edge.

Resupinate, turned upside down; as the corol of Trichostema.

Reticulate, net like, having veins distributed like net work.

Retuse, having a slight sinus, or superficial notch in the end, less than emarginate.

Revolute, rolled barkward or out-

Rhomboidal, having four sides with unequal angles.

Ribbed, marked with parallel ridges or veins.

Ringent, irregular, with an upper and under lip. See Labiate. Rooting, sending out lateral roots. Rostrate, furnished with a beak.

Rotate, wheel shaped, applied to a monopetalous corol, the limb of which is flat and tube very short.

Rudiment, a term applied to an organ that is imperfectly developed.

Rufescent, becoming reddish-orange or rusty.

Rugose, wrinkled, leaves of Sage. Rugulose, finely wrinkled.

Runeinate, having large teeth pointing backward; as the leaves of the Dandelion.

Saccate, bagged, having a bag or pouch; as in many petals.

Sagittate, arrow shaped, like the head of an arrow.

Salver shaped, see Hypocrateriform. 'Samara, a seed vessel not opening by valves, having a winged or membranous appendage.

Sarmentose, running on the ground and striking roots from the joints; as the strawberry.

Scabrous, rough with little asperi-

ties.

Seale, any small processes resembling minute lcaves; also the leaves of the involucre of Compositæ.

Scape, 58.

Scarious, having a thin membranous margin; the calyx scales of Liatris scariosa.

Seions, lateral shoots or offsets from the root.

Scrobiculate, excavated into little pits or hollows.

Secund, arranged on one side only, the same as unilateral.

Segment, a part or principal division of a leaf, calyx, or corolla. Semibivaloular, half divided into two-valves.

Sepals, 76.

Septa, the partitions that divide the interior of the fruit.

Septiferous, bearing septa. Scriceous, silky.

Serrate, notched like the teeth of a saw, the points tending upward. Serrulate, minutely serrate.

Sessile, placed immediately on the stem without the intervention of a stalk.

Setaccous, bristle like.

Setæ, bristles.

Setiform, formed like a bristle. Setosc, covered with bristles.

Sheath, a tubular or folded leafy portion inclosing the stem; see the leaves of Grasses.

Silicle, 154. Silique, 154.

Siliquose, having siliques.

Simple, not divided, branched, or compound.

Sinuate, having sinuses at the edge. Sinus, a large rounded indentation or cavity.

Soboliferous, producing plants from the root.

Sori, plural of sorus, small clusters of minute capsules on the back of the fronds of ferns.

Spadix, 64.

Spathe, a sheathing calyx opening lengthwise on one side, and consisting of one or more valves.

Spatulate or spathulate, obtuse or large at the end, and gradually tapering into a stalk at base. Spike, 63.

Spikelet, a small spike; as in many of the Grasses.

Spindle shaped, see Fusiform.

Spine, 27.

Spinulose, covered with spines.

Sporule, that part in cryptogamous plants which answers to the seed of other plants.

Spur, a sharp hollow projection from a flower, commonly the nectary.

Squamiform, scale shaped.

Squamose, scaly.

Squarrose or squarrous, ragged, having reflected or divergent

Staminate, having stamens, but no pistil.

Standard, see Banner.

Stellate, like a star.

Stem, 13.

Stemless, 14. Sterile, barren. Stigma. 111.

Stipe, the stem of a fern or fungus; also the stem of the down of seeds, as in Dandelion; also a particular stalk of germs, seeds, &c., which is superadded to the pedicel.

Stipitate, having a short stalk. Stipular, belonging to stipules. Stipule, 47.

Stoloniferous, having scions or runing shoots.

Striate, marked with fine parallel lines.

Strigose, bristly. Strobile, 161.

Strophiolate, surrounded by protuberances.

Style, 112.

Sub, a particle prefixed to various terms, to imply the existence of a quality in a diminutive or inferior degree, as

Subacute, somewhat acute, less than acute, &c.

Subserrate, slightly serrate, &c.

Subsessile, nearly sessile.

Subulate, awl shaped, narrow, stiff and sharp pointed.

Sueeulent, juicy.

Sueker, a shoot from the root or lower part of the stem.

Suffrutieose, somewhat shrubby, shrubby at base.

Suleate, furrowed. Suture, 137.

Tendril, a filiform appendage of certain vines, which supports them by twining round other objects.

Terete, round, cylindrical.

Terminal, extreme, situated at the

Ternate, three together; as the leaves of common Clover. Testa, 168.

Thorn, see Spine.

Throat, the passage into the tube of a corolla.

Thyrse, 69.

Tomentose, downy, covered with fine matted pubescence.

Toothed, divided so as to resemble teeth.

Torose, uneven; alternately elevated and depressed.

Torulose, slightly torose.

Torus, 83.

Trifid, three cleft.

Trifoliate, three leaved, see Ternate. Trilobate, three lobed.

Trilocular, three celled. Tripartite, three parted.

Triquetrous, having three sides or angles.

Truncate, having a square termination as if cut off.

Tuberculate, covered with knobs or tubercles.

Tuber, a solid fleshy knob, 11, g.

Tuberous, 11, g.

Tubular, shaped like a tube; in a compound flower, the florets which are not ligulate, are called tubular.

Tunicated, coated with concentric

layers; as the Onion.

Turbinate, shaped like a top or pear.

Valves, the segments or parts of a seed vessel, into which it finally separates, 136; also the leaves which make up a glume or spathe.

Valvular, or valved, consisting of

valves or seed cells.

Vaulted, arched over, with a con-

cave covering.

Veincd, having the divisions of the petiole irregularly branched on the under side of the leaf.
Ventricose, swelling, inflated.

Verrucose, warty, covered with little protuberances.

Vertical, perpendicular.

Verticillate, whorled, having leaves given off in a circle round the

Versatile, swinging lightly on a stalk so as to be continually

changing direction.

Vesicular, made of vesicles or little

Vesiculose, bladder like.

Villous, or villose, hairy, the hairs long and soft.

Virgate, long and slender, wand like.

Virose, poisonous, nauseous, and strong to the smell.

Viscid, or viscous, thick, glutinous, covered with adhesive juice.

Viviparous, producing a collateral offspring by means of bulbs.

Umbel, 66.

Umbelliferous, bearing umbels.
Umbilicate, marked with a central depression.

Unarmed, without prickles or

thorns.

Uncinate, hooked, hook shaped. Undulated, wavy, serpentine, gently rising and falling.

Unguiculate, inserted by a claw, 82. Unilateral, growing all on one side, or with the flowers leaning to one side.

Urceolate, pitcher shaped, swelling in the middle and slightly contracted at top.

Utricle, or utriculus, 145.

Wedge shaped, formed like a wedge, and commonly rounded at the largest end.

Wheel shaped, see Rotate.

Winged, having the sides extended into a leafy expansion.

Wings, the two lateral petals of a papilionaceous flower, 81.

TABLE OF LINNÆAN ARTIFICIAL CLASSES AND ORDERS.

DIV. I. Plants with conspicuous flowers. PHANEROGAMIA.

A. Stamens and Pistils in the same flower.

* Stamens free and equal.

6. HEXANDRIA, 6 stamens. Monandria, with 1 stamen. 7. HEPTANDRIA, 8. OCTANDRIA, 9. ENNEANDRIA, 7 stamens. 2. DIANDRIA, 2 stamens. 3 stamens. 8 stamens. 3. TRIANDRIA, 4. 4 stamens. 9. Enneandria, 5 stamens. 10. Decandria, 9 stamens. TETRANDRIA, 5. PENTANDRIA, 10 stamens.

*11. Dodecandria, 11 to 19 stamens.

ICOSANDRIA, 20 or more stamens, perigynous or inserted on the calyx. 12. POLYANDRIA, 20 or more stamens, hypogynous or inserted on the re-

ceptacle.

ORDERS.-In the first 13 classes the orders depend solely on the number of pistils, and they are named—Monogynia 1. Digynia 2. Trigynia 3. Tetragynia 4. Pentagynia 5. Hexagynia 6. Heptagynia 7. Octagynia 8. Enneagynia 9. Decagynia 10. Polygynia more than 10.

** Stamens free, unequal.

14. DIDYNAMIA, 4 stamens, 2 longer than the others.
Two orders. 1. Gymnospermia, the secds naked. 2. Angiospermia, the seeds inclosed in pericarp.

15. Tetradynamia, 6 stamens, 4 longer than the others.

Two orders. 1. Siliculosa, fruit a silicle or pouch. 2. Siliquosa, fruit a long pod or silique.

*** Filaments united.

16. Monadelphia, filaments forming 1 set. 17. Diadelphia, filaments forming 2 sets.

*18. POLYADELPHIA, filaments forming more than 2 sets.

Orders depend upon the number of stamens, and have the same names as the first 13 classes.

**** Anthers united.

19. Syngenesia, 5 stamens, the anthers united (compound flowers.) Five orders, 1. Polygamia Equalis, florets all perfect. 2. P. Snperflua, disk florets perfect, rays pistiliferous. 3. P. Frustranea, disk perfect, rays neutral. 4. P. Necessaria, disk with stamens, rays with a pistil. 5. P. Segre-

**** Anthers united to the pistil.

20. Gynandria.

gata, with a perianth to each floret.

Orders named according to the number of stamens, as Monandria, &c.

B. Stamens and Pistils in different flowers.

Monoecia, stamens and pistils on the same individual.
 Dioecia, stamens and pistils on different individuals.

Orders named according to the number of stamens, except where there is a union of the filaments; then named Monadelphia, &c.

*23. POLYGAMIA, perfect and unisexual flowers either on the same or different individuals.

Three orders. Monoecia. Dioecia. Trioecia.

DIV. II. Plants with inconspicuous flowers. CRYPTOGAMIA.

24. CRYPTOGAMIA, neither stamens nor pistils.

Six orders, viz. 1. Filices. 2. Musci. 3. Algo. 4. Fungi. 5. Hepatica. 6. Lichenes.

^{*} The classes marked thus, * viz. Dodecandria, Polyadelphia, and Polygamia, are generally discarded by the American botanists. They comprize, at least in our country, but few genera, and their characters are extremely variable. They are, however, retained by Muhlenberg and Bigelow, and very generally by the European authors.

SYNOPSIS OF GENERA, ACCORDING TO THE LINNÆAN SYSTEM.

Monandria.

Monogynia.

Saliconnia. Perianth single, turbinate, fleshy, closed. Stam. 1-2. Style bifid. Utricle included. Chenopodea, p. 298.

Hippuris. Cal. adnate to the ovary; limb minute entire. Cor. none. Style received into a groove of the anther. Nul 1-seeded. Halorageα, p. 123.

DIGYNIA.

Callitriche. Fl. perfect or imperfect. Bracts 2, opposite, petaloid. Cal. (corol of authors,) inconspicuous. Cor. none. Caps. compressed, 2-celled, 4-seeded. Haloragea, p. 123.

BLITUM. Perianth single, 3-cleft. Seed 1, covered by the calyx which becomes a berry. Chenopodea, p. 299.

DIANDRIA.

Monogynia.

* Flowers complete, inferior, 1-petalled, regular.

Ligustrum. Cal. minute, 4-toothed. Cor. with the tube short; the limb 4-cleft, spreading. Berry 1-celled 2-4-seeded. Oleaceæ, p. 231.

Chionanthus. Cal. 4-parted; Cor. deeply 4-parted; segments long and linear. Drupe 1-seeded. Nut striate. Oleacex, p. 232.

** Flowers complete, inferior, 1-petalled, irregular.

Vernnica. Cal. 4- rarely 5-parted. Cor. subrotate, 4-lobed, unequal. Caps. 2-celled, obcordate. Seeds few. Scrophularinea, p. 261.

Leptandra. Cal. 5-parted; segments acuminate. Cor. tubularcampanulate; border 4-lobed, a little ringent. Stam. and at length the pistil much exserted. Caps. ovate, acuminate, 2-celled, manyseeded. Scrophularinea, p. 262.

Gratiola. Cal. 5-parted, often with 2 bracts at the base. Cor. tubular, sub-bilabiate; upper lip emarginate; lower 3-lobed. Stig. 2-lobed. Caps. ovate, 2-celled, 2-valved. Scrophularinea, p. 264.

LINDERNIA. Cal. 5-parted. Cor. tubular, ringent; upper lip short, emarginate; lower one 3-cleft, unequal. Fil. 4; the two longer, forked and sterile. Caps. 2 celled, 2-valved; dissepiment parallel with the valves. Scrophularinea, p. 265.

Hemianthus. Cal. tubular, cleft on the under side; border 4-toothed. Cor. with the upper lip obsolete; lower 3-parted; intermediate segment ligulate and truncate, much longer, closely incurved. Stam. 2. Fil. bind; lateral fork antheriferous. Caps. 1-celled, 2-valved, many-seeded. Scrophularinea, p. 267.

CATALPA. Cal. 2-parted. Cor. campanulate; tube ventricose: border 4-lobed, unequal. Stam. 2, fc tile; 2—3 sterile. Stig. bilamellate. Caps. long, cylindric, 2-valved; dissepiment opposite to the valves. Sced membranaceously margined. Bignoniacea, p. 245.

JUSTICIA. Cal. 5-parted, often with 2 bracts. Cor. 2-lipped; upper

. Ep emarginate; lower 3-cleft. Auth. 1 or 2 on each filament. Caps. attenuated, 2-celled, 2-valved; dissepiment growing from the centre of each valve. Acanthacea, p. 285.

Utricularia. Cal. 2-parted, nearly equal. Cor. personate, with the lower lip spurred at the base; Fil. incurved, bearing the anthers within the apex. Stig. 2-lipped. Caps. 1-celled. Lentibularia, p. 286.

Pinguicula. Cal. 4-5-cleft. Cor. ringent, spurred at the base beneath. Stam. very short. Stig. 2-lipped. Lentibularia, p. 286.

CRYPTA. Cal. 2-leaved, inferior. Cor. 2—3, petalled, closed. Style almost wanting. Stig. obtuse. Caps. 2—3-celled, 2—3-valved; cells 4—5-seeded. Elatinea, p. 55.

Obs. The remaining genera of this division have lipped corols, and a naked seeds. They form, with the plants of Didynamia Gymnospermia, (from which indeed they only differ in having two of the stamens abortive,) the Natural Order Labiala, p. 270.

*** Flowers complete, superior.

C_{IRCÆA}. Cal. short; limb 2-parted. Pet. 2. Stig. emarginate. Caps. ovate, hispid, 2-celled, 2-valved, 2-seeded. Circæaceα, p. 120.

**** Flowers incomplete.

Lemna. Sterile and fertile fl. collateral. Utricle 1-5-seeded. Pistiacce, p. 383.

TRIANDRIA.

Monogynia.

* Flowers superior, complete.

Valerianella. Cal. with the limb toothed and persistent. Car. not calcarate, regular, 5-lobed. Fruit 3-celled, submembranaceous, indehiscent, crowned by the limb of the calyx; 1 or 2 of the cells only fertile. Valerianeæ, p. 164.

VALERIANA. Cal. with the limb involute, at length evolved in a decidous plumose pappus. Cor. with the tube obconic or cylindric, equal or gibbous at base; limb obtusely 5-cleft. Fruit indehiscent, 1-celled. 1-seeded. Valerianca, p. 164.

** Flowers superior, incomplete.

IRIS. Perianth 6-cleft; 3 of the segments larger and reflexed, the others erect. Style short or none. Stig. 3, petaloid, covering the stamens. Iridea, p. 353.

Lachnanthes. Perianth 6-parted: segments unequal. Style declining. Stig. minutely 3-lobed. Caps. 3-celled, truncated, many-seeded. Hamodoracca, p. 374.

*** Flowers inferior, complete.

Commelina. Cal. 3-leaved. Cor. 3-petalled. Stam. 6, 3—4 usually sterile and furnished with cruciform glands. Caps. 3-celled, 3-valved; one of the valves often abortive. Commeline, p. 375.

XYRIS. Fl. in an ovate cylindric head. Cal. glumaceous, cartilaginous, 3-valved. Cor. 3-petalled, equal. Stig. 3-cleft. Xyrideæ, p. 370.

**** Flowers inferior, incomplete.

Schollers. Spathe 1-flowered. Cor. tube very long; limb deeply 6-parted. Anth. of 2 forms. Caps. 1-celled. Pontederea, p. 369.

HETERANTHERA. Fl. in a spathe. Cor. tube long and slender; border 6-parted, equal. Anth. of 2 forms. Caps. 3-celled, many-seeded, opening at the angles; dissepiment contrary. Pontedereæ, p. 369.

Sistrinchium. Spathe 2-leaved. Perianth 6-cleft, flat, equal. Stam. cohering below. Stig. 3-cleft. Iridea, p. 353.

***** Flowers glumaceous.

Obs. All the genera of this division belong to the subclass Glumacee, and all except Cenchrus, Spartina and Ocyzopsis, belong to the order Cyperacee, p. 420.

DIGYNIA.

Oss. All the genera of this order are proper grasses.—Graminea, p. 386. The family is so entirely natural, that it is unnecessary to repeat the generic descriptions.

TRIGYNIA.

Mollugo. Cal. 5-parted, coloured within. Cor. none. Caps. 3-celled, 3-valved, many-seeded. Caryophyllea, p. 50.

Lechea. Cal. 3-sepalled, with 3 outer bracts. Pet. 3, lanceolate. Stig. 3, scarcely distinct. Caps. 3-valved, with as many inner valves opposite the others. Seeds few. Cistinea, p. 36.

PROSERPINACA. Cal. superior, with the tube adhering to the triquetrous ovary. Carp. 3, indehiscent, dry, concreted into a 3-sided fruit. Haloragea, p. 121.

TETRANDRIA.

Monogynia.

* Flowers superior. Corol 1-petalled. ..

CEPHALANTHUS. Common cal. none; proper minute, angular, 4-cleft. Cor. tubular, slender, 4-cleft. Style much exserted. Stig. globose. Caps. 2-celled, 2-seeded. Recept. globose, hairy. Rubiaceae, p. 160.

DIFFACUS. Common cal. many-leaved, foliaceous; proper superior, 1-leaved. Cor. tubular, 4-lobed. Seed solitary. Recept. conic, chaffy. Dipsacea, p. 164.

Gallum. Cal. with the tube ovate-globose or oblong; limb nearly wanting. Cor. rotate, 4-parted. Seeds 2, roundish, rarely oblong. Rubiacca, p. 161.

Diodia. Cal. with the tube ovate or obovate, 2—4-toothed. Cor. funnel-form, 4-lobed. Caps. ovate, 2-celled, bipartile. Rubiaceæ, p. 161.

Hervoris. Cal. 4-toothed or 4-parted. Cor. tubular, bearded at the throat, 4-parted. Caps. ovate, 2-celled, opening transversely at the top, many-seeded; dissepiment contrary to the valves. Rubiaceα, p. 160.

HOUSTONIA. Cal. 4-cleft. Cor. funnel-form, 4-cleft. Caps. 2-celled, 2-valved, many-seeded, opening transversely. Gentianae, p. 242.

MITCHELLA. Fl. by pairs upon the same germ. Cal. 4-toothed. Cor. funnel-form; tube cylindric; limb 4-parted, spreading, villous on the inner side. Stam. scarcely exserted. Stig. 4-cleft. Ber. by the union of 2 germs didymous, 4-seeded. Rubiacce, p. 160.

LINNEA. Cal. with the tube ovate; limb 5-parted; segments lanceolate-subulate. Cor. turbinate, subcampanulate, 5-lobed. Stam. somewhat didynamous. Stig. globose. Ber. small, ovate, dry, 3-celled; (one cell only with a perfect seed.) Caprifoliaceæ, p. 159.

** Flowers superior. Corol many-petalled, or none.

Cornus. Cal. 4-toothed. Pet. 4, oblong. Drupe with a 2-celled nut. Cornea, p. 153.

Isnardia. Cal. 4-parted, persistent. Cor. 4-petalled or none. Caps. 4-sided, 4-celled, many-seeded. Onagrariæ, p. 119.

Sanguisorba. Cal. 4-cleft, with 2 scales at base externally. Pet. none. Carp. 2, included within the calyx, crowned by a style with a fimbricate apex, converted into dry indehiscent 1-seeded acines. Sanguisorbae, p. 114.

. *** Flowers inferior. Corol 1-petalled.

Plantago. Cal. 4-cleft. Cor. 4-cleft; border reflected. Stam. mostly exserted, very long. Caps. 2-celled, opening transversely. Plantaginea, p. 292.

Centaurella. Cal. 4-parted, appressed. Cor. subcampanulate, 4-parted; segments somewhat erect. Stig. thick, glandular, and somewhat 2-cleft. Caps. 1-celled, 2-valved, many-seeded, surrounded by the persistent calyx and corol. Gentianeæ, p. 243.

Exacum. Cal. deeply 4-parted. Cor. 4-cleft; tube globose. Caps. bisulcate, 2-celled, many-seeded. Gentianex, p. 242.

Swertia. Cal. flat, 4—5-parted. Cor. 4 or 5-parted; tube very short; border spreading, with 2 nectariferous ciliate pores at the base of each. Style short. Stig. 2. Caps. 1-celled, 2-valved. Gentianex, p. 240.

Frasera. Cal. deeply 4-parted. Cor. 4-parted, spreading; segments oval with a bearded orbicular gland in the middle of each. Caps. compressed, partly margined, 1-celled. Seeds few, large, imbricate, with a membranaceous margin. Gentiance, p. 241.

Obolaria. Cal. 2-parted, resembling bracts. Cor. campanulate 4-cleft; segments entire, sometimes crenulate. Stam. proceeding from the cleft of the corol, somewhat didynamous. Stig. emarginate. Caps. ovate, 1-celled, 2-valved, many-seeded. Gentianex, p. 244.

**** Flowers inferior. Corol 4-5-petalled.

Ammannia. Cal. campanulate, 8-toothed. Cor. 4-petalled or none, inserted upon the calyx. Caps. 4-celled, many-seeded. Salicaria, p. 125.

PTELEA. Cal. 4—5-parted. Pet. 4—5, spreading. Stig. 2. Samaræ compressed, orbicular, 2-celled, 2-seeded, with a broad and circular margin. Zanthoxyleæ, p. 71.

***** Flowers inferior. Corol wanting.

RIVINA. Cal. 4-parted, persistent. Pet. none. Ber. 1-seeded. Seed lentiform, scabrous. (Stam. 4, 8 and 12.) Phytolaeceæ, p. 300.

Styrandra. Perianth 4-parted, spreading. Stam. divergent. Ber. 2-celled. Smilacex, p. 357.

Symplocarpus. Spathe ventricose-ovate, acuminate. Spad. subglobose, covered with perfect flowers. Cal. deeply 4-parted, persistent; segments cucullate, truncate, becoming thick and spongy. Pet. none. Style pyramidal, 4-sided. Stig. simple, minute. Seeds numerous, immersed in the spadix. Aroidea, p. 382.

Alchemilla. Cal. 8-cleft; segments spreading, alternately smaller. Cor. none. Style lateral, from the base of the germ. Fruit covered by the calyx. Sanguisorbex, p. 114.

DIGYNIA.

Hamamelis. Cal. 4-lobed, with 2-3 scales at the base. Pet. 4, long, ligulate. Caps. coriaceous, 2-celled, 2-valved at the top. Seed 1 in each cell. Hamamelidex, p. 152.

Tetragynia.

ILEX. Cal. 4—5-toothed, persistent. Cor. 4—5-parted. Stam. 4—5. Stig. 4—5, subsessile. Ber. 4—5-seeded. Illicineae, p. 230.

Sagisa. Cal. 4-5-parted. Pet. 4-5, or none. Caps. 4-5-valved, 1-celled, many-seeded. Caryophyllex, p. 49.

TILLEA. Cal. 3-4-parted. Cor. 3-4-petalled, equal. Carp. 3 or 4, two-seeded. Crassulaceæ, p. 133.

RUPPIA. Fl. on a spadix. Cal. and eor. none. Seeds, (Drupes,) 4, pedicillate. Flaviales, p. 385.

POTAMOGETON. Fl. on a spadix. Cal. 4-leaved. Cor. none. Anth. sessile. Nats 4, 1-seeded, sessile. Flaviales, p. 385.

PENTANDRIA.

Monogynia.

* Flowers 1-petalled, inferior, with 4 naked seeds or nuts.

Obs. The genera of this division constitute the Nat. Ord. Boragin-ex, p. 251.

** Flowers 1 petalled, inferior. Seeds in a capsule.

(Capsule 1-celled.)

Anagallis. Cal. 5-parted. Cor. rotate, 5-lobed. Fil. hairy. Caps. globose, bursting transversely all round. Primulacea, p. 291.

Lysimachia. Cal. 5-parted. Cor. rotate, 5-cleft. Caps. 10-valved. Primulaeex, p. 290.

PRIMULA. Cal. tubular, 5-toothed. Car. salver-form; tube cylindrical; orifice naked. Stig. globose. Caps. opening with 10 teeth. Primulaceæ, p. 288.

DODECANTHEON. Cal. 5-cleft. Cor. rotate, reflexed, 5-cleft. Stam. seated in the tube. Caps. oblong, opening at the apex. Primulacex, p. 288.

MENYANTHES. Cal. 5-parted. Cor. funnel-form; limb spread-

ing, 5-lobed, equal, hairy within. Stig. capitate. Caps. with the axis of the valves seminiferous. Gentianeæ, p. 244.

VILLARSIA. Cal. 5-parted. Cor. rotate; limb spreading, 5-lobed, ciliate on the margin. Stig. 2-lobed. Glands 5, alternating with the stamens. Caps. 2-valved, many-seeded. Gentianeæ, p. 243.

HOTTONIA. Cal. 5-parted. Cor. salver-form, 5-lobed. Stam. seated on the tube of the corol. Stig. globose. Caps. globose, acuminate. Primulacea, p. 289.

Sabbatia. Cal. 5—12-parted. Cor. rotate, 5—12-parted. Anth. at length revolute. Stig. 2, spiral. Caps. 2-valved, many-seeded. Gentianeæ, p. 241.

ERYTHRÆA. Cal. 5-cleft. Cor. funnel-form; limb short, 5-cleft, spreading. Anth. after flowering spiral. Style erect. Stig. 2, roundish. Caps. linear. Gentianeæ, p. 242.

Hydrophyllum. Cal. 5-parted. Cor. campanulate, 5-cleft, with 5 longitudinal melliferous grooves inside. Stam. exsert; filaments bearded in the middle. Stig. bifid. Caps. globose, 2-valved. Hydrophylleæ, p. 255.

Nemophila. Cal. 10-parted; alternate lobes reflexed. Cor. sub-campanulate, 5-lobed; the lobes emarginate, with margined nectariferous cavities at base. Stam. shorter than the corol; fil. naked. Style 2-cleft. Caps. fleshy, 2-valved, 4-seeded. Hydrophylleæ, p. 255.

(Capsules 2-3-celled.)

Phacella. Cal. 5-parted. Cor. subcampanulate, 5-cleft, with 5 longitudinal margined grooves within. Stam. exsert. Style filiform. Stig. 2. Caps. 2-celled, 2-valved, 4-seeded. Hydrophyllex, p. 256.

Spigelia. Cal. 5-parted. Cor. funnel-form; border 5-cleft, equal. Anth. convergent. Caps. didymous, 2-celled, 4-valved, many-seeded. Spigeliacea, p. 238.

NICOTIANA. Cal. urceolate, 5-cleft. Cor. funnel-form, 5-cleft. Stig. emarginate. Caps. 2-celled, 2-valved. Solaneæ, p. 258.

Verbascum. Cal. 5-parted. Cor. rotate, 5-lobed, unequal. Stam. declined, often hairy. Caps. 2-valved, ovate or globose. Solanex, p. 259.

HYOSCYAMUS. Cal. tubular, 5-cleft. Cor. funnel-form, irregular; lobes obtuse. Stig. capitate. Caps. ovate, covered with a lid. Solanea, p. 259.

Convolvulus. Cal. 5-parted, naked or with 2 bracts at base. Cor. funnel-form or campanulate, plicate. Stig. capitate, lobed or divided. Caps. valved, 1—4-celled. Convolvulacex, p. 248.

(Capsules 3-5-celled.)

Phlox. Cal. deeply 5-cleft. Cor. salver-form; border 5-lobed, flat. Stam. inserted into the tube of the corol above the middle, very unequal. Caps. roundish, 3-celled; cells 1-seeded. Polemoniaceæ, p. 246.

Polemonium. Cal. campanulate, 5-cleft. Cor. rotate, 5-parted. Stam. inserted upon the five teeth or valves which close the orifice of corol. Polemoniaceæ, p. 247.

DIAPENSIA. Cal. 5-parted, subtended by 3 bracts. Cor. salver-form; border 5-cleft, flat. Stam. inserted into the tube and alternating with

the segments of the corol. Caps. 3-celled, 3-valved, many-seeded. Hydrolcaceae, p. 250.

AZALEA. Cal. 5-parted. Cor. short, campanulate, 5-cleft. Stam. equal, shorter than the corol. Anth. opening longitudinally. Caps. 5-celled, 5-valved, opening at the top. Ericea, p. 222.

*** Flowers 1-petalled, inferior. Fruit a berry.

Physalis. Cal. 5-cleft. Cor. rotate, 5-cleft. Stam. connivent. Ber. globose, covered by the inflexed calyx. Solanea, p. 257.

Solanum. Cal. 5-cleft. Cor. rotate, 5-cleft, spreading. Anth. opening with two pores at the top. Ber. subglobose, 2-4-celled. Solanca, p. 257.

NICANDRA. Cal. 5-parted, 5-angled, the angles compressed, segments sagittate. Cor. campanulate. Stam. incurved. Ber. 3—5-celled, covered by the calyx. Solanea, p. 258.

**** Flowers 1-petalled, superior. Fruit a capsule.

Campanulate, the base closed with 5 staminiferous valves. Stig. 3—5-cleft. Caps. 3—5-celled, opening laterally. Campanulaccæ, p. 213.

LOBELIA. Cal. 5-cleft. Cor. 5-parted, irregular, cleft on the upper side to near the base. Stam. united into a tube. Stig. 2-lobed. Caps. 2—3-celled. Lobeliacea, p. 214.

DIERVILLA. Cal. 5-cleft, bibracteate at the base. Cor. funnel-form, 5-cleft, spreading, much longer than the calyx. Stig. capitate. Caps. oblong, naked, acute, 1-celled, many-seeded. Caprifoliacca, p. 157.

**** Flowers 1-petalled, superior. Fruit a berry.

Lonicera. Cal. 5-toothed. Cor. tubular, campanulate or funnelform, 5-cleft, often irregularly. Stig. capitate. Ber. 3-celled, few seeded. Caprifoliacea, p. 157.

SYMPHORIA. Cal. minute, 4-5-toothed. Cor. funnel-form, subequally 4-5-lobed. Stig. subglobose. Ber. crowned by the calyx, 4-celled, 4-seeded; 2 cells sometimes abortive. Caprifoliacea, p. 159.

TRIOSTEUM. Cal. 5-cleft; lobes linear-lanceolate, nearly as long as the corol. Cor. tubular, 5-lobed, gibbous at base. Stig. capitate. Ber. 3-celled, 3-seeded, crowned by the calyx. Caprifoliaceæ, p. 157.

***** Flowers 4-6-petalled, inferior. Fruit a capsule.

ITEA. Cal. 5-cleft, campanulate. Pet. 5, linear, reflexed, spreading, inserted into the calyx. Stig. capitate, 2-lobed. Caps. 2-celled, 2-valved, many-seeded. Saxifragex, p. 139.

IMPATIENS. Sep. 5, the lower one spurred. Cor. 4-petalled, irregular; the 2 inner petals unequally bilobed. Stig. 5, united. Caps. prismatic-terete, elongated, 5-valved. Balsamincæ, p. 68.

VIOLA. Sep. 5, auricled at their base. Pet. unequal, lower one spurred. Anth. cohering at the top. Caps. 1-celled, 3-valved. Violacea, p. 37.

Solea. Sep. not auricled at base, decurrent into a pedicel. Pct. nearly equal; the lower a little larger and somewhat gibbous at base. Fil. with short broadish claws at base. Violaceæ, p. 41.

CLAYTONIA. Cal. 2-leaved or 2-parted. Pet. 5, obcordate or obovate,

unguiculate. Style 3-cleft. Caps. 1-celled, 3-valved, 3—5-seeded. Portulacea, p. 130.

Ceanorhus. Cal. 5-cleft, campanulate. Pct. 5, saccate and arched, with long claws. Stig. 3. Caps. 3-celled, 3-seeded, 3-parted, opening on the inner side. Rhamnex, p. 74.

Evonymus. Cal. 4—6-lobed, flat, covered at base by a peltate disk. Pet. 4—6, spreading, inserted into the disk. Caps. 3—5-celled, 3—5-angled; cells 1—4-seeded. Celastrinex, p. 71.

Celastrus. Cal. minute, 5-lobed. Pet. 5, unguiculate. Orary with 10 striæ, immersed in the disk. Caps. 2—3-valved; valves septiferous in the centre. Seed 1, covered with a large fleshy aril. Celastrineæ, p. 72.

****** Flowers 4-5-petalled, inferior. Fruit a berry.

VIIIs. Cal. about 5-toothed. Pet. 5, cohering at the top, deciduous. Stig. capitate, sessile. Ber. 2-celled, 4-seeded; cells and seeds often abortive. Ampelidex, p. 66.

Ampelorsis. Cal. nearly entire. Pet. 5. Stig. capitate. Orary not immersed in the disk, 2—4-seeded. Ampelidex, p. 65.

RHAMMUS. Cal. urceolate, 4—5-cleft. Pet. alternating with tlfe lobes of the calyx, or none. Stig. 2—4-cleft. Ber. 2—4-celled. Rhamneæ, p. 73.

****** Flowers 5-petalled, superior.

Ribes. Cal. campanulate, 5-cleft. Style 1—4-cleft. Bcr. 1-celled, many-seeded Grossulacex, p. 135.

****** Flowers incomplete.

Hamiltonia. Polygamous. Perianth turbinate-campanulate, 5-cleft. Stig. 2-3. Germ immersed in the 5-toothed glandulous disk. Drupe 1-seeded, inclosed in the adhering base of the calyx. Santalaceæ, p. 307.

Thesium. Perianth 4-5-cleft. Stam. 4-5, villous externally. Nut 1-seeded, covered by the persistent periantli. Santalaceæ, p. 307.

GLAUX. Cal. campanulate, 5-lobed, coloured. Cor. none. Caps. globose, 5-valved, 5-seeded, surrounded by the calyx. Primulaccæ, p. 289.

ANYCHIA. Cal. 5-parted; segments connivent, subsaccate, callous at the top. Cor. none. Fil. 3-5, distinct. Stig. 2, sub-capitate. Caps. indehiscent, 1-seeded, surrounded by the calyx. Illecebreæ, p. 131.

DIGYNIA.

* Flowers inferior. Corol 1-petalled.

APOCYNUM. Cal. very small, 5-cleft, persistent. Cor. campanulate; border with 5 short spreading or revolute lobes; the base furnished with 5 glandular teeth alternating with the stamens. Anth. sagittate. connivent, cohering to the stigma by the middle. Follicles long, distinct. Apocynex, p. 233.

Peripeoca. Cal. 5-cleft. Cor. rotate, flat, 5-parted; orifice surrounded with a 5-cleft crown, terminating in 5 filiform awns. Anth. piadex, p. 238.

Follicles 2, smooth, divaricate. Ascle-

GONOLOBUS. Cor. rotate, 5-parted. Stamineal crown, (nectary,)

scutelliform, lobed. Anth. opening transversely, terminated by a membrane. Pollinia (masses of pollen) 5-pairs, not separated into grains. Stig. depressed. Follieles 2, ventricose. Aselepiadeæ, p. 237.

Asclepias. Cal. small, 5-parted. Cor. 5-parted, mostly reflexed. Stamineal crown 5-leaved, concave, erect with a subulate process at the base of each. Stig. with 5 angles, opening by longitudinal chinks. Pollinia 5 distinct pairs. Follicles 2, ventricose. Asclepiadeæ, p. 235.

Gentiana. Cal. 4—5-cleft. Cor. bell- or funnel-form, tubular at the base, with the orifice naked. Stam. 4—5, included. Stig. 2-lobed. Caps. 1-celled, 2-valved. Gentianca, p. 239.

Cuscuta. Cal. 4—5-cleft. Cor. globose-urceolate; limb 4—5-lobed. Caps. 2-celled, opening all round transversely; cells 2-seeded. Convolvulaeea, p. 249.

** Flowers 5-petalled, inferior. .

Heuchera. Cal. 5-cleft, persistent. Pet. 5, inserted on the calyx. Caps. with 2 beaks, 1-celled, many-seed. Saxifrageæ, p. 139.

*** Flowers 5-petalled, superior.

Panax. Fl. polygamous, umbelled. Cal. obsolctely 5-toothed. Pet. 5. Styles 2-3, short. Fruit fleshy, compressed, orbicular or didymous, 2-celled. Araliaceæ, p. 151.

**** Flowers incomplete.

ATRIPLEX. Polygamous. Perfect Fl. Perianth 5-parted. Fruit depressed. Female Fl. Perianth 2-parted. Stam. none. Chenopodew, p. 296.

Chenopodium. Perianth inferior, 5-cleft, persistent, partly covering the fruit. Chenopodex, p. 295.

Salsola. Perianth inferior, 5-cleft, persistent, enveloping the fruit with its base and crowning it with its broad scariose limb. Embryo spiral. Chenopodex, p. 298.

ULMUS. Perianth inferior, campanulate, 4—5-cleft. Fruit compressed, with a broad membranaceous border. Ulmaeex, p. 333.

Celtis. Perfect or polygamous. Perianth inferior, 5-lobed. Drupe globose, 1-seeded. Ulmeea, p. 334.

***** Flowers 5-petalled, superior, 2-seeded.

Obs. The genera of this division form the Natural Order Umbelliferæ, p. 139.

TRIGYNIA.

* Flowers superior.

VIBURNUM. Cal. with the limb small, 5-toothed and persistent. Cor. rotate subcampanulate or tubular, 5-lobed. Ber. ovate or globose, 1-seeded, crowned by the teeth of the calyx. Caprifoliacæ, p. 155.

** Flowers inferior.

RHUS. Cal. small, 5-parted. Pet. 5, ovate, spreading. Drupe nearly dry, with one bony seed. Anacardiacea, p. 75.

STAPHYLEA. Cal. 5-parted, covered at base by an urceolate disk; lobes oblong, concave, coloured. Pet. 5, alternate with the sepals. Caps. 2—3-celled; cells membranaceous, inflated, united at base or throughout their whole length. Staphyleacex, p. 73.

TETRAGYNIA.

PARNASSIA. Cal. 5-sepalled. Pet. 5. Scales 5, terminating in glandular bristles at the apex. Caps. 1-celled, 4-valved. Seeds arillate. Droseracex, p. 43.

Nemopanthes. Fl. by abortion dioecious or polygamous. Cal. scarcely conspicuous. Pet. 5, distinct, oblong-linear, deciduous. Stig. 3-4, sessile. Ber. subglobose, 3-4-celled, 3-4-seeded. Ilicinee, p. 230.

PENTAGYNIA.

Aralia. Cal. 5-toothed, or entire, superior. Pet. 5. Ber. 5-10, seeded. Fl. in umbels. Araliaeeæ, p. 151.

STATICE. Cal. funnel-form, scariose, plaited. Pet. 5. Pericarp indehiscent. Plumbaginea, p. 292.

Linum. Cal. 5-parted, persistent. Pet. 5, unguiculate. Caps. subglobose, 10-valved, 10-celled. Seed solitary, ovate, compressed. Linea, p. 56.

SIBBALDIA. Cal. 10-cleft, with the alternate segments narrower. Pet. 5, minute. Styles proceding laterally from the germ. Seeds 5, clustered in the bottom of the calyx. Roaseeæ, p. 108.

Drosera. Cal. deeply 5-cleft. Pet. 5. Caps. superior, 3-celled, 3-5-valved, many-seeded. Droseracea, p. 42.

POLYGYNIA.

Zanthoriza. Cal. deciduous, 5-sepalled. Pet. 5. Caps. 2—3-seeded, by abortion 1-seeded. Ranunculaceæ, p. 14.

HEXANDRIA.

Monogynia.

* Flowers complete, having a ealyx and corol.

Tradescantia. Cal. 3-leaved. Pet. 3. Fil. villous. Caps. superior, 3-celled, many-seeded. Commelinea, p. 376.

Berbers. Cal. inferior, 6-sepalled. Pet. 6, with 2 glands upon their claws. Ber. 2—3-seeded. Berderidea, p. 17.

LEONTICE. Cal. 6-sepalled, naked without. Pet. 6, bearing a scale at the base. Caps. 2-4-seeded. Seeds globose, inserted into the bottom of the capsule. Berberidea, p. 17.

Prinos. Cal. minute, 6-cleft. Cor. 6-parted. Eer. 6-seeded. Hicinea, p. 230.

FLERKIA. Cal. 3-sepalled. Pet. 3, shorter than the sepals. Style bifid. Seeds 2 or 3, membranaceously coated, superior. Hydropeltidea, p. 19.

** Flowers issuing from a spathe.

AMARYLLIS. Perianth superior, 6-parted, petaloid, irregular. Fil. arising from the orifice of the tube, declined or straight, unequal. Amaryllidea, p. 354.

ALLIUM. Perianth inferior, 6-parted, generally spreading. Fl. in crowded umbels, arising from a 2-leaved spathe. Asphodeleæ, p. 363.

Hypoxis. Spathe 2-valved. Perianth superior, 6-parted, persistent.

Caps. elongated, narrowed at the base, 3-celled, many-seeded. Seeds roundish, naked. Hypoxidea, p. 354.

Pontederia. Perianth inferior, 6-parted, 2-lipped; under side of the tube with 3 longitudinal perforations. Stem. unequally inserted; 3 of them upon the summit of the tube. Caps. muricate, 1-seeded. Pontederea, p. 368.

*** Flowers with a single corol-like perianth.

ALETRIS. Perianth tubular-ovate, 6-cleft, wrinkled. Stam. inserted upon the orifice. Style 3-sided, 3-parted. Caps. half-superior, 3-celled, many-seeded. Asphodeleæ, p. 364.

LOPHICLA. Perianth 6-parted, woolly, bearded inside. Anth. erect. Fil. naked. Stig. simple. Caps. opening at the summit. Hamodoraeea, p. 374.

AGAVE. Perianth superior, tubular, funnel-form, 6-parted. Stam. longer than the corol, erect. Caps. triangular, many-seeded. Bromeliaeeæ, p. 375.

Henerocallis. Perianth large, persistent, campanulate, 6-cleft. Stam. declined. Stig. somewhat villous. Asphodelee, p. 362.

Ornithogalum. Perianth 6-parted, spreading above. Fil. dilated at the base. Asphodelea, p. 362.

NARTHECIUM. Perianth 6.parted, coloured. Fil. hairy. Caps. prismatic, 3-celled. Seed appendaged at each extremity. Juneev., p. 374.

ASPARAGUS. Perianth inferior, 6-parted. Style very short. Stig. 3. Ber. 3-celled; cells 2-seeded. Asphodelex, p. 363.

ERYTHRONIUM. Perianth campanulate, 6-parted; segments reflexed; the 3 inner ones usually with a callous tooth on each side near the base, and a nectariferous pore. Caps. superior, roundish, somewhat stiped. Liliaeeæ, p. 365.

Lilium. Perianth campanulate, deeply 6-parted; segments mostly reflexed, marked with a longitudinal nectariferous line. Stig. entire. Caps. superior, 3-sided. Liliaeeæ, p. 364.

UVULARIA. Perianth inferior, 6-parted, erect; segments with a nectariferous cavity at base. Fil. very short, growing to the anthers. Stig. reflexed. Caps. 3-sided, 3-celled, 3-valved. Seeds many, subglobose, arillate at the hilum. Smilaeex, p. 361.

SMILACINA. Perianth 6-parted, spreading. Stam. attached to the base of the segments. Ber. globose, 3-celled. Smilaeex, p. 357.

CLINTONIA. Perianth 6-parted, bell-form. Stam. inserted at the base. Style compressed. Stig. 2-lobed, compressed. Ber. 2-celled; cells many-seeded. Smilaeex, p. 358.

POLYGONATUM. Perianth 6-cleft, cylindrical. Stam. inserted on the upper part of the tube. Ber. 3-celled; cells 2-seeded. Smilaeea, p. 358.

STREPTOPUS. Perianth 6-parted; segments with a nectariferous pore at base. Anth. longer than the filaments. Stig. very short. Ber. subglobose, smooth, 3-celled. Seeds few. Smilaeeæ, p. 359.

**** Flowers with a single ealyx-like perianth, not spathed.

Orontium. Spad. cylindric, crowded with flowers. Perianth 6-petalled, naked. Style and stigma scarcely any. Caps. bladder-like, 1-seeded. Aroidea, p. 381.

Acorus. Spad. cylindric, covered with flowers. Periunth glumaceous, 6-petalled, naked. Stig. sessile, very minute. Caps. 3-celled, 3-angled. Aroidea, p. 381.

Juncus. Perianth inferior, glumaceous, 6-parted. Caps. 3-celled, 3-valved. Seeds many. Juncea, 371.

Luzula. Perianth 6-parted, glumaceous. Caps. superior, 3-celled, 3-valved; cells 1-seeded. Junea, p. 373.

TRIGYNIA.

Melanthium. Polygamous. Perianth rotate, 6-parted; segments with claws and 2 glands at the base of each; claws staminiferous. Caps. subovate, 3-celled; apex partly trifid. Sceds many, membranaceously winged. Melanthacca, p. 366.

Veratrum. Polygamous. Perianth 6-parted, spreading; segments sessile, without glands. Stam. inserted upon the receptacle. Caps. oblong, 2-valved, many-seeded. Mclanthacea, p. 368.

Helonias. Perianth 6-parted, spreading, without glands. Styles 3, distinct. Caps. 3-celled, 3-horned; cells few-seeded. Melanthaceæ, p. 367.

Xerophyllum. Perianth subrotate, deeply 6-parted. Fil. contiguous at base. Stig. 3, revolute, partly united below. Caps. subglobose, 3-celled; cells 2-seeded, opening at the top. Melanthaccae, p. 367.

Tofieldia. Perianth 6-parted, with a small 3-parted involucre. Caps. 3—6-celled; cells many-seeded. Melanthacea, p. 366.

Scheuchzeria. Perianth 6-parted. Anth. linear. Stig. sessile, lateral. Caps. inflated, 2-valved, 1—2-seeded. Juncaginca, p. 379.

TRIGLOCHIN. Perianth of 6 deciduous leaves, 3 inserted above the rest. Stam. very short. Caps. 3—6, united by a longitudinal receptacle. Juncaginea, p. 378.

Medeola. Perianth 6-parted, revolute. Stig. 3, divaricate, united at the base. Ber. 3-celled; cells 3—6-seeded. Smilacea, p. 360.

TRILLIUM. Perianth 6-parted; 3 outer segments resembling a calyx; 3 inner petaloid. Stig. 3, sessile. Ber. superior, 3-celled; cells many-seeded. Smilacca, p. 360.

Rumex. Perianth 6-leaved. Nut triquetrous, covered by the 3 inner valviform leaves of the perianth. Stig. many-cleft. Polygoneæ, p. 303.

TETRAGYNIA.

SAURURUS. Fl. in an ament or crowded spike. Scales 1-flowered. Cor. none. Anth. adnate to the filaments. Caps. 4, each 1 or rarely 2-seeded. Saurureæ, p. 317.

POLYGYNIA.

ALISMA. Cal. 3-leaved. Cor. 3-petalled. Caps. many, clustered, distinct, 1-seeded, not opening. Alismacea, p. 378.

HEPTANDRIA.

Monogynia.

TRIENTALIS. Cal. 7-parted. Cor. 7-parted, regular and flat. Ber. dry, opening at the suture, many-seeded. Primulacca, p. 289.

Æsculus. Cal. campanulate. Pet. 4—5, expanded. Fil. recurved backwards. Caps. echinate. Hippocastance, p. 65.

OCTANDRIA.

Monogynia.

* Flowers superior.

RHEXIA. Cal. ventricose-ovate at base; limb 4-cleft. Pet. 4, obovate. Caps. included in the calyx, 4-celled. Seeds numerous, cochleate. Melastomacea, p. 127.

Oenothera. Cal 4.sepalled; sepals united into a long 4-sided or 8-ribbed tube; limb and part of the tube caducous. Cor. 4-petalled. Stig. 4-cleft, or spherical. Caps. 4-celled, 4-valved, many-seeded. Onagrariæ, p. 117.

Gaura. Cal. 3-4-sepalled; sepals united into a long obovate tube; limb caducous. Cor. 3-4-petalled. Seeds 1-4, not crowned with pappus. Onagraria, p. 117.

Epilobium. Cal. 4-sepalled; sepals united into a long 4-sided tube; limb caducous. Pet. 4. Caps. elongated, 4-celled, 4-valved, many-seeded. Seeds crowned with pappus. Onogravia, p. 116.

Oxycoccus. Cal. superior, 4-cleft. Cor. 4-parted; segments sublinear and revolute. Fil. converging. Anth. tubular, 2-parted. Ber. many-seeded. Vaccinea, p. 225.

** Flowers inferior.

Mexziesia. Cal. deeply 5-cleft. Cor. ovate, 4—5-cleft. Stam. inserted into the receptacle. Caps. 4—5-celled, the partitions formed by the inflexed margins of the valves. Seeds numerous, oblong. Ericeae, p. 218.

Acer. Fl. mostly polygamous. Cal. 5-lobed, or 5-parted. Pet. 5, or none. Caps 2, each with a long membranous expansion, (samara) united at base, 1-seeded. Acerinee, p. 63.

Direca. Perianth coloured, campanulate; border obsolete. Stam. unequal, exserted. Ber. 1-seeded. Thymclea, p. 306.

JEFFERSONIA. Cal. 4-sepalled. Pct. 8. Caps. obovate, opening below the top by semicircular foramen. Seeds many, arillate at base. Podophyllea, p. 18.

TRIGYNIA.

Polygonum. Perianth 4—6-parted, petaloid, persistent. Nut 1-seeded, mostly triangular. Polygonea, p. 300.

ENNEANDRIA.

MONOGYNIA.

LAURUS. Perianth 4-5-cleft, equal. Stam. 8-12, in a double row; outer ones all fertile; alternate inner ones fertile and furnished at base with 2 appendices or glands, (nectary.) Drupe fleshy. Laurineæ, p. 305.

DECANDRIA.

Monogynia.

* Flowers regular.

VACCINIUM. Cal. superior, 4-5-toothed. Cor. urceolate or cam-

panulate, 4—5-cleft. Fil. inserted upon the germ. Ber. globose, 4—5-celled, many-seeded. Vaccinex, p. 223.

Obs. The remaining genera of this division are included in the Natural Orders, Ericea, p. 215, and Pyrolacea, p. 225.—(Leiophyllum, omitted in its proper place, is described in the Appendix, p. 463.)

** Flowers irregular.

Cassia. Sep. 5, scarcely united at base, somewhat unequal. Pet. 5, subequal. Stam. unequal; 3 upper ones sterile; 3 lowest beaked, upon longer and incurved filaments. Legume membranaceous, 2-valved. Leguminosæ, p. 93.

Baptisia. Cal. half 4 or 5-cleft, bilabiate. Cor. papilionaceous. Pct. nearly equal in length. Stand. with the sides reflexed. Stam. deciduous. Leg. ventricose, pedicelled, many-seeded. Leguminosa, p. 77.

Cercis. Cal. 5-toothed, gibbous at base. Pet. 5, with claws, sub-papilionaceous, all distinct; wings large. Leg. compressed; upper seminiferous suture margined. Seeds obovate. Leguminosæ, p. 94.

DIGYNIA.

Hydrangea. Cal. superior, hemispheric, 5-toothed. Pet. 5, regular. Caps. 2-celled, 2-beaked, opening by a hole between the 2 horns. Saxifragea, p. 137.

SAXIFRAGA. Cal. 5-parted. Pet. 5, entire, with short claws. Caps. with 2 beaks, 2-celled, many-seeded, opening between the beaks. Saxifragea, p. 137.

Chrysosplenium. Cal. superior, 4—5-cleft, coloured. Cor. none. Caps. with 2-beaks, 2-valved, many-seeded. Saxifragea, p. 138.

Tiarella. Cal. 5-parted, persistent. Pet. 5, inserted into the calyx, unguiculate, entire. Caps. 1-celled, 2-valved; valves unequal. Saxifrageæ, p. 138.

MITELLA. Cal. campanulate, 5-cleft. Pet. 5, laciniate or toothed, inserted into the calyx. Caps. 1-celled, 2-valved; valves equal. Saxifragea, p. 138.

SAPONARIA. Cal. tubular, 5-toothed, naked at the base. Pet. 5, unguiculate. Caps. 1-celled. Caryophyllee, p. 49.

DIANTHUS. Cal. tubular, 5-toothed, with 2-4 imbricated scales at the base. Pct. 5, with long claws. Caps. 1-seeded. Caryophyllee, p. 47.

Scleranthus. Cal. 5-cleft, with the stam. inserted upon it. Cor. none. Caps. 1-celled, covered with the calyx. Scleranthea, p. 132.

TRIGYNIA.

SILENE. Cal. tubular, 5-toothed, naked. Pet. 5, unguiculate, mostly crowned at the orifice; limb bifid. Caps. 3-celled at base, dehiscent at the top into 6 teeth. Caryophylleæ, p. 47.

STELLARIA. Cal. 5-parted. Pet. 5, bifid. Caps. 1-celled, opening with 6 teeth, many-seeded. Caryophyllex, p. 50.

ARENARIA. Cal. 5-sepalled. Pet: 5, entire. Caps. 1-celled, many-

PENTAGYNIA.

SEDUM. Cal. 5-parted. Pet. 5. Caps. 5, with a nectariferous scale at their base. Crassulacea, p. 133.

Oxalis. Cal. 5-parted, persistent. Pet. 5. Caps. 5-angled, 5-celled, bursting at the angles. Secds covered with an elastic aril. Oxalidex, p. 69.

AGROSTEMMA. Cal. 1-leaved, tubular, coriaceous, 4-sided. Pet. 5, clawed; limb undivided. Caps. 1-celled. Caryophyllea, p. 49.

Cerastium. Cal. 5-parted. Pet. 5, bifid. Caps. 1-celled, dehiscent at the apex with 5 or 10 teeth. Caryophyllex, p. 53.

Spergula. Cal. 5-parted. Pet. 5, undivided. Caps. ovate. Caryophyllea, p. 50.

PENTHORUM. Cal. 5-parted. Pet. 5 or none. Caps. 5-pointed, 5-celled, 5-sided at the apex. Crassulacea, p. 133.

DECAGYNIA.

PHYTOLACCA. Perianth 5-leaved, petaloid. Ber. superior, 10-celled, 10-seeded. Phytolaccex, p. 299.

ICOSANDRIA.

Monogynia.

Oruntia. Cal. many-sepalled; outer sepals flat, short; inner ones petal-like, obovate, rosaceous. Ber. ovate, umbilicate at the apex, tuberculate and often bearing spines. Cactea, p. 134.

Prunus. Cal. inferior, 5-toothed. Cor. 5-petalled. Drupe ovate or oblong, fleshy, very smooth, covered with greyish dust; putamen compressed, acute at both ends, subsulcate at the margin, elsewhere smooth. Amygdalew, p. 95.

Cerasus. Drupe globose or umbilicate at base, fleshy, very smooth, destitute of grey powder; nucleus subglobose, smooth. Amygdalex, p. 96.

LYTHRUM. Cal. cylindric, striate, 8-12-toothed. Pet. 4-6, equal, inserted on the calyx. Caps. 2-celled, many-seeded. Salicaria, p. 125.

Cuphea. Cal. inflated, tubular, 6-12-toothed, unequal. Pct. 6-7, unequal, inserted into the calyx. Caps. 1-2-celled, at length bursting longitudinally. Salicaria, p. 126.

Decopor. Cal. hemispheric-campanulate, 10-toothed; 5 teeth longer and spreading. Pet. 5, undulate. Caps. covered with the calyx, 3-celled, 3-valved. Salicaria, p. 126.

DI-PENTAGYNIA.

(From Order 2 to Order 5 inclusive.)

Sesuvium. Cal. 5-parted, coloured. Pet. none. Stig. 3-5. Caps. superior, 3-5-celled, opening circularly, many-seeded. Ficoidea, p. 134.

Obs. The remaining genera of this division belong to the Orders Rosacea, (p. 98,) and Pomacea, (p. 110.)

POLYGYNIA.

Calycanthus. Lobes of the cal. in many rows, imbricate, lanceolate, somewhat coriaceous, coloured. Cor. none. Stam. unequal. Acines many. Calycanthea, p. 115.

OBS. All the other genera of this order are included under Rosacea, p. 98.

4a

POLYANDRIA.

Monogynia.

Tilia. Cal. 5-parted, inferior, deciduous. Pet. 5, naked, or with a scale within. Caps. coriaceous, 5-celled; cells 2-seeded, (rarely 1-celled, 1-seeded.) Tiliaccæ, p. 59.

Helianthemum. Cal. 5-leaved, 2 smaller than the rest. Cor. 5-petalled. Caps. 1-celled, 3-valved; valves septiferous in the middle. Cistinca, p. 35.

Hudsonia. Cal. tubular, 5-parted, unequal, inferior. Cor. 5-petalled. Stam. 9-30. Caps. 1-celled, 3-valved, 1-3-seeded. Cistinea, p. 36.

PORTULACCA. Cal. inferior, 2-parted. Pet. 4—6. Caps. 1-celled, opening circularly. Portulacea, p. 130.

Talinum. Cal. of 2 ovate sepals. Cor. 5-petalled. Caps, 1-celled, 3-valved, many-seeded. Receptacle globose. Portulacea, p. 130.

Chelidonium. Schals 2, smooth. Pet. 4. Caps. elongated, 1-celled, 2-valved. Secds numerous, crested, free. Papaveracce, p. 21.

Meconorsis. Pet. 4. Stig. 4—6-rayed. Caps. obovate, 1-celled, 4—6-valved. Papavcracca. p. 21.

Argemone. Pet. 4-6. Stig. 4-7, radiating, free. Caps. obovate, 1-celled, opening at the summit by valves. Papareracea, p. 21.

Sanguinaria. Sep. 2, deciduous. Pet. 8—12. Stig. 2. Caps. superior, oblong, 2-valved Papaveracea, p. 21.

Podophyllum. Sep. 3. Pet. 6-9. Stig. large, subsessile, peltate-Ber. somewhat fleshy, not dehiscent. Podophyllea, p. 18.

ACTEA, Cal. 4-leaved, deciduous. Pet. 4. Carpels many-seeded. Ranunculacea, p. 13.

Sarracenia. Cal. double, persistent; outer one of 3 leaves; inner one of 5, much larger. Pet. 5. Stig. very large, peltate, covering the stamens. Caps. 5-celled. Sarracenia, p. 22.

NYMPHEA. Sep. at the base of the disk. Pet. and stam. connected with the whole of the disk, which covers the carpels. Nymphaacca, p. 20.

NUPHAR. Sep., pet. and stam. inserted at the base of the disk. Nymphaecea, p. 20.

DI-PENTAGYNIA.

ASCYRUM. Cal. 4-sepalled; the 2 inner larger and cordate: Pet. 4. Stam. scarcely united at base. Styles 1-3. Hypericineae, p. 62.

Hypericum. Sep. 5, unequal, more or less united at base. Pet. 5. Stam. in 3 or 4 parcels. Styles 3-5. Caps. membranaceous. Hypericineae, p. 60.

OBS. The other genera belong to Ranunculacea, p. 3.

POLYGYNIA.

MAGNOLIA. Sep. 5. Pet. 6-9. Carpels 2-valved, 1-seeded, imbricated in a cone. Seeds pendulous, arillate. Magnoliacea, p. 14.

LIRIODENDRON. Sep. 3. Pet. 6. Samara, (wing-like carpels,) 1 or

2-seeded, imbricate in a cone, not opening, attenuated. Magnoliacca, p. 15.

ASIMINA. Cal. 3-parted. Pet. 6, spreading, ovate-oblong; the inner smaller. Anth. subsessile. Bcr. several, ovate, sessile, many-seeded. Anonacea, p. 16.

Hydropeltis. Cal. of 3-4 sepals. Pet. 3-4. Ovaries 6-18 Seeds pendulous, ovate, globose. Hydropeltidex, p. 18.

NELUMBIUM. Cal. petaloid, of 4-6 sepals. Pet. numerous. Carp. numerous, deeply immersed in the upper surface of a turbinate receptacle or torus, 1-seeded. Nymphaacea, p. 19.

Oss. The remaining genera belong to the Order Ranunculacea, p. 3.

DIDYNAMIA.

2 orders. 1. Gymnospermia. Seeds naked.

2. Angiospermia. Seeds in a capsule.

Obs. The genera of this class form a very natural group, having irregular or bilabiate flowers, with mostly 4 stamens (2 longer); but sometimes 2 are abortive, and hence such are arranged artificially in the class Diandria. The whole will be more easily, as well as correctly studied, by the natural orders. The genera belonging to the order Gymnospermia will be found among the Labiate, p. 270; those belonging to Angiospermia among the Orobanchew, p. 260, Scrophularinew, p. 261, and Verbenacew, p. 283.

TETRADYNAMIA.

Obs. This class is entirely natural; and it is therefore altogether unnecessary to repeat the generic descriptions. It is identical with the natural order Crucifera, p. 24. I have chiefly for the sake of convenience, preserved the Linnæan division into Siliculosa and Siliquosa.—Gynandropsis and Polanisia, (Cleome Linn.) usually arranged under this class, form the order Capparidea, p. 34.

MONADELPHIA.

PENTANDRIA.

Passiflora. Cal. 5-parted, coloured. Pet. 5, or none, inserted into the calyx. Nect. a filamentous crown. Ber. pedicelled. Passiflorea, p. 129.

DECANDRIA.

Geranium. Sep. 5, equal. Pet. 5, equal, 5 alternate stam. longer, with nectariferous scales at the base. Fruit beaked, separating into 5 1-seeded capsules, each with a long naked simple awn. Geraniaceæ, p. 67.

POLYANDRIA.

OBS. The genera of order from the Natural Order Malvaceae, p. 56.

DIADELPHIA.

HEXANDRIA.

Obs. The succeeding genera belong to the Natural Order Fumariacea, p. 22.

OCTANDRIA.

Polygala. Cul. 5-leaved, 2 of them wing-shaped and coloured. Caps. compressed, oboyate or obcordate, 2-celled, 2-valved. Seeds pubescent. Polygalex, p. 44.

DECANDRIA ..

Obs. The genera of this order, with a few usually arranged under the class Decandria, constitute the Leguminosa, p. 76.

SYNGENESIA.

OBS. The plants of this class, with a few exceptions, have 5 anthers united into a single tube. They are further characterized by the flowers, commonly called florets, being clustered together in heads and inserted upon a common receptacle which is surrounded by an involucre; being usually known as compound flowers. They form the Natural Order Composite, p. 165.

GYNANDRIA.

Obs. The orders Monandria and Diandria of this class, constitute the Orchidea, p. 342.

HEXANDRIA.

Aristolochia. Perianth tubular, ventricose at base, dilated at the apex and ligulate. Caps. inferior, 6-celled, many seeded. Aristolochia, p. 308.

DODECANDRIA.

Asarum. Perianth campanulate, 3-cleft. Anth. adnate to the middle of the filaments. Caps. inferior, 6-celled. Aristolochiæ, p. 309.

MONOECIA.

MONANDRIA.

ZOSTERA. Stam. and Pist. separated, in two rows on one side of a spadix. Spathe leafy. Perianth none. Sterile Fl. Anth. ovate sessile, alternating with the germs. Fertile Fl. Ovary 1, ovate. Style bifid. Drupe 1-seeded. Fluviales, p. 384.

Zannichellia. Sterile Fl. Perianth none. Fertile Fl. Perianth single, 1-leaved. Style 1. Stig. peltate. Caps. sessile. Fluviales, p. 384.

Caulinia. Perianth none. Sterile Fl. Anth. sessile. Fertile Fl. Style filiform. Stig. 2-cleft. Caps. 1-seeded. Fluviales, p. 384.

Euphorbia. Perianth mostly wanting, Invol. 1-leaved, campanulate, 8 to 10 toothed, the inner segments membranaceous and erect. Sterile Fl. 12 or more. Fil. articulated in the middle. Fertile Fl. solitary, stipulate, naked. Caps. 3-lobed. Euphorbiacea, p. 311.

DIANDRIA.

Podostemum. Cal. and Cor. none. Sterile Fl. Stam. 2, affixed to a common pedicel. Fertile Fl. Germ ovate. Stig. 1, sessile. Caps. 2-celled, 2-valved, many-seeded. Seeds minute. Podostemea, p. 124.

TRIANDRIA.

Spargantum. Fl. in spherical heads. Perianth 3-leaved. Drupe dry, 1-seeded. Typhacea, p. 379.

CAREX. Fl. collected into an imbricated ament. Glume 1-flowered.

Cor. (nectary or perianth) ventricose, 1-valved, persistent, enclosing the coriaceous nut or caryopsis. Cyperaceæ, p. 430.

TYPHA. Fl. forming a long cylindrical dense spike. Sterile Fl. Perianth none. Stamens 3, united below into 1 filament. Fertile Fl. Perianth none. Pericarp pedicellate, surrounded at base with hairs resembling a pappus. Typhacea, p. 380.

Science. Sterile Fl. Glumes 2 or 6, many-flowered. Paleæ unarmed. Fertile Fl. Glumes 2 or 6, 1-flowered. Paleæ none. Stig. 1—3. Nut coloured, subglobose. Cyperaceæ, p. 430.

TRIPSACUM. STERILE FL. Glume 2 flowered; outer one sterile; inner neutre. Cor. a membranous glume. Fertile Fl. Glume 1-flowered, surrounded by a 1-leaved involucre, perforated near the base. Cor. a 2-valved glume. Style 2. Seed 1. Graminex, p. 399.

Comptonia. Sterile Fl. Ament cylindrical; scales 1-flowered. Perianth 2-parted. Fertile Fl. Ament globose; scales 1-flowered. Styles 2. Nut ovate, 1-celled. Amentacea, p. 324.

TETRANDRIA.

ERIOCAULON. Fl. collected into a compact scaly head. STERILE Fl. in the disk. Perianth single, 4-cleft; the two inner segments united nearly to their summit. Stamens 4—6. FERTILE Fl. in the margin. Perianth single, deeply 4-parted. Style 1. Stig. 2—3. Caps. 2—3 lobed, 2—3 celled: cells 1-seeded. Restiaceæ, p. 369.

ALNUS. STERILE FL. Ament long cylindrical; scales 3-lobed, 3-flowered. Perianth single, 4-parted. Fertile Fl. Ament ovate; scales 2-flowered. Perianth none. S/yles 2. Nut compressed. Amentacea, p. 326.

BOEHMERIA. STERILE FL. Perianth 4-parted. Fertile Fl. Perianth none. Style 1. Nut compressed. Urlicea, p. 315.

URTICA. STERILE FL. Perianth single, 4-leaved. FERTILE FL. Perianth 2-leaved. Nut 1, shining. Urticeæ, p, 313.

Parietaria. Fl. polygamous. Perfect Fl. Perianth 4-cleft. Stamens elastic. Style 1. Nut 1, enclosed by the enlarged perianth. Urticee, p. 315.

Morus. Perianth 4-parted; lobes concave. Fertile Fl. Styles 2. Seeds 1-2, covered by the fleshy perianth. Artocarpeæ, p. 316.

PENTANDRIA.

Crotonopsis. Sterile Fl. Perianth 5-parted, with 5 petaloid scales. Fertile Fl. Perianth 5-parted. Stig. 3, twice bifid. Caps. 1-seeded, not opening. Euphorbiaceæ, p. 310.

AMARANTHUS. Perianth 2 to 5-leaved. STERILE FL. Stam. 3-5. FERTILE FL. Styles 3. Caps. 1-celled, 1-seeded, opening transversely all round. Amaranthaceæ, p. 294.

XANTHIUM. STERILE FL. Involucre imbricate. Anth. approximate but not united. Recept. chaffy. Fertile Fl. Invol. 2-leaved, 1-flowered. Cor. none. Nut 2-celled. Composita, p. 210.

Ambrosia. Sterile Fl. Involucre 1-leaved, hemispherical. Anth. approximate but not united. Recept. naked. Fertile Fl. Invol. 1-leaved, entire or 5-toothed, 1-flowered. Cor. none. Nut formed from the indurated calyx, 1 seeded. Composita, p. 209.

HEXANDRIA.

ZIZANIA. Glume none. Sterile Fl. Palex 2, subawned. Fertile Fl. Palex 2, cucullate and awned. Style 2-parted. Seed 1, invested by the plaited palex. Graminex, p. 419.

Hydrochloa. Glume none. Sterile Fl. Palea 2, awnless. Fertile Fl. Palea 2, awnless. Stig. 2, very long. Seed 1, reniform. Graminea, p. 419.

POLYANDRIA.

(Stems not woody.)

Ceratophyllum. Cal. many-parted. Sterile Fl. Cor. none. Stam. 16—20. Anth. tricuspidate. Fertile Fl. Cor. none. Style 1, filiform. Nut 1-seeded. Ceratophylleæ, p. 124.

Myriophyllum. Sterile Fl. Cal. 4-parted. Cor. 4-petalled. Stam. 4-6-8. Fertile Fl. Cal. adhering to the ovary; limb 4-lobed. Pet. none. Nuls 4, compressed or subglobose, 1-seeded. Halorageæ, p. 121.

SAGITTARIA. Cal. 3-leaved. Pet. 3. STERILE FL. Stam. about 24. FERTILE FL. Ovaries numerous. Caps. compressed, margined, 1-seeded. Alismacex, p 376.

ARUM. Spathe 1-leaved, cucullate, convolute at the base. Spad. naked above, bearing sessile anthers below the middle and ovaries at the base. Ber. 1-celled, many-seeded. Aroidea, p. 381.

Rensselaeria. Spathe convolute. Spad. covered with flowers, fertile at the base, sterile above. Perianth none. Ber. 1-seeded. Aroidea, p. 382.

Calla. Spathe ovate, somewhat flattened. Spad. covered with flowers. Perianth none. Ber. many-celled, many-seeded. Aroidex, p. 282.

(Stems woody.)

OBS. The genera of this division are Forest Trees, and are included under the Nat. Ord. Amentacea, p. 317.

MONADELPHIA.

(Stems not woody.)

ACALYPHA. STERILE FL. Perianth 3 or 4-parted. Stam. 8-16. Fertile Fl. Styles 3, 2-parted. Caps. 3-celled, 3-seeded. Euphorbiacea, p. 311.

RIGINUS. STERILE FL. Perianth 5-parted. Stam. numerous. Ferrate, 3-celled, 3-seeded. Euphorbiacea, p. 311.

PHYLLANTHUS. STERILE FL. Perianth 5-6-parted. Fil. often columnar. Fertile Fl., resembling the sterile. Nectary? a 12 angled margin. Styles 3. Caps. mostly 3-grained. Euphorbiaceæ, p. 310.

Melothria. Sterile Fl. Cal. 3-5-toothed. Cor. bell-form. Fil. 5, in 3 sets. Fertile Fl. Cal. and cor. as in the sterile. Style 1. Stig. 3. Fruit 3-celled, many-seeded. Cucurbitacca, p. 128.

Momordica. Sterile Fl. Cal. 5 cleft. Cor. 5 parted. Stam. in sets. Fertile Fl. Style 3-cleft. Ovary 3-celled. Fruit often muricate. Cucubitacea, p. 128.

Sicros. STERILE Fi. Cal. 5-toothed; teeth subulate, 5-parted.

Fil. 3? FERTILE FL. Style 3-cleft. Fruit 1-seeded, often spiny. Cucurbitacea, p. 128.

(Stems woody.)

OBS. The genera of this division belong to Conifera, p. 337.

DIOECIA.

DIANDRIA.

Vallisheria. Sterile Fl. Spathe ovate, 2—4-parted. Spad. covered with minute flowers. Perianth 3-parted. Fertile Fl. Spathe 2-cleft, 1-flowered. Perianth elongated, 6-parted. Stig. 3, sessile, ovate, bifid. Caps. cylindric, 1-celled, many-seeded. Hydrocharidea, p. 341.

Salix. Sterile Fl. Ament cylindric. Scales 1-flowered, with a nectariferous gland at the base. Perianth none. Stam. 1—5. Fertile Fl. Scales 1-flowered. Perianth none. Stig. 2. Caps. 1-celled, 2-valved, many-seeded. Sceds woolly. Amentacea, p. 318.

Frankings. Cal. none, or 3-4-cleft. Cor. none, or deeply 4-parted. Stam. 2. Caps. 2-celled, 2-seeded, compressed and foliaceous at the extremity. Polygamous. Oleacea, p. 232.

TRIANDRIA.

Empetrum. Perianth consisting of 2 rows of scales. Sterile Fl. Stam. 3. Fertile Fl. Stig. with 6-9 spreading rays. Ber. round, superior, 6-9-sceded. Empetrea, p. 309.

TETRANDRIA.

Myrica. Ament ovate-oblong; scales lunulate. Sterile Fl. Stam. 4—6. Anth 4-valved. Fertile Fl. Ovary 1. Stig. 2 Drupe 1-celled, 1-seeded. Amentaceα, p. 324.

VISCUM. Cal. with the margin entire or a little prominent. Sterile Fl. Pet. 4, united at base. Anth. 4, adnate with the petals. Fertile Fl. Pet. 4, distinct. Stig. 1, obtuse, sessile. Ber. globose, mucilaginous, 1-seeded. Loranthacea, p. 154.

PENTANDRIA.

NYSSA. STERILE FL. Perianth 5-parted. Stam. 5-10. Perfect Fl. Perianth 5-parted. Stem 5. Style 1. Drupe inferior. Santalacew, p. 307.

ZANTHOXYLUM. Cal. 3-9-lobed, often 4-5-parted. Pet. as many as the lobes of the calyx, rarely none. Stam. and carp. as many as the lobes of the calyx. Zanthoxylea, p. 70.

Acnida. Sterile Fl. Perianth 5-parted. Fertile Fl. Per. 3-parted. Stig. 3-5, sessile. Caps. 1-seeded. Chenopodea, p. 297.

Humulus. Sterile Fl. Perianth 5-parted. Anth. with 2 pores at the extremity. Fertile Fl. Scales of the ament large, concave, entire, 1-flowered. Per. none. Styles 2. Seed 1. Urticea, p. 315.

Cannabis. Sterile Fl. Perianth 5-parted. Fertile Fl. Per. oblong, opening at the side. Styles 2. Nut 2-valved, covered by the closed perianth. Urticea, p. 315.

HEXANDRIA.

SMILAX. Perianth campanulate-spreading, 6-parted. STERILE FL.

Anth. adnate to the filaments. FERTILE FL. Stig. 3. Ber. globose, 3-celled. Smilacea, p. 356.

Dioscorea. Perianth 6-parted. Fertile Fl. Styles 3. Caps. 3-celled, triangular, compressed; cells 2-seeded. Seeds with membranaceous margins. Dioscoreα, p. 355.

GLEDITSCHIA. Sepals 3-4-5, equal. Pet. as many as the sepals, arising from the tube of the calyx. Style short. Stig. pubescent. Legume compressed, 1 or many-seeded. Seeds compressed. Leguminosæ, p. 93.

OCTANDRIA.

Populus. Ament cylindrical; scales lacerated. Sterile Fl. Anth. 8-30, arising from a turbinate, oblique, entire, single perianth. Fertile Fl. Per. turbinate. Stig. 4. Caps. superior, 2-celled, 2 valved, many-seeded. Seeds woolly. Amentaceæ, p. 322.

DIOSPYROS. Calyx 4—6 cleft. Cor. urceolate, 4—6 cleft. Sterile Fl. Stam. 8—16; fil. often producing 2 anthers. Fertile Fl. like the sterile. Stig. 4—5. Ber. 8—12 seeded. Ebenacex, p. 229.

SHEPHERDIA. STERILE FL. Perianth 4-cleft. Stam. 8, included, alternating with 8 glands. Fertile Fl. Per. 4-cleft, bell-form, superior. Style 1. Stig. oblique. Ber. 1-seeded. Elwagnew, p. 306.

ENNEANDRIA.

Uddra. Spathe bifid. Perianth 6-parted; 3 inner segments petaloid. Sterile Fl. Stam. 9, 3 of them interior. Fertile Fl. Tube of the perianth very long. Sterile fil. 3. Caps. bladder-like, about 3-seeded. Seeds cylindric. Hydrocharideæ, p. 342.

DECANDRIA.

GYMNOCLADUS. Cal. tubular, 5-cleft. Cor. 5-petalled. Legume oblong, thick, pulpy within. Leguminosæ, p. 93.

POLYANDRIA.

Menispermum. Sepals and pet. arranged in fours, 2 or 3-rowed. Sterile Fl. Stam. 16-20. Fertile Fl. Ovaries 2-4. Drupe berried, roundish-reniform, 1-seeded. Menispermaceæ, p. 16.

MONADELPHIA.

JUNIPERUS. STERILE FL. Ament ovate; scales whorled and peltate. Anth. 4-8, 1 celled. Ferrile Fl. Ament globose; scales 3, coadunate. Stig. gaping. Ber. with 3 bony 1-seeded nuts, surrounded with the united and fleshy scales. Conifera, p. 337.

Taxus. Fl. surrounded with numerous scales. Sterile Fl. Stam. 8-10. Anth. peltate. Fertile Fl. Style none. Stig. concave. Drupe fleshy, open at the extremity. Nul 1 seeded. Conifera, p. 341.

CRYPTOGAMIA.

FILICES.

OBS. This order forms the Filicoideæ, or Fern-like plants, p. 445.

TABLE

OF THE

NATURAL ORDERS:

Showing the accordance of the Systems of Jussieu and De Candolle.

TABLE OF THE NATURAL ORDERS.

VASCULARES OR FLOWERING PLANTS.

PLANTS

OF THE

NORTHERN AND MIDDLE STATES.

ARRANGED ACCORDING TO

THE NATURAL SYSTEM.

VASCULARES, OR FLOWERING PLANTS.

PLANTS furnished with flowers, and spiral vessels—Phæno-GAMOUS OF PHANEROGAMOUS PLANTS of Authors.

CLASS I. EXOGENÆ OR DICOTYLEDONOUS PLANTS.

Trunk more or less conical, consisting of three parts, one within the other, viz. bark, wood and pith, of which the wood is enclosed within the two others; increasing by an annual deposit of new wood and cortical matter, between the wood and bark. Leaves always articulated with the stem, their veins branching and reticulated. Embryo with two or more opposite cotyledons, which often become green and leaf-like after germination; radicle naked; i. e. elongating into a root without penetrating any external case.

SUBCLASS I. THALAMIFLORÆ. De Cand.

Calyx many sepalled. Petals many, distinct, and with the stamens inserted into the receptacle.

ORDER I. RANUNCULACEÆ. De Cand. Lind.

Calyx with many definite sepals, or many-parted. Petals 5-15, (sometimes wanting,) in one or more rows, distinct. Stamens indefinite in number; anthers adnate, generally turned outwards. Pistils numerous. Fruit either consisting of dry nuts or carpels, or baccate with one or more seeds, or follicular with one or two valves. Seeds albuminous; when sol-

itary, either erect or pendulous. Embryo minute. Albumen corneous, large.

Herbs or Undershrubs. Leaves simple, often variously lobed, with petioles, more or less dilated at their base.

1. CLEMATIS. Linn.

Involucre none, or like a calyx under the flower. Sepals 4—8, coloured. Petals none, or shorter than the sepals. Carpels many, terminated by a long, mostly feathery awn.

Polyandria. Polygynia.

1. C. virginiana Linn.: stem climbing; leaves ternate; leafets cordate-ovate, acute, coarsely toothed or lobed; flowers paniculate, diœcious.

Hab. Can. to Flor. N. to lat. 55° W. to Columbia river. Aug. b.—Stem long. Flowers white, in large panicles. Tails of the carpels at length clothed with long silken hairs, having the appearance of tufts of wool.

Virgins Bower.

2. C. riorna Linn.: stem elimbing; leaves pinnately divided; segments entire, or 3-lobed, ovate, acute; floral ones entire; peduncles 1-flowered; sepals thick, acuminate, connivent, reflexed at the apex.

HAB. Woods. Penn. to Geor. W. to Miss. June, July. 21.—Flowers large, nodding, violet. Tails of the carpels long, plumose.

3. C. ochroleuca Ait.: herbaceous, ereet, simple, pubescent; leaves simple, ovate, very entire, the younger ones with the calyx silky; flower peduncled, terminal, solitary, nodding.—C. sericea Mich.

Hab. Woods. Penn. to Geor. June. 21.—Stem 12—18 inches high. Flowers yellowish-white. Carpels conspicuously feathered.

Sepals 4; petals many, minute. Atragene.

4. C. verticillaris De Cand.: leaves whorled in fours, ternate; leafets petioled, cordate, nearly entire; peduncles 1-flowered; petals acute.—Atragene americana. Sims. Pursh.

Hab. Rocks. N. Y. Penn. N. to lat. 54°. June. 5.—Stem climbing. Flowers very large, purple.

2. THALICTRUM. Linn.

Involucre under the flower none. Petals none. Carpels dry, not awned, sometimes stipitate, sometimes with a longitudinal furrow. Polyandria. Polygynia.

* Stamens longer than the Calyx.

1. T. cornuti Hook.: leaves decompound; leafets roundish-obovate or oblong, 3-lobed, glaucous beneath, with the nerves scareely prominent; flowers mostly diœcious; filaments sub-clavate; anthers elliptie or sub-linear; stigmas filiform, membranaeeous on the margin; carpels ovate-oblong.—T. cornuti and T. pubescens Pursh.—T. revolutum Ell.

- Hab. Wet grounds. From lat. 56° N. to Car. June, July. 24.—
 Stem 3—4 feet high, branching. Leaves extremely variable in form, deep green above, paler glaucous smooth or pubescent beneath. Flowers in a compound leafy panicle, greenish.—I have quoted the above characters from Dr. Hooker, (Fl. Bor. Amer.) who though doubtful whether this is the T. cornuit of Linneus, considers it the plant described under that name by Pursh. And he has retained this as a specific name, in preference to reducing it to a doubtful synonym as De Candolle has done. T. pubescens of Pursh only differs from the present plant in the shape of the anthers.
- 2. T. dioieum Linn.: very smooth; leaves decompound; leafets roundish, cordate, obtusely lobed, glabrous; flowers diœcious, panicled; filaments filiform; fruit ovate, striate.—T. lævigatum Mich.

Hab. Banks of streams. Can. to Car. and N. to lat. 67°. April. 21.—Stem 1—2 feet high. Flowers white, in a terminal panicle.

3. T. rugosum Linn.: leaves decompound; leafets ovate-lanceolate, rugose, veined, obtusely lobed; flowers diœcious, in panicles; filaments filiform.

Hab. Swamps. Penn. to Car. June—Aug. 21.—Stem 3—5 feet high. Flowers white.

4. T. purpurascens Linn.: leaves compound, shorter than the stem; leafets roundish, 3-cleft, and incised, glaucous beneath; panicles nearly leafless, contracted; flowers monœcious or diœcious, cernuous; filaments coloured.

Hab. Dry hills. Can. to Virg. May, June. 21.—Plant smalls Stamens and filaments purple. This is perhaps only T. dioicum with purple flowers.

- ** Stamens shorter than the petaloid calyx.
- 5. T. anemonoides Mich.: root tuberous; radical leaves biternate; leafets subcordate, 3-toothed; floral leaves petioled, resembling an involucre; flowers perfect, few, umbelled; petaloid calyx 8—10 leaved.—
 Anemone thalictroides Linn.
 - Hab. Woods. Common throughout the U. S. April, May. 21.—Stem 6—8 inches high. Flowers white. The flowers of this species resembles those of Anemone, but the fruit that of Thalictrum. It is retained in this place by De Candolle and Hooker.

3. ANEMONE. Linn.

Involucre remote from the flower, of 3 divided leaves. Calyx petaloid, with 5—15 sepals. Petals none.

Polyandria. Polygynia.

1. A. nemorosa, var. quinquefolia De Cand.: leaves ternate; segments 5-parted, incisely dentate, lanceolate, acute; involucre similar, petioled; stem 1-flowered; sepals 6, elliptic; capsules awnless.—A. quinquefolia Linn.

- Hab. Woods. Can. to Car. N. to lat. 53°, extending westward to the Rocky mountains. April, May. 24.—Stem 6—8 inches high. Flowers white varying to purple. Leaves narrow and more divided than in the European plant. Wood Anemone.
- 2. A. lancifolia Pursh: leaves petioled, ternate; leafets lanceolate, crenate, dentate; sepals 5, ovate, acute; fruit ovate; style short, uncinate.
 - Hab. High mountains. Penn. and Virg. May, July. 24.—Resembles the foregoing species, but the flowers are larger and clear white. Pursh.—De Candolle who has examined Pursh's plant in the herbarium of Lambert, thinks it scarcely distinct from the Linnæan A. trifolia, while Dr. Hooker refers it with a mark of doubt to A. nemorosa.
- 3. A. pennsylvanica Linn.: leaves 3-parted; segments 3-cleft; lobes oblong, incisely toothed, acuminate; involucre similar, sessile, bearing several pedicels, one naked and 1-flowered, the others involucellate; sepals 5, elliptic; fruit pubescent, compressed, crowned with a long style.—A. aconitifolia Mich.

Hab. Meadows. Throughout the U. S. N. to Hudson's Bay. June, July. 21.—Stem a foot high. Flowers white, large. By some botanists A. dichotoma of Linneus, is considered distinct from the above, but it is most probably identical with it.

4. A. virginiana Linn.: leaves ternate; segments ovate-lanceolate, 3-cleft, acuminate, incisely toothed; involucre similar, petiolate; sepals 5, elliptic, acuminate, silky without; peduncles elongated; fruit oblong, woolly.

HAB. Woods. Throughout the U. S. and Can. as far N. as lat. 55°. July. 21.—Stem 18—20 inches high. Flowers small, greenish. Peduncles elongated.

4. HEPATICA, Willd.

Involucre 3-leaved, 1-flowered, resembling a calyx, entire. Sepals petaloid, 6-9, arranged in 2 or 3 rows. Ovaries many. Carpels without an awn. Polyandria. Polygynia.

H. triloba Willd.: leaves cordate, 3-lobed; lobes entire; scape and petioles hairy.—Anemone Hepatica Linn.

- a. lobes of the leaves somewhat acute. H. triloba De Cand.
- b. segments of the leaves acute. H. acutiloba De Cand.
- d. lobes of the leaves obtuse .- H. americana De Cand.
- Hab. In woods. Common throughout the U. S. and N. to lat. 52°. April, May. 21.—There appears to be no doubt that these supposed distinct species are nothing more than varieties. They grow indiscriminately, and the lobes of the leaves assume almost every variety of form.

 Liverwort.—Early Anemonc.

5. HYDRASTIS. Linn.

Sepals 3, ovate. Petals none. Stamens and ovaries numerous. Carpels berry-like, numerous, aggregated in a head, terminated by the style, 1-celled, 2-seeded.

Polyandria. Polygynia.

H. canadensis Linn.

Hab. Rocks woods. Can. to Car. W. to Miss. Rare. May. 21.—Stem 6—8 inches high, with 2 nearly opposite leaves above. Leaves petiolate, emarginate at base, incisely serrate. Flower solitary, pedunculate, reddish white. Fruit fleshy, red, like that of a Rubus. The root affords a juice of a fine yellow colour, which is used by the Indians for staining skins and clothing.

Yellow Puccon.

6. RANUNCULUS. Linn.

Sepals 5, not deciduous. Petals 5, rarely 10, with a honey scale at the base on the inside. Stamens and ovaries numerous. Carpels ovate, somewhat compressed, terminating in a point or horn, smooth, striated, or tuberculated, arranged in a globose or cylindric head. Polygandria. Polygynia.

* Carpels transversely rugose-striate. Petals white.

1. R. aquatilis, var. capillaeeus De Cand.: stem filiform, floating; leaves all submersed, divided into capillary diverging segments; petals obovate, longer than the calyx.—R. fluviatilis Wild. Pursh.

Hab. In streams. Throughout the U. S. and British America. N. to lat. 68°. July, Aug. 21.—Stem long. Leaves petioled. Flowers small, white. There are several varieties of R. aquatilis, which have been described as distinct species.

Water Crowfoot.

** Curpels smooth, ovate, collected into a roundish head. Flowers yellow.

† Leaves undivided.

2. R. lingua Linn.: leaves lanceolate, subserrate, semiamplexicaul; stem erect, smooth, succulent, many-flowered.

Hab. Banks of streams. N. S. July, Aug. 24.—Stem 2—3 feet high, with erect branches. Leaves very long, linear-lanceolate. Flowers large. Great Spearwort.

3. R. flammula Linn.: leaves glabrous, linear-lanceolate or sub-ovate, subentire, the lower ones petiolate; stem more or less decumbent, rooting; peduncles opposite to the leaves.—R. flammula, var. major Hook,

HAB. Swamps. Can. to. Virg. July, Sept. 24.—Stem 12—18 inches high, succulent. Flowers smaller than in the former.—Said to be a powerful and speedy emetic. Small Spearwort.

4. R. reptans Linn.: leaves linear, entire, remote, smooth; stem filiform, creeping, jointed; joints 1-flowered.—R. filiformis Mich.—R. reptans, var. filiformis De Cand. Torr.—R. flammula, var. filiformis Hook.

Hab. River banks. N. S. and N. to Labrador. July, Aug. 21.—A very delicate species.—Stem 6—12 inches long. Flowers small. Fruit very smooth. Although coming from such high authority, I cannot yet adopt the opinion of Dr. Hooker that this plant is a mere variety of R. flammula. From a comparison of specimens, I am satisfied that our plant is identical with the foreign R. reptans.

5. R. pusillus Pursh: leaves petioled; lower ones ovate, subdentate; upper ones linear-lanceolate; stems many, erect; pedicels opposite to

the leaves, solitary, 1-flowered.

Hab. Wet grounds. N. J. to S. Car. June—Aug. 21.—Stems 6—12 inches high, weak. Flowers small, pale-yellow.—Distinguished from R. flammula by its smaller size, and by its lower leaves being ovate.

6. R. cymbalaria Pursh: stems sarmentose filiform; leaves petiolate, smooth, somewhat fleshy, cordate, reniform or ovate, coarsely crenate; scapes naked, elongated, 3-flowered; petals linear, as long as the calyx; carpels striate.—R. cymbalaria, var. americanus De Cand.

Hab. Salt marshes. N. Y. Mass. Can. to lat. 68° N. and from Hudson's Bay to the summits of the Rocky mountains. July, Aug. 21.—Scapes 2—6 inches high. Flowers small. Fruit oblong. Its runners are very properly compared by Dr. Smith. to those of the garden strawberry.

Sea Crowfoot.

tt Leares divided.

7. R. auricomus Linn.: leaves smooth; radical ones petioled, cordate, mostly 3-parted or lobed; cauline ones sessile, divided into linear, entire or subdentate lobes; calyx pubescent, shorter than the petals, spreading.

Hab. Woods and meadows. Penn. Pursh. May, June. 21.— Stem a foot or more high. Flowers middle sized. Pursh, I believe,

is the only authority for this as an American species.

Wood Crowfoot.

8. R. abortivus Linn.: leaves smooth; radical ones petiolate, cordate-orbiculate, crenate, sometimes 3-parted; stem leaves ternate and 3-5 cleft, with linear segments; upper ones sessile; calyx a little

longer than the petals, reflexed.

Hab. Wet grounds. Throughout the U.S. and Can. July, Aug. 21.—Stem a foot high. Leaves very variously dissected, mostly smooth, sometimes pubescent. Flowers small, yellow, the petals being sometimes twice as long as the calyx. Carpels compressed, forming an ovate or nearly globose head. R. nitidus of Walter, is a variety of this species, differing only in size, being nearly twice as large.

9. R. secleratus Linn.: leaves smooth; radical ones petioled, 3-parted, the segments lobed; cauline ones 3-lobed, lobes oblong, linear, entire; calyx smooth; carpels small, numerous, forming an oblong head.

Hab. Wet grounds. From lat. 67° N. to S. Car. May—Aug. 21.—Stem a foot high, branched, succulent. Flowers small. The plant is almost entirely glabrous. Celery leaved Crowfoot.

- 10. R. lacustris Beck and Tracy: stem elongated; emersed leaves reniform, 3—many parted; submersed ones cleft into numerous capillary segments; petals 5—8, obovate, twice as long as the sepals; nectary concave; fruit subglobose.—R. multifidus Pursh.—R. Purshii Hook.
 - Hab. Stagnant waters. N. S. N. to near the Arctic Sea. W. to the Rocky mountains. May, June. 21.—Stem 3—4 feet long. Flowers large, shining, bright yellow. When the plant grows in water the leaves are divided into capillary segments, but when found on muddy banks they are often rounded or reniform, and divided into only 3—5 blunt segments. Hence the reason why this plant has been made the basis of several distinct species. I should observe that the more common state of it was for a long time mistaken by our botanists for R. fluviatilis; as was first shown by Mr. James G. Tracy and myself, in 1822. (N. V. Med. & Phys. Jour.) The name R. multiflus, applied to it by Pursh, had previously been appropriated by Sir J. E. Smith to a totally distinct species from Egypt. De Candolle gives a new name to the Egyptian plant, retaining Pursh's name for the present one; while Dr. Hooker unites several supposed distinct species under the name of R. Purshii. On the whole I have thought best to retain the name imposed by us: though an attentive examination has satisfied me that the plant is much more variable than I had formerly supposed.
- 11. R. acris Linn.: leaves mostly pubescent, 3-parted; lobes incisely toothed, acute; upper ones linear; stem erect, many-flowered, subpubescent; peduncles terete, not furrowed; calyx spreading, sub-villose; carpels terminated by nearly a straight point.
 - Hab. Meadows. N. S. May—Aug. 4.—Stem varying much in height, mostly hairy. Flowers bright yellow, shining. A specimen in the herbarium of Dr. T. R. Beck, labelled by Muhlenberg R. saniculaformis, is identical with the present species.

 Meadow Crowfoot.
- 12. R. repens Linn.: leaves ternate; leafets wedgeform, 3-lobed, incisely dentate; central one petiolate; main stems prostrate; flowering ones erect; peduncles furrowed; calyx pilose, spreading; carpels with a straight point.
 - HAB. Wet meadows. Can. to Car. June—Sept. 21.—Plant increasing by runners. Flowering stems erect, 1—2 feet high. Flowers middle sized. I am disposed to unite with this species R. nitidus of Muhlenberg and Hooker.
- 13. R. clintonii Beck: somewhat hairy; stems creeping and rooting at each of the joints; lower leaves on long petioles, ternate; leafets toothed and incised, cuneate, terminal one petioled; floral leaves incised or linear; peduncle 1—3 flowered; petals rounded; calyx spreading; carpels margined, with a short uncinate style.—R. prostratus Eat.
 - Hab. Banks of the canal near Rome, Oneida co. N. Y. June, July. 21.—Much smaller than R. repens, at least of American botanists, in all its parts except the flower, which is of a bright yellow and about as large as that of R. acris. Leaves seldom

more than 1 1-2 inches in length, and about the same in breadth. Stems distinctly creeping like that of R. reptans; flowering ones 6-8 inches high. Style short and hooked. Whole plant somewhat hairy. I have named this species, which I must believe to be quite distinct, in token of my friendship for G. W. Clinton, Esq. It is undoubtedly the same plant which is described by Prof. Eaton in his Manual of Botany, (5th ed.) under the name of R. prostratus of Lamarck. But that species, if indeed it exists, is a very obscure one, and has heretofore been found only in the neighborhood of Paris. De Candolle does not mention it in his Prodromus, and Sprengel places it as a synonym under R. repens. Syst. Veg. ii 556. The only description of it that I have met with is in the elaborate article Ranunculus, in Rees' Cyclopædia, from the pen of the late Sir James Edward Smith.

14. R. hispidus Mich.: erect, branched; stem and peticles with stiff spreading hairs; leaves ternate or 3-parted; leafets or segments acutely lobed; pubescence of the pedicels appressed; calyx hairy, at length reflexed; carpels in a globose head, margined, compressed, smooth; style very short and straight.

HAB. Wet grounds. Can. to Car. N. to lat. 670 and from Hudson's Bay to the Pacific. June—Aug. 21.—Stem 18 inches high, very hairy; Lower leaves on long petioles; upper ones nearly sessile; leafets nearly all petioled, 3-cleft or 3-parted, at-

tenuate at base. Flowers about the size of R. acris.

Hairy Crowfoot.

15. R. pennsylvanicus Linn.: stem erect and with the petioles covered with stiff spreading hairs; leaves ternate, villous; segments subpetiolate, acutely 3-lobed, incisely serrate; calyx reflexed; carpels with a short straight style, collected in an oblong head.

HAB. Wet meadows. From the Arctic regions to Geor. July, Aug. 24.—Stem 18 inches high. Flowers large. Distinguished from R. hispidus, to which it is most nearly allied, by its ob-

long head of fruit, and by its still shorter style.

16. R. recurratus Pursh: stem erect and with the petioles covered with spreading hairs; leaves 3-parted, hairy; segments oval, subincised; the lateral ones 2-lobed; calyx reflexed; petals lanceolate; carpels uncinate.

HAB. Shady woods. Throughout the U. S. and from Labrador to the Columbia river. June—Aug. high. Flowers small, pale yellow. 24.-Stem 12-15 inches

17. R. faseicularis Muhl.: stem erect, branched; leaves on long petioles, pubescent, ternate; the middle segment deeply 3-cleft; lateral remotely 3-lobed; calyx spreading, shorter than the petals, villous; nectary flat, wedgeform; pericarps rounded, compressed, collected into a globose head.

Woods. N. S. and Can. W. to Miss. April, May. -Root fascicled. Flowers large. Varies considerably in the form of its leaves, which are however always much more compound than is usual in this genus.

18. R. marylandicus Poir.: stem erect, somewhat branched and with the petioles soft hairy; leaves smoothish, ternate; leafets 3-lobed; lobes oblong, acute, incisely toothed; calyx smooth, spreading, shorter than the petals; pericarps compressed, with a straight acuminate style.

HAB. Woods. Penn. to Virg. May-July. 21.-Flowers pale

yellow. Pursh.

19. R. bulbosus Linn.: hairy; radical leaves ternate, on long petioles; leafets petiolate, 3-cleft, the segments narrow, incisely toothed; stem erect, bulbous at the base; calyx reflexed, hairy; petals obcordate, shorter than the sepals.

Hab. Meadows. May—Aug. 21.—Stem 8—15 inches high. Flowers large, bright yellow. Medicinal. See Big. Med. Bot. iii. 61.

Buttereups.

*** Carpels aculeate or tuberculate.

20. R. hirsutus Curt.: leaves ternate or 3-lobed; lobes obtuse, incisely-toothed, middle one pedunculate; calyx reflexed; stem not bulbous at the base; carpels with a single row of small tubercles on their margins.—R. philonotis Pursh.

Hab. Wet fields. Conn. and Penn. June—Oct. 24.—This has probably been confounded with some other species; but it differs from all our northern ones, by its tuberculate carpels.

7. CALTHA. Linn.

Calyx coloured, with 5 roundish sepals resembling petals. Petals none. Stamens numerous. Capsules 5—10, compressed, spreading, 1-celled, many-sceded.

Polyandria. Polygynia.

1. C. palustris Linn.: stem succulent, erect; leaves cordate, suborbicular, obtusely crenate, petiolate; flowers large, pedunculate; sepals ovate.

HAB. In bogs. N. S. and Can. Labrador to the Columbia river. April, May. 21.—Stem a foot high, dichotomous. Leaves large and shining. Flowers peduncled, large yellow.

Marsh Marigold.

2. C. integerrima Pursh: stem erect, corymbose; leaves orbicular-cordate, very entire, with the sinus closed; floral ones sessile, reniform, obsolctely crenate at the base; sepals oval, obtuse.

HAB. Boggy meadows. N. S. May-July. 21.-Flowers co-

rymbose, smaller than No. 1. Sepals very obtuse.

3. C. parnassifolia Raf.: stem erect, 1-flowered, 1-leaved; radical leaves petiolate, lanceolate-cordate, obtuse, many-nerved; sepals elliptical.—C. ficaroides Pursh.—Ranunculus ficaria Walt.

Hab. Cedar swamps. N. J. to Car. June, July. 21.—Flowers deep yellow, middle sized.

4. C. flabellifolia Pursh: stem procumbent, many-flowered; leaves dilated-reniform; lobes widely spreading, coarsely and acutely toothed; peduncles axillary, solitary, 1-flowered; sepals obovate; capsules uncinate.

Hab. Sand spring, on Pokono mountain. Penn. Pursh. July,
 Aug. 21.—Stem a foot high. Flowers yellow, middle sized.
 Allied to C. natuus found in Canada and in Siberia.

8. TROLLIUS. Linn.

Sepals coloured, 5—10—15, deciduous, petaloid. Petals 5—20, small. Capsules many, subcylindrical, sessile, many-seeded. Polyandria. Polygynia.

T. americanus Muhl.: leaves palmate; sepals 5—10, spreading; petals 5—10, shorter than the stamens.—T. laxus Pursh.

Hab. Wet grounds. Western part of N. Y. Penn. W. to the Rocky mountains. May—July. 21.—Stem a foot or more high. Flowers terminal, large, yellow. Probably often mistaken for a species of Ranunculus.

9. COPTIS. Salisb.

Sepals 5—6, coloured, petaloid, deciduous. Petals small, cucullate. Stamens 20—25. Capsules 6—10, on long stalks, membranous, 4—6 seeded. Polyandria. Polygynia.

C. trifolia Salisb.: leaves on long petioles, ternate; leafets obovate, obtuse, toothed or obscurely 3-lobed; scape 1-flowered.—Helleborus trifolius Linn.

HAB. Swamps. N. S. and Can. May—July. 21.—Scape 4—6 inches high. Flowers white. It affords a bitter infusion and a yellow dye.—See Big. Mcd. Bot. i. 60.—Raf. Mcd. Fl. i. 127.

Gold Thread.

10. AQUILEGIA. Linn.

Sepals 5, deciduous, petaloid. Petals 5, bilabiate above, drawn out into a spur at base. Capsules 5, distinct, many seeded, with acuminate styles. Polyandria. Pentagynia.

A. canadensis Linn.: spurs straight; styles and stamens exserted; sepals somewhat acute, a little longer than the petals; segments of the leaves 3-parted, rather obtuse, incisely toothed.

Hab. Rocks. Throughout the U. S. and Can. April, May. 21.—Stem 1—2 feet high, branched above. Leaves glaucous; radical ones biternate, the upper ones becoming gradually more simple. Flowers yellow and scarlet. Wild Columbine.

11. DELPHINIUM. Linn.

Calyx deciduous, petaloid, irregular, the upper sepal produced downward into a spur.

Petals 4; 2 upper ones horned
Polyandria. Di-Pentagynia.

* Capsules 3-5. Petals free. Perennial.

1. D. azurcum Mich.: petioles a little dilated at the base; leaves 3—5 parted, many-cleft, lobes linear; raceme erect; petals densely bearded at the apex; flowers on short pedicels.

Hab. Woods. Penn. to Car. W. to Miss. May. 21.—Stem 2 feet high. Flowers large, blue.

2. D. exaltatum Ait.: petioles not dilated at the base; leaves flat. 3—7 cleft beyond the middle; lobes wedgeform, 3-cleft at the apex, acuminate; lateral ones often 2-lobed; raceme erect; spur straight, as long as the calyx; capsules 3.—D. tridactylum Mich.

HAB. Woods. N. S. Torr. Car. Miss. May. 21.—Stem 2 feet

high. Flowers large, light blue.

** Capsule 1. Petals united. Annual.

3. D. consolida Linn.: stem erect, somewhat glabrous, divaricately branched; flowers few, in lax racemes; pedicels longer than the bracts; capsule smooth.

HAB. Near cultivated grounds. June. @.—Stem 2 feet high.

Flowers blue. Introduced.

Larkspur.

12. ACONITUM. Linn.

Calyx petaloid, irregular, deciduous, or marcescent; upper sepal concave, helmet-form. Petals (nectaries) 2, with long claws, (on peduncles) hooded, recurved. Capsules 3—5.

Polyandria. Di-Pentagynia.

A.uncinatum Linn.: panicle rather loose, with divergent branches; galea exactly conical; spur inclined, somewhat spiral; styles 3—5; leaves 3-lobed; lobes equal.

Hab. Mountains. Penn. to Car. Sept. 24.—Stem twining, branching. Leaves coriaceous, deeply 3-lobed. Flowers 3—4, near the summit of each branch, large, purple. De Candolle notices two American varieties of this species.

13. ACTÆA. Linn.

Calyx deciduous, 4 sepalled. Petals 4. Carpels many seeded. Polyandria. Di-Pentagynia.

* Carpels dry, dehiscent.

1. A. racemosa Linn.: leaves ternately decompound; leafets ovateoblong, dentate and incised; racemes panicled, very long; flowers with 1-style.—A. monogyna Walt.—Cimicifuga serpentaria Pursh.—C. racemosa Nutt. and Torr.—Macrotys serpentaria Raf. and Eat.

Hab. Woods. Can. to Flor. July, Aug. 21.—Stem 4—5 feet high. Racemes 6—10 inches long, somewhat panieled. Flowers nearly white. Has a very fetid smell. Medicinal. Bluck Snake-root.

** Carpel 1, not dehiscent.

2. A. rubra Willd.: leaves twice and thrice ternate; raceme hemispherical; petals shorter than the stamens, acute; pedicels of the fruit smaller than the peduncle; berries shining, red, many seeded.—A. spicata Mich.—A. brachypetala De Cand.—A. americana, var. rubra Pursh.

HAB. Woods. Can. to Car. May. 24.—Stem 2 feet high. Floreers white. Berries red and shining. Red Cohosh.

3. A. alba Big.: leaves twice and thrice ternate; raceme oblong; petals equal to the stamens; pedicels of the fruit as large as the peduncle; berries white, few-seeded.—A. spicata, var. alba Mich.—A. americana, var. alba Pursh.—A. pachypoda Ell.

Hab. Woods. Can. to Car. May. 21.—Pedicels shorter and thicker than in the preceding. Berries milk-white, tipt with

red, smaller than in A. rubra.

14. ZANTHORIZA. Linn.

Calyx deciduous, 5-sepalled. Petals 5. Capsule 2-3 seeded, by abortion 1-seeded. Pentandria. Polygynia.

Z. apiifolia L' Herit.

Hab. Banks of streams. Penn. to Geor. May. b.—Suffruticose.

Root large, yellow. Stem 2—3 feet high. Leaves bipinnate.

Flowers in panicles, dark purple. Yellow Root.

ORDER II. MAGNOLIACEÆ. De Cand. Lind.

Sepals 3—6, deciduous. Petals 3—27, hypogynous, in several rows. Stamens indefinite, distinct, hypogynous. Anthers adnate, long. Ovaries numerous, simple, arranged upon the torus above the stamens, 1-celled. Style short. Stigma simple. Fruit either dry or succulent, consisting of numerous carpels, which are arranged upon an elongated axis. Seeds solitary or several, attached to the inner edge of the carpels. Embryo minute, at the base of a fleshy albumen.

Trees or Shrubs. Leaves alternate, coriaceous. Flowers large, solitary, often odoriferous.

1. MAGNOLIA. Linn.

Sepals 5. Petals 6-9. Carpels 2-valved, 1-seeded, imbricated in a cone. Seeds pendulous, arillate.

Polyandria. Polygynia.

1. M. glauca Linn.: leaves perennial, elliptical, obtuse, petiolate, glaucous beneath; flowers 9—12 petalled; petals obovate, concave.

Hab. Swamps. N. J. to Car. May, June.—A shrub or small tree with whitish bark. Flowers solitary, terminal, white, odorous.

Sweet Bay.

2. M. acuminata Linn.: leaves deciduous, oval, acuminate, pubescent beneath; flowers 6-9 petalled; petals obovate, somewhat obtuse.

Hab. Mountains. Penn. to Car. June, July. A middle sized tree, sometimes, however, attaining the height of 70 feet. Floveers of a dull yellow colour, about the size of those of M. glauca.

Cucumber Tree.

3. M. tripetala Linn.: leaves deciduous, cuneate-lanceolate, acute, silky when young; petals 9, oval-lanceolate, acute, the outer ones reflected.—M. umbrella Lam.

HAB. Mountain woods. Penn. to Geor. June.—A small tree with irregular branches and very large leaves and flowers.

Umbrella Tree.

2. LIRIODENDRON. Linn.

Sepals 3. Petals 6. Carpels (Samara) imbricated in a cone, 1-2 seeded, not opening, attenuated.

Polyandria. Polygynia.

L. tulipifera Linn.

Hab. Woods. Throughout the U.S. July. One of the largest trees of our forest. Leaves alternate, 3-lobed; the middle lobe truncate. Flowers solitary, large, of a dull yellow colour. According to Dr. Darlington there are two varieties of this species, differing chiefly in the colour and texture of the wood; the one being yellow and the other white. The yellow is the most valuable, but both are employed extensively by cabinet makers. The bark is a valuable tonic, &c. See Big. & Bart. Med. Bot. Dr. P. K. Roger's Inaugural Thesis, Philad. 1802. Dr. Emmet has found its virtues to reside in a principle which he denominates liriodeudrine. See Jour. Phil. Coll. of Phar.

Tulin Tree. White Wood.

ORDER III. ANONACEÆ. De Cand. Lind.

Sepals 3—4, persistent, usually partly cohering. Petals 6, hypogynous, in two rows, coriaceous. Stamens indefinite, covering a large hypogynous torus, packed closely together, very rarely definite. Filaments short, more or less angular. Anthers adnate, turned outwards, with an enlarged 4-cornered connectivum. Ovaries mostly numerous. Styles short. Stigmas simple. Fruit consisting of a number of carpels. Seeds attached to the suture in one or two rows; embryo minute, in the base of a hard, fleshy albumen.

Trees or Shrubs. Leaves alternate, simple, almost always entire, without stipules. Flowers usually green or brown.

1. ASIMINA. De Cand.

Calyx 3-parted. Petals 6, spreading, ovate-oblong; inner ones smallest. Anthers many, subsessile. Berries usually 3, ovate or oblong, sessile. Seeds many.

Polyandria. Polygynia.

A. triloba De Cand.: leaves oblong, crenate, acuminate, and with the branches smoothish; flowers on short peduncles; outer petals roundish ovate, 4 times as long as the calyx.—Anona triloba Linn.—Orchidocarpum arictinum Mich.—Porcelia triloba Pursh.

Hab. Banks of streams. N. Y. to Flor. W. to Miss. April.—

HAB. Banks of streams. N. Y. to Flor. W. to Miss. April.—
A small tree 15 or 20 feet high. Flowers solitary, dark-brown.
Fruit large, fleshy, eatable, sweetish.

Papaw Tree.

ORDER IV. MENISPERMACEÆ. De Cand. Lind.

Flowers diclinous, usually diœcious and very small. Sepals and petals confounded in one or several rows, each of which is composed of 3 or 4 parts, hypogynous, deciduous. Stamens monodelphous or occasionally distinct, sometimes opposite the petals and equal to them in number, sometimes 3 or 4 times as many. Anthers adnate. Ovaries sometimes numerous, each with one style, cohering slightly at base, sometimes completely soldered together into a many celled body. Drupes mostly berried, 1-seeded, compressed. Seed same shape as the fruit; embryo curved; albumen wanting or small; cotyledons flat.

Shrubs, with a flexible tough tissue and sarmentaceous habit. Leaves alternate. Flowers small, usually racemose.

1. MENISPERMUM. Linn.

Sepals and petals arranged in fours, 2 or 3 rowed. Ster-ILE Fl. Stamens 16—20. Fertile Fl. Ovaries 2—4. Drupe berried, roundish-reniform, 1-seeded.

Dioecia. Monadelphia.

M. Canadense Linn.: leaves peltate, somewhat glabrous, cordate, obtusely angled, mucronate; racemes solitary, compound; petals 8.

Hab. Banks of streams. Can. to Car. July. D.—Varies somewhat in the angles of the leaves. Stem climbing. Flowers greenish yellow. Berries black, resembling grapes.

Moon-Seed.

ORDER V. BERBERIDE Æ. De Cand. Lind.

Sepals 3-4-6, deciduous, in a double row, surrounded externally by petaloid scales. Petals hypogynous, either equal to the sepals in number and opposite to them, or twice as many, generally with an appendage at the base in the inside. Stamens equal in number to the petals, and opposite to them; anthers generally with two separated cells, opening elastically with a valve from the bottom to the top. Ovary solitary, 1-celled; style rather lateral; stigma orbicular. Fruit a berry or capsule. Seeds 1, 2 or 3, attached to the bottom of the cell on one side; cotyledons flat.

Shrubs or herbs. Leaves alternate, compound, without stipules.

1. BERBERIS, Linn.

Sepals 6. Petals 6, with 2 glands upon their claws. Stamens without teeth, or with 2—3 teeth. Berry 2—3 seeded. Seeds 2, rarely 3, inserted laterally at the base of the cell.

Hexandria. Monogynia.

B. rulgaris Linn.: spines 3-parted; leaves simple, obovate, attenuate at base, ciliate-serrate; racemes many flowered, pendulous; petals entire.—B. canadensis Pursh. Nutt.

HAB. Rocky hills. Throughout the U. S. and Can. April, May.
 In the sum of the sum of

2. LEONTICE. Linn.

Sepals 6, naked without. Petals 6, bearing a scale at the base. Capsule 2—4 seeded. Seeds globose, inserted into the bottom of the capsule. Hexandria. Monogynia.

L. thalictroides Linn.: cauline leaf solitary, bi-tritenate; leafets 2—3 lobed; flowers paniculate from the centre of the leaves.—Caulophyllum thalictroides Mich.

Hab. Rocky woods. Throughout the U.S. and Can. April, May. 21.—Stem a foot high. Flowers small, greenish-yellow. Berries deep blue, globose, contracted below into a long stipitate base. Whole plant turns almost black in drying. Cohosh.

ORDER VI. PODOPHYLLEÆ. Lind.

Sepals 3-4, deciduous or persistent. Petals in two, three or more rows, each of which is equal in number to the sepals.

Stamens hypogynous, 12—18, arranged in two, three or more rows; anthers linear, oval, turned inwards. Stigma somewhat peltate. Fruit succulent or capsular, 1-celled. Seeds indefinite; embryo small.

Herbs. Leaves broad lobed. Flowers radicals, solitary, white.

1. PODOPHYLLUM. Linn.

Sepals 3. Petals 6—9. Stamens 12—18. Stigma large, subsessile, peltate. Berry somewhat fleshy, not dehiscent. Seeds many. Polyandria. Monogynia.

P. peltatum Linn.: stem erect, 2-leaved, 1-flowered; fruit ovate.
HAB. Woods. Throughout the U. S. and Can. May. 21.—
Stem a foot high, 2-leaved, 1-flowered. Leaves large, peltate, lobed. Flowers solitary, white, pendulous. Fruit large, ovate, crowned with the persistent stigma. Known under the name of May-apple. Its root is often used as a substitute for jalap. See Big. & Bart. Med. Bot. and Schneck's Exper. Inq. &c. N. Y. Med. & Phys. Jour. ii. 30.

2. JEFFERSONIA. Bart.

Sepals 4. Petals S. Capsule obovate, semicircularly dehiscent. Seeds many, arillate at base.

Octandria. Monogynia.

J. diphylla Pers.: - J. bartonis Mich.

Hab. N. Y. Penn. Virg. and Tenn. May. 21.—Scape a foot high. Leaf binnate, petioled. Flower terminal, solitary, large, white, resembling that of Sanguinaria. Capsule large, coriaceous. Seeds shining, oblong.

ORDER VII. HYDROPELTIDEÆ. Lind.

Sepals 3 or 4, coloured inside. Petals 3 or 4, alternate with the sepals. Stamens definite or indefinite, hypogynous, arising from an obscure torus; anthers linear, turned inwards, continuous with the filament. Ovaries 2 or more. Fruit indehiscent, tipped by the indurated style. Seeds definite, pendulous; embryo seated at the base of a fleshy albumen.

Aquatics, with floating leaves. Flowers axillary, solitary, yellow or purple.

1. HYDROPELTIS. Mich.

Calyx of 3-4 sepals. Petals 3-4. Stamens 18-36. Ovaries 6-18. Seeds pendulous, ovate-globose. Polyandria. Polygunia.

H. purpurca Mich.—Brasenia peltata Pursh.—B. hydropeltis Torr.
 Hab. Lakes and ponds. Can. to Geor. July, Aug. 21.—
 Whole plant covered with a viscid gelatine. Stem floating, long, terete, branched. Leaves oval, peltate, coriaceous, very entire and tinged with purple. Peduncles solitary, long, each springing from the side of a petiole. Flowers purple.

Water-Target.

2. FLŒRKIA, Willd.

Calyx of 3 sepals. Petals 3, shorter than the sepals. Style bifid. Pericarp none. Seeds 2 or 3, membraceously coated, superior. Hexandria. Monogynia.

F. uliginosa Muhl. - F. palustris Nutt. - Neetris pinnata Pursh.

HAB. Marshes. Ver. to Virg. April, May. —Stem decumbent, terete, slender, smooth. Leaves somewhat succulent, alternate, trifid and pinnatifid, with along petiole. Peduncles axillary, gradually lengthening. Flowers small, white. Dr. Torrey, in his valuable catalogue of North American plants, appended to the American edition of Lindley's Introduction to the Natural System of Botany, places this genus with a mark of doubt, under the present order. I have followed his suggestion, although it is by no means certain that this is its true place. Further examination may prove that it belongs to some other order, or what is more probable, that it should be the type of a new one. False Mermaid:

ORDER VIII. NYMPHÆACEÆ. De Cand.

Sepals and petals numerous, imbricated, passing gradually into each other. Stamens numerous, sometimes forming with the combined petals, a superior monopetalous corol; filaments petaloid; anthers turned inwards, adnate. Fruit many-celled, indehiscent. Seeds very numerous. Embryo small, on the outside of the base of the albumen.

Herbs, with peltate or cordate fleshy leaves arising from a prostrate trunk, growing in quiet waters.

1. NELUMBIUM. Juss.

Calyx petaloid, of 4—6 sepals. Petals numerous. Carpels numerous, deeply immersed in the upper surface of a turbinate receptacle or torus, 1-seeded. Seed large, round, solitary. Polyandria. Polygynia.

N. luteum Willd.: corol, many petalled; anthers produced into a linear appendage at the extremity; leaves peltate, orbicular, very entire.—Cyamus flavicomus Salisb. Pursh.—C. luteus Nutt.

HAB, Lakes. N. Y. to S. Car. W. to Miss. July. 21.—Leaves alternate, peltate. Peduncles very long, more or less scabrous.

Flowers yellowish-white and larger than that produced by any other plant in North America, except Magnolia macrophylla.

Water Chinquepin.

2. NYMPHÆA. Linn.

Sepals at the base of the disk. Petals and stamens connected with the whole of the disk, which covers the carpels.

Polyandria. Monogynia.

N. odorata Ait.: leaves floating, orbicular-cordate, very entire; nerves and veins prominent; calyx 4-leaved, equal to the petals; stigma 16—20 rayed; rays erect, inflexed at the apex.—N. alba Walt. Mich.

Hab. Ponds. Can. to Car. June, July. 21.—Leares on very long petioles. Flowers large, white, odorous. N. minor of De Candolle is probably only a variety of this species. Pond Lily.

3. NUPHAR. Smith.

Sepals, petals and stamens inserted at the base of the disk.

Polyandria. Monogynia.

1. N. lutea Smith: calyx with 5 sepals; stigma entire, 16—20 rayed, deeply umbilicate; leaves cordate, oval, lobes approximate; petioles 3-sided, acute-angled.—Nymphaa lutea Linn.

HAB. In water. N. S. and N. to lat. 64°. June. 21.—Sepals very obtuse. Petals much smaller, truncate. Confounded by some of our botanists with the next species, from which it is quite distinct.

2. N. advena Ait.: calyx 6-leaved; petals numerous, small; leaves cordate, with divaricate lobes; petioles semicylindrical; fruit sulcate.

—Nymphaa advena Mich.

HAB. In water. Can. to Car. June, July. 21.—Leaves upright or floating. Flowers large, yellow. Yellow Water Lily.

3. N. kalmiana Ait.: calyx 5-leaved; stigmas incised, 8—12 rayed; leaves cordate, submersed, with approximate lobes; petioles terete.—Nymphaa lutea, var. kalmiana Mich.

HAB. In water. N. S. and Can. July, Aug. 21.—Leaves and flowers small.

Kalm's Water Lity.

ORDER IX. PAPAVERACEÆ. De Cand. Lind.

Sepals 2, deciduous. Petals hypogynous, either 4, or some multiple of that number placed in a cruciate manner. Stamens either 8, or some multiple of 4, generally very numerous. Ovary 1. Style short or none. Stigmas 2 or many. Fruit 1-celled, either pod-shaped, with 2 parietal placentæ, or capsular, with several placentæ. Seeds numerous. Embryo minute, in the base of a fleshy albumen.

Herbs or shrubs, with a milky juice. Leaves alternate, more or less divided. Peduncles long, 1-flowered.

1. ARGEMONE. Linn.

Petals 4—6. Stamens many. Style scarcely any. Stigmas 4—7, radiating, concave, free. Capsule obovate, 1-celled; valves dehiscent at the apex. Seeds spherical.

Polyandria. Monogynia.

A. mexicana Linn.

2. SANGUINARIA. Linn.

Sepals 2, deciduous. Petals 8-12. Stamens 24. Stigmas 2. Capsule oblong, 2-valved, ventricose; valves deciduous. Polyandria. Monogynia.

S. canadensis Linn.

Hab. Woods. Throughout the U. S. and Can. April, May. 21.—Root tuberous, affording a bitter orange coloured juice, which contains a vegeto-alkaline principle. Leaves radical, reniform or cordate. Flowers large, white, solitary. Medicinal Emetic, &c. Big. Med. Bot. i. 75. Tully on Sanguinariu. Am. Med. Recorder, vol. xiii.

Blood Root.

3. MECONOPSIS. De Cand.

Petals 4. Stamens many. Style short. Stigmas 4—6, radiating, convex, free. Capsule obovate, 1-celled; valves 4—6, dehiscent at the apex. Polyandria. Monogynia.

M. diphylla De Cand.: leaves 2, sessile, hairy; lobes rounded and obtuse; capsules 4-valved, echinate.—Chelidonium diphyllum Mich. Pursh.—Stylophorum diphyllum Nutt.

HAB. Woods. Penn. to Ill. May. 21.—Stem a foot high. Leaves glaucous. Flowers yellow. Abundant in Indiana.

4. CHELIDONIUM. Linn.

Sepals 2, glabrous. Petals 4. Stamens many. Capsule elongated, 2-valved, 1-celled; valves dehiscent from the base to the apex. Seeds several, furnished with a glandular crest. Polyandria. Monogynia.

C. majus Linn.: leaves pinnate, glaucous; leafets roundish, dentate-lobed; umbels axillary, pedunculate; petals elliptic, entire-

HAB. Fields. N. S. May-Oct. 21.—Stem 12—18 inches high. Flowers yellow. Plant full of an orange juice. Probably introduced. Celadine.

ORDER. X. SARRACENIEÆ. Hook. Lind.

Sepals 5, persistent, often having a 3-leaved involucre on the outside; astivation imbricate. Petals 5, hypogynous; unguiculate, concave. Stamens indefinite, hypogynous; anthers oblong, adnate, 2-celled, bursting internally and longitudinally. Ovary superior, 5-celled; style single; stigma much dilated, peltate, with 5 angles. Capsule crowned by the persistent stigma, with 5 cells and 5 loculicidal valves. Seeds very numerous, minute, slightly warted, covering 5 large placentæ, which project from the axis into the cavity of the cells; albumen abundant; embryo cylindrical, lying near the base of the seed, with the radicle turned to the hilum.

Herbs found in bogs. Roots fibrous. Leaves radical with a hollow urn-shaped petiole, at the apex of which is articulated the lamina, which covers the petiole like a lid. Scapes having each one large flower.

1. SARRACENIA. Linn.

Sepals 5, with a 3-leaved involucre. Petals 5. Capsule 5-celled. Style with a clypeate stigma.

Polyandria. Monogynia.

S. purpurea Linn.: leaves much shorter than the scape, inflated, contracted at the mouth, having a broad arched lateral wing; appendix erect, broad-cordate, undulate, not mucronate.

HAB. Sphagnous swamps. Can. to Car. June, July. 21.—Scape 1—2 feet high, with a solitary terminal purple flower.

Side-saddle Flower.

ORDER XI. FUMARIACE E. De Cand. Lind.

Sepals 2, deciduous. Petals 4, cruciate, parallel; the two outer, either one or both, saccate at the base; the 2 inner callous and coloured at the apex, where they cohere and enclose the anthers and stigma. Stamens 6, in two parcels opposite the outer petals, very seldom all separate; anthers membranous. Ovary superior, 1-celled; style filiform; stigma with two or more points. Fruit either an indehiscent 1 or 2 seed-

ed nut, or a 2-valved many seeded pod. Seeds horizontal.

Albumen fleshy. Embryo minute.

Herbs with brittle stems and a watery juice. Leaves usually alternate, many-cleft, often with tendrils. Flowers purple, white or yellow.

1. FUMARIA. Linn.

Calyx of 2 sepals. Petals 4, one gibbous or spurred at the base. Pouch ovate or globose, 1-seeded, indehiscent, not pointed with a style.

Diadelphia. Herandria.

F. officinalis Linn.: stem subcrect; leaves bipinnate and cleft, with linear segments; racemes rather loose; fruit-bearing pedicels erect, twice as long as the bracts; pouch globose, smooth, somewhat retuse.

Hab. Sandy fields. N. S. July, Aug. O.—Stem a foot high. Flowers rose-coloured. Introduced. Fumitory.

2. DICLYTRA. De Cand.

Petals 4, 2 outer ones equally spurred or gibbous at base.

Pod 2-valved, many-seeded.

Diadelphia. Hexandria.

1. D. cucullaria De Cand.: scape naked; raceme simple, 1-sided; spurs straight, divaricate, acute; leaves 2, decompound.—Fumaria cucullaria Linn.—Corydalis cucullaria Pers.

HAB. Shady hills. Throughout Can. and N. S. W. to Miss. May. 21.—Root bulbous. Scape 6—8 inches high. Flowers large, yellowish-white. The spurs are frequently much divaricated.

Dutchman's Breeches.

2. D. formosa De Cand.: scape naked; raceme somewhat compound, many-flowered, nodding; segments of the leaves oblong, incisely-pinnatifid; spurs slightly curved, obtuse; stigmas 2-angled.—Corydalis formosa Pursh.

HAB. Hills. Can. and N. S. May. 21.-Root bulbous. Flow-

ers rose-coloured.

3. D. eximia De Cand.: scape naked, simple, few-flowered; leaves bipinnate; segments linear, glaucous beneath; spurs 2, short, obtuse; stigma 4-angled.—D. formosa Ell.?—D. Canadensis De Cand.—Corydalis canadensis Goldie.

HAB. Can. to Car. May. 21.—Scape 6—8 inches high. Flowers purplish-red, 4—6 in a raceme. Closely allied to D. formosa, but may be distinguished by its stigma. The root also is tube-

rous and not bulbous.

3. CORYDALIS. De Cand.

Petals 4, one spurred at base. Pod 2-valved, compressed, Diadelphia. Hexandria.

1. C. glauca Pursh: stem erect, branched; leaves glaucous, decompound; segments cuneate, trifid; bracts oblong-acute, shorter than the pedicels; pod linear, flat, scarcely torulose.—Fumaria glauca Curtis.

Hab. N. S. and Can. N. to 64°. May—July. @.—Stem 12—15 inches high. Flowers variegated with red, yellow and

green.

2. C. aurea Willd.: stem branched, diffuse; leaves glaucous, doubly pinnate, lobes oblong-linear; bracts linear-lanceolate, acuminate, toothed, longer than the pedicels; pod terete, torulose.—Fumaria aurea Muhl.

HAB. Shady rocks. Throughout Can. and N. to lat. 64°. W. to Rocky mountains, and S. to S. Car. June. ②.—Stem 8—12 inches high, branching. Racemes opposite the leaves. Flowers small, bright yellow.

4. ADLUMIA. Raf.

Petals 4, united in a spongy monopetalous corol, persistent, and with two protuberances at base. Pod 2-valved, many-seeded.

Diadelphia. Hexandria.

A. cirrhosa Raf.:—Corydalis fungosa Pcrs.—Funaria fungosa Willd.
—F. recta Mich.

 $\begin{array}{lll} \text{H}_{AB}, & \text{Woods.} & \text{Can. to Penn.} & \text{Catskill mountains.} & \text{July.} & \mathcal{S}. \\ & -Stems \text{ climbing.} & \textit{Leaves} \text{ decompound, furnished with tendrils.} \\ & Flowers \text{ numerous, in axillary racemes, pale red.} \end{array}$

ORDER XII. CRUCIFERÆ. De Cand. Lind.

Sepals 4, deciduous, cruciate. Petals 4, cruciate, alternate with the sepals. Stamens 6, of which two are shorter, solitary and opposite the lateral sepals, and four longer, in pairs, opposite the anterior, and posterior sepals. Disk with various green glands between the petals and the stamens and ovary. Ovary superior, 1-celled. Stigmas 2. Fruit a silicule or silique (pouch or pod,) rarely 1-celled and valveless, generally 2-celled and 2-valved, 1 or many-seeded, indehiscent or opening by the two valves. Seeds attached in a single row by a cord to each of the placentæ, generally pendulous. Albumen none. Embryo with the radical folded upon the cotyledons.

Herbs. Leaves alternate. Flowers usually yellow or white,

rarely purple.

DIV. I. SILICULOSÆ.

1. CAKILE. Linn.

Pouch 2-jointed, compressed; the upper joint ensiform or ovate. Seed solitary in the cells; upper erect, lower pendulous. Tetradynamia. Siliculosa.

C. americana Nutt.: leaves fleshy, oblong, obtuse, with the margins toothed; joints of the pouch 1-seeded; the uppermost one ovate, acute.—C. maritima, var. americana Torr.—Bunias maritima Pursh—B. edentula Big.

Hab. Sea coast. N. S. Shores of the great Northern lakes, Nutt. July—Oct. .—Plant fleshy, branched and decumbent. Flowers purple, corymbed.

American Sea Rocket.

2. THLASPI. Linn.

Pouch emarginate at the apex; valves boat-form, winged on the back; cells 2—many seeded. Petals equal. Calyx equal at base. Tetradynamia. Siliculosa.

1. T. arvense Linn.: leaves oblong-sagittate, coarsely toothed, smooth; pouch suborbicular, shorter than the pedicel; its wings dilated longitudinally.

Hab. Stony fields. Can. and N. S. W. to Miss. June. Stem a foot high, erect, somewhat branched. Leaves smooth. Flowers small, white, in a raceme. Pouch very large, with dilated wings.

Penny-cress.

2. T. tuberosum Nutt.: leaves rhombic-ovate, obsoletely toothed, smooth, sessile; radical ones upon long petioles; stem pubescent, very short and simple; root tuberous; pouch orbicular.

HAB. Penn. Nutt. April, May. @.—Stem 4—5 inches high.

Flowers large, rosaceous.

3. CAPSELLA. De Cand.

Pouch triangular, wedgeform at base; valves boat-form, not winged; cells many-seeded. Tetradynamia. Siliculosa.

C. pursa-pastoris De Cand.; radical leaves pinnatifid.

4. ALYSSUM. De Cand.

Pouch orbicular or elliptic; valves flat, or convex in the centre. Seeds 2-4 in each cell, compressed, sometimes sur-

rounded by a membranous wing. Calyx equal at base. Petals entire. Stamens somewhat toothed.

Tetradynamia. Siliculosa.

A? dentatum Nutt. : stem erect and herbaceous; radical leaves subruncinately toothed and somewhat scabrous; cauline ones linearlanceolate, sessile, nearly smooth; racemes paniculate; pouch elliptical, compressed, pubescent, contorted, terminating in a style near its own length, shorter than the pedicel.-Draba arabisans Pursh, not of Mich. (Nutt.).

HAB. Rocks. N. S.? May. 21.—Stem 6 inches high. plant is probably not a native of the northern section of the U.S.

5. DRABA. Linn.

Pouch sessile, oval or oblong; valves flat or convex. Seeds many, not margined. Calyx equal. Petals entire. Stamens without teeth. Tetradynamia. Siliculosa.

1. D. caroliniana Walt. : stem leafy at the base, hispid, naked and smooth at the top; leaves ovate-roundish, entire, hispid; pouch linear, smooth, longer than the pedicels .- D. hispidula Mich.

Hab. Fields. Penn. to Geor. W. to Miss. April. . Stem 2-4 inches high. Leaves clustered on the lower part of the stem, very hairy. Pouch 1-2 an inch long, linear-lanceolate.

Flowers white.

2. D. arabizans Mich.: stem leafy, somewhat branched, subpubescent; leaves lanceolate, acute, toothed; pouch linear, smooth, longer than the pedicel.

HAB. Rocks. Can. to Virg. W. to Miss. May, June. O.-Pouch 5-6 lines long, erect, acuminate, twisted. Flowers white.

6. EROPHILA. De Cand.

Pouch oval or oblong; valves flat. Seeds many, not margined. Calyx equal. Petals 2-parted. Stamens without teeth. Tetradynamia. Siliculosa.

E. vulgaris De Cand. : pouch elliptic, shorter than the pedicel ; scape 5-15 flowered. - E. americana De Cand. ?-D. verna Pursh. Nutt.

AB. Fields. Can. to Virg. March—May. . —Scape 2—6 inches high. Leaves lanceolate, subincised, hairy. Flowers white. Specimens of this plant obtained from my friend, Dr. Matthew Stevenson, of Washington co. N. Y. agree in all respects with the foreign E. rulgaris, as do also those which I have collected elsewhere. Whether E. americana of De Candolle is a mere variety of this, I have no means of determining; but I think there can be no doubt that Draba caroliniana (D. hispidula Mich.) is entirely distinct from the present plant.

Whitlow Grass.

7. COCHLEARIA. Linn.

Pouch sessile, ovate, globose or oblong; valves ventricose. Seeds many, not margined. Calyx equal, spreading. Petals entire. Stamens without teeth. Tetradynamia. Siliculosa.

C. armoracca Linn.: root large, fleshy; radical leaves oblong-crenate; cauline ones long-lanceolate, toothed or incised; pouch elliptical.

HAB. Waste grounds. June. 2f.—Root large and very pungent to the taste. Stem 2 feet high. Flowers white, in elongated racemes. Introduced.

Horse Radish.

8. LEPIDIUM. Linn.

Pouch ovate or somewhat cordate; valves keeled or rarely ventricose, dehiscent; cells 1-seeded. Seeds somewhat triquetrous or compressed. Tetradynamia. Siliculosa.

1. L. rirginicum Linn.: stem branched; radical leaves pinnatifid; stem leaves linear-lanceolate, serrate, smooth; flowers with 4 petals and 2—4 stamens; pouch orbicular, flat, emarginate, shorter than the pedicel.—Thlaspi virginianum Poir.

Hab. Sandy fields. Can. to Geor. W. to Miss. June—Oct.

— Stem a foot high, panicled above. Flowers minute, white.
Closely resembles L. ruderale, but the cotyledons are accumbent.
Hooker. Wild Pepper-grass.

2. L. campestre Brown: cauline leaves sagittate, toothed; pouch ovate, winged, emarginate, scaly-punctate.—Thlaspi campestre Linn.

HAB. Hills. N. S. May. . - Stema foot high, erect. Leaves pubescent. Flowers white. Field Pepper-grass.

3. L. hirtum Smith: pouch ovate, winged, emarginate, hirsute; cauline leaves sagittate, villose, sub-dentate.

HAB. Fields, near New-Brunswick, N. J. June. 3.—Stem 12—18 inches high, very leafy. Lower leaves petioled, and somewhat pinnatifid; stem leaves sub-clasping, sagittate, toothed, covered with a whitish pubescence. Flowers in dense lairy racemes. Pouch, in my specimens, scabrous, emarginate, with a style about half its length.—Perhaps introduced.

Hairy Field Pepper-grass.

9. CAMELINA. Crantz.

Pouch obovate or subglobose; valves ventricose, dehiscent with part of the style; cells many seeded. Style filiform. Seeds oblong, not margined. Tetradynamia. Siliculosa.

C. sativa De Cand.: pouch obovate-pyriform, margined, tipped with the pointed style; leaves roughish, subentire, lanceolate, sagittate; flowers numerous, in corymbs.—Myagrum sativum Linn.

Hab. Cultivated grounds. Penn. June. ②.—Stem about 2 feet high, branched above. Flowers numerous, in corymbs, small, yellow. Pouch on a long pedicel. Introduced. Gold of Pleasure.

> SUBULARIA. Linn. 10.

Pouch oval; dissepiment elliptical; valves convex; cells Stigma sessile. Cotyledons incumbent, linmany seeded. ear, 2-plicate. Tetradynamia. Siliculosa.

S. aquatica Linu.

HAB. Margins of ponds. N. S. July. @ .- Scape 1-2 inches high. Radical leaves entire, subulate 10 lines long. Flowers white, in corymbs. Awl-wort.

11. LUNARIA. Linn.

Pouch pedicellate, elliptic or lanceolate; valves flat. icles long, adhering to the dissepiment. Calyx somewhat bisaccate. Petals nearly entire. Stamens not toothed.

Tetradynamia. Siliculosa.

L. biennis De Cand.: pouch elliptical, obtuse at each end. HAB. Fields. Penn. May, June. J .- Naturalized near Philadelphia. Nutt.

DIV. II. SILIQUOSÆ.

12. DENTARIA. Linn.

Pod lanceolate; valves flat, nerveless, often opening elastically. Seeds ovate, not margined, in one row.

Tetradynamia. Siliquosa.

1. D. laciniata Muhl.: leaves in threes, verticillate, on short petioles, ternate; leafets 3-parted; segments linear, entire, or coarsely toothed; root moniliform .- D. concatenata Mich.

HAB. Woods. Throughout the U.S. but rather rare. April. May. 24.—Stem 8 inches high. Flowers in terminal racemes, pale rose coloured or nearly white. Petals oblong.

2. D. diphylla Mich.: leaves mostly 2, on short petioles, ternate; leafets ovate-oblong, unequally and coarsely serrate or laciniate.

HAB. Woods. Throughout Can. and U. S. May. 21 .- Stem 6-10 inches high. Leaves large. Flowers white, larger than the preceding. Toothwort.

3. D. heterophylla Nutt.: stem 2-leaved; leaves ternate, petiolate; leafets linear, sub-lanceolate, acute, entire, margin rough ciliate; radical leafets ovate-oblong, incisely and coarsely toothed.

HAB. Woods. Penn. June. 21.—Root tuberous. Corymb about 9-flowered. Flowers pale purple, about the size of those of Cardamine pratensis.—The smallest of the genus.

4. D. maxima Nutt.: leaves many, alternate, on long petioles, ternate; leafets sub-oval, incisely and acutely toothed, lateral ones lobed; axils naked; racemes lateral and terminal.

HAB. Woods. N. Y. and Penn. June. 21.-Stem 18-20 inches high. Leaves 5-7; leafets broad. Flowers in racemes, purple.

13. BARBAREA. Brown.

Pod 4-sided, 2-edged; valves awnless at the apex, concave-carinate. Calyx equal at base.

Tetradynamia. Siliquosa.

B. vulgaris Brown: lower leaves lyrate, the terminal lobes roundish; upper ones sessile, obovate, toothed; pod 4-sided, tapering into a slender style.—Erysimum barbarea Linn.

Hab. Fields. N. S. and N. to the Arctic regions. June. 21.
—Stem 12—18 inches high, smooth. Flowers small, yellow, corymbed. - According to Dr. Hooker the best character between this species and B. pracox is in the pod, which is here scarcely more than an inch long and tapers into a long slender style.

Bitter Winter-cress.

14. ARABIS. Linn.

Pod linear; valves flat, 1-nerved in the middle. Seeds in one row in each cell, oval or orbicular, compressed. Cotyledons flat, accumbent. Tetradynamia. Siliquosa.

- 1. A. sagittata De Cand.; leaves subdentate, rough, with the pubescence often branched; radical ones ovate or oblong, attenuated into a petiole; those of the stem lanceolate, sagittate-cordate; pedicels of the length of the calyx; pods stiffly erect.
 - c. ovata De Cand.: leaves rough; radical ones ovate, toothed; cauline ones clasping.—A. ovata Poir.—Turritis ovata Pursh.
 - d. oblongata De Cand.: leaves rough; radical ones ovate-oblong. toothed; cauline ones sagittate-amplexicaul. - Turritis oblongata Raf.
 - HAB. Rocks. N. S. N. to Arctic America. & .- Stem 12-18 inches high, simple. Flowers small, white. A very variable plant.
- 2. A. hirsuta De Cand.: leaves dentate, pubescent or scabrous; radical ones obovate-oblong, tapering into a petiole; cauline ones ovatelanceolate; pedicels as long as the calyx; pod erect.—Turritis hursuta Jacq.
 - HAB. Conn. June. 3.—Stem 6—12 inches high, hairy. Flowers small, white. A specimen of this plant, gathered in Connecticut by Dr. Robbins, agrees very well with the foreign one, from which it seems to me our A. sagittata is quite distinct.

Hairy Tower Mustard.

3. A. thaliana Linn.: stem branched; leaves subdentate, pilose; the radical ones petiolate, ovate-oblong; cauline ones few, sessile; 3*

stamens as long as the petals; pod suberect, on longish pedicels, slender.

HAB. Dry hills. N. S. April, May. @ .- Stem 2-8 inches Common Wall-cress. high. Flowers in a corymb, white.

4. A. lyrata Linn.: stem somewhat branched, hairy at base; radical leaves lyrate-pinnatifid, often pilose; those of the stem linear and smooth; pedicels somewhat spreading; pod erect.

Hab. Fields and hills. Throughout the N. S. and Can. and W. to Rocky mountains. April, June. 3.—Stem 8—12 inches high. Flowers large, white. Dr. Hooker supposes this plant to be identical with the European A. petræa.

5. A. lavigata De Cand.: erect, glabrous and glaucous; radical leaves, obovate, petioled, sinuate-dentate; stem leaves linear, sessile, very entire; pod erect; seeds margined.—Turritis lavigata Willd.

HAB. Rocky places. N. S. May. 21.—Stem a foot to 18 inches high. Flowers few, small, in corymbed racemes. Pod 2 inches long, linear, quite erect, tapering at the extremity into a very short style.

6. A. canadensis Linn.: stem leaves sessile, oblong-lanceolate, acuminate, somewhat toothed; pedicels thrice as long as the calyx, pubescent, reflexed in the fruit; pod pendulous, subfalcate, nerved; seeds with a broad wing .- A. falcata Mich. Pursh .- A. mollis Raf.

HAB. Rocky situations. Can. to Geor. June. 21, -Stem 1-2 feet high. Flowers white, in long terminal racemes. Pods very long. Sickle Pod.

15. CARDAMINE. Linn.

Pod linear; valves flat, nerveless, often opening elastically. Seeds ovate, not margined; funicle of the hilum slender. Tetradynamia. Siliquosa.

* Leaves undivided.

1. C. rhomboidea De Cand.: root tuberous; leaves ovate-rhomboid. obscurely repand-toothed, smooth, lower ones on long petioles.—Arabis rhomboidca Pursh. Pers.

HAB. Low grounds. From Hudson's Bay to S. Car. and W. to the Rocky mountains. May, June. 21.—Stem 6-12 inches high, erect, smooth, simple. Flowers in terminal racemes, large, white.

2. C. rotundifolia Mich.: root fibrous; leaves suborbicular, subdentate. smooth, petioled; stem weak, procumbent; pod spreading, slender. with a long style.

AB. Wet grounds. N. S. July. 21.—Stem 12—15 inches high. Flowers small, white. Dr. Hooker considers the two HAB. preceding plants identical; but Dr. Darlington, who has examined this point with much care, has designated the characters by which they are distinguished. The roots of C. rotundifolia are constantly fibrous, while those of C. rhomboidea are tuberous; the flowers of the former are not more than half the size of th. latter; the stigma is simple and very small, on a tapering style, nearly a line in length; neither is the plant so acrid, being rather bitter to the taste. See Darlington's Florula Cestrica, and his paper in Sill. Amer. Jour. xvii. 356.

3. C. bellidifolia Linn.: leaves glabrous, somewhat fleshy; radical ones petioled, ovate, entire; cauline ones few, entire, or somewhat 3-

lobed; pod erect; stigma subsessile.—C. rotundifolia? Big.

HAB. Highest summit of the White mountains, Rocky mountains, and throughout Arctic America. July. 21.—I received a specimen of this plant from my friend Dr. Charles Pickering of Philadelphia, who obtained it from the first named locality. The stem is simple and apparently procumbent, 4—5 inches long. Lover leaves 1.2—3-4 of an inch in length, ovate or suborbicular, on long slender petioles. Pod an inch long, surmounted by a short style. It is very near C. alpina.

** Leaves divided.

4. C. pratensis Linn.: leaves pinnate; leafets of the radical ones roundish, of the cauline ones linear or lanceolate, entire; flowers large, in a terminal corymb; style very short, nearly as thick as the pod: stigma capitate.

Hab. Woods. N. S. and throughout Arctic America. June. 21.—Stem 10-12 inches high. Flowers purplish, large. Pod linear, nearly an inch long. This species can be readily distin-

guished by its large flowers and thick style.

5. C. hirsuta Linn.: leaves pinnate; leafets of the radical ones petioled, mostly rounded; of the cauline ones lanceolate, subpetioled, dentate or very entire; petals small, oblong-cuneate; stigma minute, subsessile.—C. pennsylvanica Muhl. De Cand.—C. virginiana Linn.

HAB. Wet grounds. Throughout the U. S. and Can. July. . —I adopt the views of Dr. Hooker concerning this species. I have never been able to ascertain the specific line between the C. pennsylvanica and C. virginica of American botanists; having seen every variety in the size, form of the leaves, and direction of the stem, of these supposed distinct plants. The present species is very extensively distributed. American Water-cress.

6. C. teres Mich.: leaves sublyrate-pinnatifid, segments oval-oblong, the terminal one somewhat 3-lobed; pod short, erect, terete.

II_{AB}. Low grounds. N. Eng. to N. J. Pursh. June, July.
21.—De Candolle thinks this may belong to his genus Nasturtium.

16. NASTURTIUM. Brown.

Pod rounded (sometimes short.) Stigma sub-2-lobed. Valves concave, nerveless, not keeled. Cotyledons accumbent. Calyx spreading. Tetradynamia. Siliquosa.

1. N. officinale Brown: leaves pinnate; leafets ovate, subcordate, sinuate-dentate; upper ones pinnatifid.—Sisymbrum Nasturtium Linn.

HAB. In water. Throughout the U.S. and to the N. W. coast. June, July. 21.—Stem decumbent, floating. Leaves large. Flowers white, corymbed. Pod scarcely an inch long. Es-Water-cress. teemed as a salad.

2. N. palustre De Cand.: leaves lyrate-pinnatifid; lobes confluent, unequally toothed, smooth; petals as long as the calyx; pod obtuse at both ends, turgid; root fusiform. - Sisymbrium palustre Willd. Pursh.

HAB. Wet places. Throughout the U. S. and to the shores of the Arctic sea. July. — Stem 18 inches high, mostly erect. Leaves glabrous, all more or less pinnatifid. Flowers numerous, minute, yellow. Pod short.

3. N. amphibium Brown: leaves oblong-lanceolate, lyrate-pinnatifid or serrate; root fibrous; petals longer than the calyx; pod elliptical, tipped with the mucronate style.—Sisymbrium amphibium Linn.

HAB. Wet places. Throughout the U. S. and Can. June, July. 21.—Stem 1—2 feet high. Flowers yellow, minute, in a long raceme. Very variable in the character of its leaves.

4. N. natans De Cand. : emerged leaves lanceolate, entire, serrate ; immersed ones doubly tripinnatifid; segments capillaceous; pouch obovate-globose, with a style equal in length.

HAB. In water. Near Montreal. Hook. Oneida Lake. Dr. Asa Gray. July. 21.-Stems long, submerged. Lower leaves finely divided; middle ones often pinnatifid; emerged ones lanceolate, undivided, serrate. Flowers very pale yellow, smaller than in the preceding.

17. HESPERIS. Linn.

Pod roundish, or about 4 cornered. Stigmas 2, erect, connivent. Calyx bisaccate at base. Seeds somewhat 3-sided. Stamens without teeth. Tetradynamia. Siliquosa.

1. H. matronalis Linn .: pedicels of the length of the calvx; petals obovate; pod erect, torose, glabrous, not thickened on the margin; leaves ovate-lanceolate, toothed; stem erect, nearly simple.

HAB. Shore's of Lake Huron. Hook. Dame's Violet.

2. H.? pinnatifida Mich.: lower leaves lyrate-pinnatifid; upper ones lanceolate, unequally serrate; border of the petals obovate, entire; pedicels at length longer than the calyx.

HAB. Woods. N. S. Torr. W. to Ken. July. 21 .- Stem a foot

high, very smooth. Flowers pale purple, small.

18. SISYMBRIUM. All.

Pod roundish, sessile upon the torus. Stigmas 2, somewhat distinct, or connate in a head. Calyx equal at base. Seeds ovate or oblong. Cotyledons flat, incumbent, sometimes oblique. Stamens without teeth.

Tetradynamia. Siliquosa.

1. S. officinale De Cand.: leaves runcinate and with the stem hairy; flowers in a long raceme; pod subulate, pressed to the rachis.—Erysimum officinale Linn.

HAB. Road sides. Throughout the U. S. and Can. W. to Columbia river. June—Sept. ©.—Stem 1—2 feet high, branched.

Leaves hairy, or nearly smooth. Flowers yellow, minute. Varies much in the character of its leaves. Hedge Mustard.

2. S. sophia Linn.: leaves bipinnate, smooth or pubescent; segments oblong-linear, cut; petals shorter than the calyx; calyx thrice as short

as the pedicel; pod linear, erect.

Hab. Sandy places. Can. June, July. @.—Stem 8—12 inches high. Flowers yellow, numerous. Fruit-bearing-raceme very long. I have received a specimen of what I think must be the true S. sophia from Dr. Holmes of Montreal. The pods are very narrow-linear, 1-2 to 3-4 of an inch, longer and narrower than in S. canescens of Nuttall, and not clavate as in the latter. In other respects I cannot observe any difference between these two plants.

19. ERYSIMUM. Linn.

Pod four-sided. Calyx closed. Cotyledons flat, oblong.
Tetradynamia. Siliquosa.

1. E. cheiranthoides Linn.: leaves lanceolate, somewhat toothed and scabrous; pod erect-spreading, twice as long as the pedicel; stigma

small, nearly sessile.

IIAB. Fields. Near Fairfield, N. Y. Can. and on all the plains westward of the Rocky mountains. July. . Stem 1—2 feet high, erect, and with the leaves scabrous. Flowers yellow, in long terminal racemes. Pods linear, somewhat spreading, 1-2 to 3-4 of an inch long.

20. SINAPIS. Linn.

Pod roundish; valves bearing nerves; style small, short, acute. Seeds in one series, subglobose. Calyx spreading.

Tetradynamia. Siliquosa.

1. S. nigra Linn.: lower leaves lyrate; upper ones lanceolate, entire, petiolate; pod smooth and even, somewhat 4-sided, appressed to the peduncle.

HAB. Fields. N. S. June, July. ©.—Stem 2-4 feet high.

Flowers yellow.

Common Mustard.

2. S. alba Linn.: leaves lyrate, nearly smooth, the terminal lobe large; pod mostly hispid, spreading, shorter than the broad swordform beak; seeds large, pale.

HAB. Waste places. N. S. July. @.—Stem 1—2 feet high. Flowers yellow, rather large, corymbose. Introduced. White Mustard.

21. RAPHANUS. Linn.

Pod transversely many-celled or dividing into several joints. Seeds in one row, globose, pendulous.

Tetradynamia. Siliquosa.

R. raphanistrum Linn.: leaves simply lyrate; pod jointed, 1-celled, striate, 3—8 seeded, longer than the style.

HAB. Fields. N. S. July. O .- Stem 1-2 feet high, hispid. Flowers yellow, large. Wild Radish.

ORDER XIII. CAPPARIDEÆ. De Cand. Lind.

Sepals 4. Petals 4, cruciate, usually unguiculate and unequal. Stamens 4, 6, or indefinite, but usually some high multiple of four. Disk hemispherical or elongated. Fruit either pod-shaped and dehiscent, or fleshy and indehiscent, rarely 1-seeded, most frequently with 2-polyspermous placentæ. Seeds generally reniform; albumen none; embryo incurved; cotyledons foliaceous.

Herbs, without true stipules, but sometimes with spines in their places. Leaves alternate, petioled, undivided or palmate.

1. GYNANDROPSIS. De Cand.

Calyx of 4 sepals, spreading. Petals 4. Torus elongated. Stamens 6, united around the torus, free at the apex. Pod stiped. Tetradynamia. Siliquosa.

G. pentaphylla De Cand.: smoothish; leaves quinate; the lower and floral ones ternate; leafets entire and subserrulate.—Cleome pentaphylla Linn.

Hab. Sandy fields. N. S. to S. Car. July. @.—Stem 2 feet high, viscid. Flowers white, in long terminal racemes. Petals obovate, with very long capillary claws. Pod long, linear, on a long foot-stalk.

2. POLANISIA. Raf.

Calyx of 4 sepals, spreading. Petals 4. Stamens 8-32. Torus small. Pod sessile or scarcely stiped. Style distinct.

Tetradynamia. Siliquosa.

P. graveolens Raf.: viscidly pubescent; leaves ternate; leafets elliptical-oblong; stamens 8—12; pod oblong, attenuate at base, muricate with a glandular pubescence.—Cleome dodecandra, var canadensis Linn.

HAB. Sandy places. N. S. and Can. W. to Miss. June. 24.—

Stem 8—12 inches high. Flowers purple and yellow. Whole plant more or less viscid and fetid.

ORDER XIV. CISTINEÆ. De Cand. Lind.

Sepals 5, persistent, unequal, the three inner with a twisted aestivation. Petals 5, hypogynous, very fugitive, crumpled in aestivation and twisted in a direction contrary to that of the sepals. Stamens indefinite, hypogynous, free; anthers innate; stigma simple. Ovary distinct, 1 or many celled; style single. Fruit capsular, usually 3-5-10-valved, either 1-celled with parietal placentæ in the axis of the valves, or imperfectly 5 or 10-celled with dissepiments proceeding from the middle of the valves, and touching each other in the centre. Seeds indefinite in number. Embryo inverted, either spiral or curved in the midst of mealy albumen.

Shrubs or herbs. Leaves usually entire, opposite or alternate. Flowers very fugacious.

1. HELIANTHEMUM. Tourn.

Calyx with 3 equal sepals, or 5 disposed in two rows, the two outer ones often smaller, rarely larger. Petals 5, often irregularly denticulate at the apex. Stigma capitate. Ovary triquetrous. Capsule 3-valved, with the dissepiment in the middle of the valves. Seeds angled, smooth.

Polyandria. Monogynia.

* Peduncles one-flowered.

- 1. H. canadense Mich.: stem ascending; branches erect, hirsute; leaves oblong-lanceolate, acute, hirsute, paler beneath; peduncles solitary, 1-flowered; sepals broad-ovate, acuminate; capsule shorter than the calyx.
 - HAB. Margins of woods. Can. to Car. June. 21.—Stem a foot high. Raeemes few-flowered, generally terminal. Flowers yellow, large. Rock Rose. Frost Weed.
- 2. H. ramuliforum Mich.: stem erect, pulverulent-pilose, branching, subdichotomous at the apex; branches virgate, flower-bearing; leaves lanceolate-elliptic or oblong, acute, margin scarcely revolute, white tomentose beneath; flowers peduncled, solitary; sepals broad-ovate, acuminate; capsule globose, of the length of the calyx.

HAB. Fields. N. J. to Car. 21. July.—Stem a foot high. Flowers yellow, small. Calyx and peduncles pilose. Style very

short.

** Peduncles many flowered.

3. H. corymbosum Mich.: stem suffruticose, branching, erect; branches dichotomous, subpubescent; leaves alternate, lanceolate-oblong, somewhat obtuse, white, tomentose beneath; upper ones revolute on the margin; flowers in crowded fastigiate corymbs; sepals tomentose and whitish hirsute, outer ones linear-obtuse; inner ovate, acute, scarcely as long as the capsule.

Hab. Sandy fields. N. J. to Geor. June—Aug. 21.—This plant is said by Pursh to have the flowers very small and sometimes without petals. On the other hand, Elliott remarks that although the flowers are much smaller than those of H. carolinianum, they are nearly equal in size to those of our other species. Perhaps the assertion of Pursh that this and the foregoing species have been mistaken for Lechca major will apply to himself.

2. LECHEA. Linn.

Calyx 3-sepalled, with two outer bracts or sepals. Petals 3, lanceolate. Stamens 3—12, and often thrice the number. Ovary 1, 3-sided. Stigmas 3, scarcely distinct. Capsule 3-valved, with as many inner valves opposite the others. Seeds affixed to the dissepiment or nerve, very few, often 8.

Triandria. Trigynia.

1. L. villosa Ell.: radical branches prostrate, villose; leaves oblong-lanceolate, mucronate, pilose; panicle short, leafy; flowers fasciculate-racemose, secund, on very short pedicels.—L. minor Linn.—L. major Mich. Pursh. Torr.

Hab. Barren soil. Can. to Flor. July. 21.—Stem 1—2 feet high. Flowers brown.

Pin Weed.

2. L. minor Pursh.: nearly smooth; stem assurgent; leaves linear-lanceolate, acute; panicle leafy; branches elongated; flowers on short pedicels.

Hab. Dry hills. Can. and N.S. July. 21.—Stem 8—12 inches high. Fruit larger than in the former.

3. L. racenulosa Mich.: whole plant covered with appressed pubescence; stem erect; leaves linear, acute, ciliate; panicle slender and very branching; raceme naked; flowers small, alternate, pedicellate.

HAB. Sandy Hills. N. J. to Car. July. 24. Pursh.

4. L. thymifolia Pursh.: whole plant whitish-villose; stem erect; leaves linear, acute; panicle leafy, elongated; branches very short; flowers minute, in lateral and terminal fascicles; pedicels very short.

Hab. Sands. N. Y. to Virg. July. 21.—Stem a foot high, erect, much branched. Leaves villose at base.

3. HUDSONIA. Linn.

Calyx 5-parted; segments unequal, the two outer ones minute. Petals 5. Stamens 9-30. Style straight, simple.

Stigma simple. Capsule 1-celled, 3-valved, 1-3 seeded. Seeds granulated. Polyandria. Monogynia.

1. H. cricoides Linn.: pubescent; stem suffruticose, sub-erect; branches elongated; leaves filiform, subulate, subimbricate; peduncles numerous, lateral, elongated; calyx cylindrical, obtuse; capsule pubescent, 1-seeded; valves oblong.

Hab. Pine barrens. N. J. to Virg. May, June. b.—Stem 4—6 inches high, much branched. Leaves small, persistent. Flowers small, yellow. Stamens about 15. False Heath.

2. H. tomentosa Nutt.: cespitose, hoary-pubescent; leaves minute, closely imbricate, ovate, acute; flowers aggregated, subsessile; calyx sub-cylindric, with obtuse segments; capsule 1-seeded; valves ovate, smooth.

Hab. Sea shore. N. J. to Virg. June. 5.—Stem 6 inches high. Flowers yellow. Stamens 14—18. The whole plant is silvery gray and tomentose.

ORDER XV. VIOLACEÆ. De Cand. Lind.

Sepals 5, persistent, with an imbricate æstivation. Petals 5, hypogynous, equal or unequal, usually withering, and with an obliquely convolute æstivation. Stamens 5, alternate with the petals, occasionally opposite to them, inserted in a hypogynous disk, often unequal; anthers bilocular, bursting inward, either separate or cohering, and lying close upon the ovary; filaments dilated, elongated beyond the anthers; two of them, in the irregular flowers, generally furnished with an appendage or gland at the base. Ovary 1-celled, many-seeded, or rarely 1-seeded, with 3 parietal placentæ opposite the 3 outer sepals; style single, usually declinate, with an oblique hooded stigma. Capsules of 3-valves, bearing the placentæ in their axis. Seeds often with a tumour at their base. Embryo straight, erect, in the axis of fleshy albumen.

Herbs or Shrubs. Leaves simple, usually alternate, stipulate, with an involute vernation. Inflorescence various.

1. VIOLA. Tourn.

Sepals 5, auricled at their base. Petals unequal, the lower one spurred. Stamens 5, approximated; filaments distinct; anthers connate, the two lower ones with processes at their back. Capsule 1-celled, 3-valved, opening elastically.

Pentandria. Monogynia.

Tentameria, monegyma,

OBS. The North American species of this interesting genus have been studied with much care by the Rev. L. de Schweinitz and by Capt. Le Conte, and those of the Northern and Middle States have been no less faithfully examined by Dr. Torrey.—See Sill. Jour. vol. v. Ann. of the New York Lyc. vol. ii. Torrey's Flora, vol. i.

* Stemless.

† Flowers blue.

1. V. pedata Linu.: leaves pedate, often nearly smooth, from 5—7 parted; segments linear-lanceolate, entire or somewhat toothed; stipules radical, pectinately lacerate; petals beardless, entire, rounded at the extremity; stigma large, compressed, obliquely truncate and perforate at the apex.—V. digitata Pursh.

HAB. Rocky hills. From lat. 53 N. to Geor. W. to Miss. May. 21.—Scapes 3-5 inches high, several from the same root.

Flowers large, pale blue.

- 2. V. palmata Linn: leaves more or less pubescent, reniform-cordate, palmate, or hastate-lobed; lobes very various, the intermediate one always larger; stipules lanceolate, subciliate; lateral petals densely bearded towards the base; stigma capitate, recurved, margined, rostrate.
 - HAB. Swamps and low grounds. Can. to Car. May. 21.—Scape about as long as the leaves. Flowers middle-sized. This species varies greatly in the form of its leaves, and in some specimens they are so slightly divided, as to induce me to concur in the opinion expressed by Dr. Bigelow that it is only a variety of V. eucullata.
- 3. V. cucullata Ait.: smoothish; leaves cordate, cucullate at base, dentate-serrate, veined; stipules small, linear, ciliate; flower oblique: lower and lateral petals rigidly bearded; upper one smooth; spur very short, rounded.—V. papilionacea Pursh.—V. affinis Le Conte.—V. obliqua Ait. Pursh. Torr. V. sororia Pursh.
 - Hab. Wet meadows. Common throughout Can. and the U.S. April, May. 21.—This species varies considerably in the form of its leaves, and in the degree of pubescence. The same individual, indeed, undergoes changes during the season. A specimen in the herbarium of my brother, Dr. T. R. Beck, labelled by the late Dr. Muhlenburg V. obliqua? is certainly identical with this species.
- 4. V. sagittata Ait.: leaves pubescent on the upper surface, oblong, acute, cordate, sagittate, often hastate at base, serrate or crenate-dentate; petals oblong, ovate, all except the lower one bearded. V. dendata Pursh.
 - b. emarginata Nutt.: leaves almost triangular, lacerately toothed
 at the base; petals emarginate or bi-dentate.—V. emarginata Le
 Contc.
 - HAB. Fields. Can. to Car. May. 21.—Leaves quite variable.

 Flowers middle-sized, purple.—Var. b. is found in the sandy fields of New-Jersey.

- 5. V. ovata Nutt.: leaves oblong-ovate, rather acute, subcordate, crenate, often lacerately toothed at base, decurrent on the petiole, pubescent on both sides; stipules broad-lanceolate, ciliate; sepals oblong-lanceolate; petals obovate, entire; lateral ones densely bearded. V. primulafolia Parsh.—V. ciliata Muhl.
 - Hab. Dry hills. Can. and N. S. April, May. 21.—Whole plant pubescent. Leaves much narrower and more downy than in C. cueullata. Flowers larger than those of V. primulæfolia.
- 6. V. villosa Walt.: leaves reniform-cordate or reniform, obtuse, crenate, flat, very pubescent; sepals oblong, auriculate at base; lateral and lower petals bearded; stigma deflexed; capsule smoothish.—
 V. barbata Muhl.
 - b. cordifolia Nutt.: leaves smooth beneath, rather acute; sepals narrow, short, smooth and scarcely produced at base.—V. cordifolia Scho.
 - Hab. Rocky hills. Penn. to Car. May. 21.—Leaves rather thick, mostly incumbent on the ground, often purplish on the under side. Scape longer than the leaves.

tt Flowers yellow.

- 7. V. ratundifolia Mich.: leaves broad-ovate or orbicular, cordate, with the sinus at length closed, slightly crenate, smooth beneath; stipules lanceolate-subulate; sepals oblong, narrow, obtuse; lateral petals bearded; lower ones smaller, smooth; spur very short; stigma recurved.
 - Hab. Rocky woods. Can. to Car. May. 21.—Flowers yellow, middle sized. Distinct from V. clandestina of Pursh.

††† Flowers somewhat regular, small, white.

- 8. V. lanceolata Linn.: leaves very smooth, narrow lanceolate, attenuated at each end, sub-serrate; sepals lanceolate, acute, smooth; petals beardless, nearly equal; spur very short; stigma recurved, rostrate.
 - Hab. Swamps. Can. to Car. W. to Lake Huron. April, May. 2f.—Scape nearly as long as the leaves. Flowers small, white, inodorous. The long narrow leaves will sufficiently distinguish this species.—One of the finest localities that I have met with, is a swamp about a mile west of Albany.
- 9. V. acuta Big.: leaves ovate, smooth, crenate, rather obtuse; stipules linear-subulate; scape angular; bracts nearly as long as the petals; sepals lanceolate, acute, smooth; petals ovate, acute, mostly smooth, lower ones veined; stigma capitate, rostrate.
 - Hab. Moist grounds. Cambridge, Mass. Big. 21.—A small species. Distinguished by its even and always acute petals and by its long linear bracts.
- 10. V. primulafolia Linn.: leaves smooth, oblong ovate or lanceolate, subcordate, rather obtuse, sparingly crenate; nerves beneath and scape somewhat pubescent; sepals lanceolate; petals obtuse; the two lateral ones a little bearded and striate; stigma capitate, rostrate.

- Hab. Wet grounds. N. Y. to Car. April, May. 24.—Flowers white, odorous, about the size of those of V. lanccolata. Bracts long. This species varies in the form of its leaves from the broad-cordate to the lanccolate. Near New-Brunswick, where what I consider the V. primulafolia is very abundant, it certainly passes into V. lanecolata, with which species I think it will eventually prove identical. Dr. Bigelow suggests that V. blanda and V. lanccolata may be the same; but so far as my observation extends, the former is much more constant in its characters than V. primulafolia.
- 11. V. blanda Willd.: leaves broad-cordate, remotely scrrate or crenate, nearly smooth; sinus rounded; scpals ovate, acuminate; petals ovate, obtuse, nearly beardless; stigma depressed, acutely margined.

Hab. Wet meadows. From lat. 66° N. to Car. April, May. 21.—Flowers small, white, streaked with purple, odorous. This species very closely resembles the foreign V. palustris.

12. V. clandestina Pursh: cespitose; leaves large, suborbicular, obtuse, thin, nearly smooth, crenate, serrate; sinus closed, cordate; stipules ovate, short; stolons floriferous; petals narrow, ovate, beardless, scarcely longer than the calyx; flowers often apetalous; stigma straight, capitate.

Hab. Shady woods on mountains. Can. and N. S. June—Sept. 21.—Flowers often apetalous, generally concealed in the earth. More nearly allied to V. rotundifolia than to V. blanda, but dis-

tinct from both.

** Caulescent.

13. V. canadensis Linn.: stem erect; leaves broad-cordate, acuminate, serrate, slightly pubescent on the nerves, lower ones on long petioles; stipules broad-lanceolate, membranaceous, entire; sepals subulate, lanceolate; spur very short; stigma short, pubescent; capsule oblong, 3-sided, very obtuse.

HAE. Fields. Throughout Can. and the U. S. May-July. 21.—Stem 12—18 inches high. Flowers large, blue without,

pale within.

- 14. V. ochroleuca Schw.: stem assurgent; leaves alternate, lower ones round-cordate, crenate-serrate, obtuse, upper ones acuminate; stipules large, oblong-lanceolate, dentate-ciliate; sepals subulate-lanceolate; petals obtuse; the lateral ones and often the lowest profusely bearded; spur produced, obtuse; stigma recurved, subpubescent.—V. striata Ait. Le Conte.
 - Hab. Swamps. N. S. May. 21.—Stem 6—10 inches. Flowers yellowish-white, large.
- 15. V. muhlenbergiana De Cand.: stem weak, subprostrate, branched, smooth; lower leaves reniform-cordate; upper ones a little acuminate, crenate-serrate, nearly smooth; stipules large, oblong-lanceolate, serrate-ciliate; sepals linear-lanceolate; petals obovate, obtuse, the lateral ones bearded; spur nearly one third the length of the corol;

stigma rostrate.—V. muhlenbergii Torr.—V. uliginosa and asarifolia Muhl.—V. debilis Pursh. Schw.

HAB. Swamps. Labrador, Can. and N. S. May. 21.—Stem 6—10 inches high. Flowers middle-sized, blue. My specimens of this plant agree in every respect with those of V. canina of Linnæus from Scotland and Switzerland.

16. V. rostrata Muhl.: stem diffuse, erect; leaves smooth, cordate, acute, serrate; sinus open; stipules large, lanceolate, serrate-ciliate; peduncles filiform, longer than the leaves; petals obovate, all beardless; spur longer than the corol.

Hab. Rocky hills. Can. and N. S. April, May. 21.—Stem 6—8 inches high, smooth. Flowers large, pale blue, with a very long horn or spur, by which this species can be easily recog-

nized

17. V. pubescens Ait.: villous-pubescent; stem elongated, erect, naked below; leaves broad-ovate, cordate, dentate, more or less acuminate; stipules large, ovate, somewhat toothed; lateral petals bearded; spur short, acuminate.—V. pennsylvanica Mich.

b. eriocarpa Nutt.: capsule densely villous.—V. eriocarpa Schw.
 HAB. Dry woods. Can. and N. S. W. to Council Bluffs. April,
 May. 21.—Stem 6—8 inches high. Flowers middle sized, yellow

18. V. hastata Mich.: smooth; stem erect, simple, leafy above; leaves on long petioles, cordate-lanceolate or hastate, acuminate; lobes obtuse, dentate; stipules minute, ciliate-dentate; lower petal dilated, sub-3-lobed; lateral ones slightly bearded; spur short; stigma truncate, hairy on the sides.

HAB. Mountains. Penn. Muhl. May. 21.—Stem 8—12 inches high. Flowers yellow.

19. V. tenella Muhl.: stem 3-sided, erect, mostly simple; lower leaves round, spathulate; upper ones lanceolate; stipules large, runcinate-pinnatifid; sepals ovate-lanceolate, nearly as long as the petals; lateral petals bearded; spur obtuse, not extended; nectaries short.—V. bicolor Pursh.—V. arvensis Ell.

HAB. Sandy hills. N. Y. to Car. W. to Miss. May. 21.—
Stem 2—4 inches high. Flowers small, bluish-white. De Candolle and Hooker consider this a variety of V. tricolor, while
Torrey thinks it is nearer to V. arvensis. I still think it distinct.

2. SOLEA. Ging. De Cand.

Scpals scarcely equal, carinate? not auricled at base, decurrent into a pedicel, at length reflexed. Petals nearly equal; lower one a little larger than the rest, and somewhat gibbous at base. Stamens approximate; filaments with short broadish claws at base.

Pentandria. Monogynia.

S. concolor De Cand .- S. stricta Spreng. ?- Viola concolor Fors.

Pursh. Torr.

HAB. Rocks. N. Y. to Car. W. to Miss.; rare. April, May. 21.—Stem 2—4 feet high, simple, erect. Leaves cuneate-lanceolate, sessile, irregularly toothed above. Peduncles short, 2—3 flowered. Flowers small, greenish. Calyx nearly as long as the petals. Spur none. I possess fine specimens of this plant which were gathered near Lebanon, N. Y.

ORDER XVI. DROSERACEÆ. De Cand. Lind.

Sepals 5, persistent, equal, with an imbricate estivation. Petals 5, hypogynous. Stamens distinct, withering, either equal in number to the petals and alternate with them, or 2 or 3 or 4 times as many. Ovary single. Styles 3—5, either wholly distinct or slightly connected at the base, bifid or branched. Capsule of 1 or 3-cells, and 3 or 5-valves, which bear the placentæ either in the middle or at the base. Seeds either naked or furnished with an arillus; embryo straight, erect, in the axis of fleshy or cartiloginous albumen; cotyledons rather thick.

Delicate herbs, often covered with glands. Leaves alternate, with stipulary ciliæ and a circinate vernation.

1. DROSERA. Linn.

Calyx deeply 5-cleft. Petals 5. Stamens 5. Styles 3-5, bipartite. Capsules superior, 3-celled, 3-5 valved, many-seeded. Pentandria. Pentagynia.

1. D. rotundifolia Linn.: leaves all radical, orbicular, petiolate, spreading, covered above and on the margin with crimson hairs; petioles long, hairy; scape bearing a simple terminal raceme; seeds arillate.

Hab. Sphagnous swamps. From Arctic America to Car. July, Aug. 24.—Scape 4—8 inches high. Flowers small, whitish.

Sundewa

2. longifolia Linn.: leaves crenate-obovate, tapering below into a long petiole, erect-spreading; scape declined at the base; stipules many-cleft, capillaceous; segments of the calyx ovate-oblong, obtuse.—D. americana Muhl.—D. foliosa Ell.

HAR. Swamps. N. Y. to Car. July, Aug. 24.—Scape 2-4 inches long. Racemes simple. Flowers secund.

3. D. filiformis Raf.: leaves filiform, very long, glandulous the whole length; scape longer than the leaves, simple or bifid.—D. tenuifolia Willd.

HAB. Swamps. Mass. N. J. and Del. Aug. Sept. 21.—Leaves 6—10 inches long. Flowers purple, few, in a one-sided raceme.

2. PARNASSIA. Linn.

Calyx 5-sepalled. Petals 5. Scales (or abortive stamens?) opposite to the claws of the petals, terminating in glandular bristles at the apex. Stamens 5. Stigmas 4, sessile. Capsules 4-valved, 1-celled. Scale arillate.

Pentandria. Tetragynia.

1. P. caroliniana Mich.: radical leaves cordate, orbicular-ovate, on long petioles; stem leaf sessile; flowers solitary, terminal; scales 3-bristled.—P. americana and P. ovata Muhl.?

Hab. Swamps. Can. to Car. Aug. Sept. 21.—Stem 12—18 inches high. Leaves mostly radical. Flowers large, yellowishwhite.

Parnassus Grass.

2. P. palustris Linn.: leaves all cordate; cauline one sessile; scales smooth, many-bristled.

Hab. Bog meadows. N. S. Can. and as far north as the Arctic circle. Florers white, veins of green or purple. Distinguished by the numerous, slender, white, pellucid hairs of its scale from all the other species of the genus.

ORDER XVII. POLYGALEÆ. De Cand. Lind.

Sepals 5, very irregular, distinct, 3 exterior, of which 1 is superior and 2 inferior; 2 inner ones (the wings) often petaloid. Petals 3—4, hypogynous, one inferior (the keel) the others alternating with the upper and lateral sepals; sometimes 5, and then the 2 additional ones minute and between the lateral and lower sepals. Keel sometimes entire, and then naked or crested; sometimes 3-lobed without a crest. Stamens 8, unequal, ascending, combined into a tube, which is split opposite to the upper sepal; anthers 1-celled, opening by a terminal pore, or very rarely by a longitudinal cleft. Ovary superior, 2-celled, with placentæ in the axis; the cells anterior and posterior, the latter often abortive; ovules 1, rarely 2, pendulous; style simple, curved; stigma simple. Fruit dehiscent or indehiscent. Seeds pendulous, with a copious fleshy albumen and a straight embryo.

Shrubs or herbs. Leaves generally alternate, mostly simple and always destitute of stipules. Flowers usually racemose, often small. Pedicels with 3 bracts.

1. POLYGALA. Tourn.

Sepals of the calyx persistent; two inner ones wingshaped and coloured. Petals 3-5, united to the stamens, lower one keelform. Capsule compressed, elliptic, obovate or obcordate. Seeds pubescent. Diadelphia. Octandria.

* Flowers in racemes or spikes.

1. P. vulgaris Linn.: stem herbaceous, procumbent; leaves linear-lanceolate, rather obtuse; flowers in a terminal spike, erect; wings of the calyx obtuse, longer than the corol.

HAB. Banks of the Mohawk, N. Y. Nutt. June. 21.—Stems numerous. Flowers blue, cristate. According to De Candolle

there are 7 varieties of this species.

2. P. incarnata Linn.: glaucous; stem erect, slender, nearly simple; leaves scattered, few, subulate; racemes spiked, oblong, with-

out glands; corol with a long tube.

- 3. P. cruciata Nutt.: stem fastigiate, winged at the angles; leaves whorled in fours, linear-lanceolate, punctate; spikes dense, sessile; flowers subcristate; wings of the calyx cordate, acuminate, mucronate.

Hab. Wet places. Can. to Geor. July, Sept. @.—Stem 8—12 inches high, with spreading branches. Flowers greenish-purple. Corol slightly fimbriate.

4. P. brevifolia Nutt.: stem erect, branched, winged at the angles; leaves whorled in fours, oblong-linear, short, sprinkled with resinous dots; spikes pedunculate, partly capitate; flowers subcristate; wings of the calyx cordate-ovate, acute, scarcely longer than the capsule.

Hab. Sandy swamps. N. J. to Ohio. July, Aug. . —Stem slender. Flowers brightish red. Resembles the former, but is quite distinct. Dr. Hooker thinks this may be the true P. cruciata of Linnæus, while the P. cruciata of Nuttall is distinct. But there is still some doubt with regard to the correctness of this opinion.

5. P. fastigiata Nutt.: stem slender and fastigiately branched; leaves alternate, linear, acute; spikes subcapitate, pedunculate; flowers subcristate; wings of the calyx spreading, ovate, acute, scarcely longer than the capsule.—P. setacca Muhl.

HAB. N. J. Q. Nutt.-Nearly allied to P. cruciata.

6. P. purpurea Nutt.: stem fastigiately branched; leaves alternate, oblong-linear; flowers beardless, imbricated in obtuse cylindrical

spikes; rachis squarrose; wings of the calyx cordate-ovate, erect, twice as long as the capsulc.—P. sanguinca Mich. Pursh.

HAB. Woods and hill sides, Throughout N. Amer. July, Aug. ©.—Stem 12—18 inches high. Flowers rose-coloured.

7. P. sanguinca Linn.: stem fastigiately branched; leaves alternate, narrow-linear; flowers beardless, in long and crowded spikes; rachis squarrose; wings of the calyx obovate, as long as the capsule.

HAB. Dry soils. N. J. to Car. July—Oct. . Stem 8—12 inches high. Flowers dark red. Allied to the former, but a much smaller plant, the leaves shorter and narrower, and with a longer and more loose spike; the rachis also is much more squarrose.

8. P. ambigua Nutt.: stem erect, virgately branched; leaves linear; the lower ones whorled; the rest scattered; spikes acute, on very long peduncles; flowers cristate; wings of the calyx round and veined, as long as the fruit; bracts deciduous.

Hab. Wet woods. N. J. and Virg. O.—Flowers purple, distinctly pedicellate, larger than those of the next species.

9. P. verticillata Linn.: stemerect, branched; leaves whorled, linear and remote; racemes spiked, acute, pedunculate; bracts deciduous; flowers cristate; wings of the calyx roundish, shorter than the capsule.

Hab. Sandy soils. Can. to Car. W. to Miss. July—Oct. S.—Stem 8—12 inches high, slender, slightly angled. Leaves sometimes solitary. Flowers small, greenish-white. Capsule sessile.

Dwarf Snake-root.

10. P. senega Linn.: stems numerous, erect, smooth, simple; leaves alternate, ovate-lanceolate; upper ones acuminate; racemes naked, spiked; wings of the calyx orbicular; capsule elliptical, emarginate.

HAB. Woods. Can. to Geor. June, July. 21.—Stem a foot high. Leaves pale green. Flowers whitish, in a terminal spike. The root is hard, firm and branching, and is much used in medicine. Big. Med. Bot. ii. 97. Bart. ii. 116. Seneka Snake-root.

11. P. polygama Walt.: stems numerous, simple, erect and procumbent; leaves linear-lanceolate, attenuate downwards; racenies filiform, terminal and lateral, elongated; lower ones procumbent, without petals; flowers sessile.—P. rubella Willd. Pursh.

Hab. Forests. Can. to Car. June, July. 21.—Stem 4—8 inches high, angular. Flowers purple. The whole plant is bitter and is used in medicine. Big. Med. Bot. iii. 129. Bitter Polygala.

** Flowers capitate, (yellow.)

12. P. lutea Linn.: stem simple or branched; lower leaves spathulate; upper ones lanceolate; flowers in globular heads, yellow; wings of the calyx ovate, mucronate; bracts shorter than the flowers.

Hab. Pine barrens. N. J. to Flor. June—Oct. 3.—Stem 8—16 inches high, mostly simple. Flowers bright yellow.

Yellow Polygala.

*** Flowers in corymbs.

13. P. ramosa Ell.: stem erect, branching, angular, corymbose at the summit, many-headed; radical leaves spathulate-obovate; cauline ones subequal, linear; wings of the calvx oblong-ovate, cuspidate.-

P. corymbosa Nutt. not of Mich.

HAB. Sphagnous swamps. Del. to Flor. July, Aug. 21.-Stem a foot high, sometimes branching from near the base. Flowers in small loose heads forming a very irregular corymby, yellow, dark green when dry. According to Elliott, P. corymbosa of Michaux is a distinct species, identical with P. attenuata of Nuttall.

**** Flowers axillary, (large.)

14. P. pauciflora Willd.: stem simple, erect, naked below; leaves ovate, acute, smooth; flowers mostly terminal and by threes, large, cristate, sometimes axillary.

b. alba Eights: flower solitary, smaller, white; stem somewhat

leafy at base.

HAB. Woods. Can. to Car. W. to Lake Huron. June. 24. —Stem 3—4 inches high. Flowers large, purple, with the summit of the keel densely crested. Var. alba was found by Dr. James Eights in the sand plains near Albany. It has the stem rather lower and more leafy than in the former; the flower also is solitary, smaller, white, and the keel less densely crested.

Flowering Wintergreen.

15. P. uniflora Mich.: herbaceous, small; leaves broad, oval, attenuated into a petiole; flowers not crested, solitary, scattered, pedecillate.

HAB. Borders of Can. Mich. This plant, which is probably a native of the Northern States, has been confounded with the former; but if Michaux has described it correctly, it must be distinct, as he says that the keel is not crested, and that the flowers are solitary and scattered.

CARYOPHYLLEÆ. De Cand. ORDER XVIII.

Sepals 4-5, continuous with the peduncle; either distinct or cohering in a tube, persistent. Petals 4-5, hypogynous, unguiculate, inserted upon the pedicel of the ovary; occasionally wanting. Stamens twice as many as the petals, inserted upon the pedicel of the ovary along with the petals; filaments subulate, sometimes monadelphous; anthers innate. Ovary stipitate on the apex of a pedicel (called the gynophorus); stigmas 2-5, sessile, filiform, papillose on the inner surface. Capsule 2-5 valved, either 1-celled or 2-5 celled, in the latter case with a loculicidal dehiscence. Placenta in the axis of the fruit. Seeds indefinite in number, rarely definite; albumen mealy; embryo curved round the subumen : radicle pointing to the hilum.

Herbs, occasionally becoming suffrutescent. Stems tumid at the articulations. Leaves always opposite and entire, often connate at the base.

1. DIANTHUS, Linn.

Calyx tubular, 5-toothed, with 2-4 opposite imbricate scales at base. Petals 5, with long claws. Stamens 10. Styles 2. Capsule 1-celled. Decandria. Digynia.

D. armeria Linn.: flowers in terminal crowded clusters; scales of the calyx lanceolate, villous, as long as the tube.

HAB. Sandy fields. N. J. July. S.—Stem 18 inches high. Flowers red, inodorous, small. Introduced. Pink.

2. SILENE. Linn.

Calyx tubular, 5-toothed, naked. Petals 5, unguiculate, mostly crowned at the orifice; limb bifid. Stamens 10. Styles 3. Capsule 3 celled at base, dehiscent at the top into 6 teeth.

Decandria. Trigynia.

- * Caulescent. Flowers solitary or panicled. Calyx inflated.
- 1. S. stellata Ait.: stem erect, branching, pubescent; leaves verticillate in fours, lanceolate, long-acuminate, smooth; flowers in panicles; calyx vesiculose, pubescent; limb of the petals fringed.—Cucubalus stellatus Linn.
 - HAB. Hill sides. Can. to Car. July, Aug. 21.—Stem 2—4 feet high. Flowers white; petals about 4-cleft. Calyx inflated. Star Campion.
- 2. S. inflata Smith: stem branching, smooth and glaucous, decumbent; leaves oblong-oval, acute, nerveless,; flowers paniculate; calyx vesiculate-ovate; petals bifid, naked; claws wedge-form; styles larger than the stamens.—Cucubalus behen Linn.
 - Hab. Rocky hills. Can and N. S. July. 21.—Stem 1—2 feet high. Flowers white; petals bifid. Calyx bladder like and beautifully veined.

 Bladder Campion.
- 3. S. nirca Muhl.: stem divaricate and dichotomous above; leaves oblong-lanceolate, minutely and puberulently pubescent, the uppermost ovate; calyx obtuse, bell-shaped, inflated, subpilose; petals small, reflexed, bifid at the extremity; claws exserted beyond the calyx, nearly naked; flowers solitary, dichotomal, terminal.—Cucubalus nizeus Nutt.
 - Han. "Upon an Island in the Susquehannah near to Columbia, Penn. Muhlenberg." Nutt. June, July. 21.—Stem smooth and slender. Leaves opposite, 2 inches long, and 1-2 an inch wide. Flowers white, remote, solitary, dichotomal and terminal. Nuttall quotes the above name from Muhlenberg as a synonym for his Cacubalus niveus, but I cannot find it in his catalogue. It may be the S. alba of Muhlenberg, and is perhaps only a variety of S. inflata.

- ** Caulescent. Flowers in axillary spikes, alternate. Calyx 10-striate.
- 4. S. nocturna Linn.: stem branched, pilose below; leaves pubescent, long ciliate at base; lower ones spathulate, upper ones linear-lanceolate; spike secund, dense; flowers sessile, alternate; calyx cylindrical, nearly smooth; petals 2-parted, narrow.

- *** Caulescent. Stem rigidly erect. Peduncles filiform. Calyx bellform or cylindrical.
- 5. S. antirrhina Linn.: almost smooth; stem erect, branching, somewhat leafy; leaves lanceolate, acute, subciliate, upper ones linear; flowers small, panicled; calyx ovate, glabrous; petals obcordate, crowned; stamens included.
- **** Caulescent. Flowers panieled, rarely solitary. Pedicels opposite, short. Calyx tubular.
- 6. S. catesbei Walt.: branching; leaves broad-lanceolate; flowers in panicles; calyx clavate, coloured; petals with long claws; limb bifid, with two lateral teeth; lobes acute.—S. virginica Mich. Pursh, not of Linn.
 - Hab. Penn to Miss. Muhl. June. 21.—Stem a foot high; Flowers crimson. Both De Candolle and Hooker concur in supposing the present plant distinct from S. virginica, though it is confounded by the authors above mentioned and also by Dr. Torrey and Mr. Elliott.
- 7. S. virginica Linn.: viscid-pubescent; stem procumbent, assurgent, branching; leaves lanceolate; lower ones on long petioles, with long ciliæ at base; flowers large, in panicles; petals with long claws, broad, bifid, crowned.
 - Hab. Penn. to Car. W. to Lake Huron. May, June. 21.—
 Flowers purple. Distinct from the next.
- 8. S. penńsylvanica Mich.: viscidly-pubescent; radical leaves somewhat cuneate; those of the stem long-linear; flowers in panicles, somewhat trichotomous; calyx long, tubular; petals slightly emarginate, subcrenate.—S. caroliniana Walt.
 - Hab. Sandy woods. Can. to Geor. May, June. 21.—Stems numerous, cespitose, 8—12 inches high. Petals bright purple.

 Wild Pink.
- ***** Cespitose. Stems almost wanting. Calyx subinflated. Peduncles 1-flowered.
- 9. S. acaulis Linn.: stems very densely cespitose, low; leaves linear, ciliate at base; peduncles solitary, short, 1-flowered; calyx campanulate; petals obcordate, crowned.

*HAB. White mountains, N. H. and throughout the whole of Arctic America, N. of lat. 54°. W. to Rocky mountains.—Nearly stemless, depressed. Flowers rose-coloured.

3. SAPONARIA. Linn.

Calyx tubular, 5-toothed, naked at base. Petals unguiculate; claw equalling the calyx. Stamens 10. Styles 2. Capsule 1-celled. Decandria. Digynia.

- 1. S. raccaria Linn.: leaves ovate-lanceolate, sessile; flowers in panicles; calyx pyramidal, 5-angled, smooth; bracts membranaccous. acute.
 - Hab. Fields. Williamstown, Mass. Dewey. July. . Flowers rose-coloured.—Probably introduced, but completely naturalized at the above locality. Field Soup-wort.
- 2. S. officinalis Linn.: leaves ovate-lanceolate, ribbed, acute or obtuse; flowers large, in a fasciculate panicle; calyx cylindrical; appendages of the petals linear.

Hab. Road sides. June—Sept. 21.—Stem 12—18 inches high.

Leaves opposite and connate. Flowers large, rose-coloured.—It is said to make a lather with water, and hence its common name. Introduced.

Soap-wort.

4. AGROSTEMMA. Linn.

Calyx tubular, 5-sided, coriaceous. Petals 5, unguiculate, not crowned; limb entire. Capsule 1-celled, opening with 5 teeth.

Decandria. Pentagynia.

A. githago Linn.: hairy; leaves opposite, linear-lanceolate; segments of the calyx much longer than the corol; flower solitary, terminal, large; petals entire, destitute of a crown.—Lychnis githago De Cand.

Hab. In corn fields. June, July. . — Stem 18—20 inches high. Flowers large, purple. Introduced. Corn Cockle.

5. SAGINA. Linn.

Calyx 4—5 parted. Petals 4—5, or none. Stamens 4—5. Capsule 4—5 valved, 1-celled, many seeded.

Tetrandria. Tetragynia.

1. S. procumbens Linn.: perennial; stems procumbent, shooth, branched; leaves linear-mucronate; petals very short.

Hab. Borders of streams. N. Y. to Car. and W. to the banks of the Columbia river. July. 21.—Stems 2—4 inches high. Peduncles solitary, larger than the leaves. Flowers small, white.

Pearl-wort.

2. S. apetala Linn.: annual; stems erect or procumbent only at base, subpubescent; leaves linear-mucronate; flowers alternate; petals very minute or none.

Hab. Sandy fields. N. J. and Penn. May, June. Q.—Stems numerous, erect, filiform. Flowers on long slender peduncles. Petals nearly obsolete, more slender and of a paler green than in the former.

Annual Pearl-wort.

6. MOLLUGO. Linn.

Calyx 5-parted. Petals none. Stamens 3-5. Styles 3. Capsule 3-valved, 3-celled, many seeded.

Triandria. Trigynia.

M. verticillata Linn.: stems decumbent, dichotomous; leaves verticillate, oboyate-lanceolate, acute; peduncles 1-flowered, verticillate.

Hab. Fields. Can. to Car. W. to the Columbia river. July—Sept. ©.—Stems prostrate. Flowers small, white, on axillary peduncles.

Indian Chickweed.

7. SPERGULA. Linn.

Calyx 5-parted. Petals 5, entire. Stamens 5—10. Styles 5. Capsule 1-celled, 6-valved, many seeded.

Decandria. Pentagynia.

1. S. arrensis Linn.: leaves whorled, with stipules at the base; panicle dichotomous; flowers decandrous; peduncles of the fruit reflexed; seeds spherical, somewhat hispid, black, with a narrow margin.

HAB. Sandy fields. Can. to Car. W. to the Columbia river.

June—Aug. .—Stem 6—12 inches high, swelling at the joints.

Leaves narrow-linear, whorled. Flowers white, in a panicle.—

According to Dr. Hooker the margin of the seed varies greatly in its breadth.—Fl. Scot.—Naturalized.

Corn Spurrey.

2. S. saginoides Linn.: stem creeping; leaves opposite, linear, smooth, awnless; peduncles solitary, very long; petals oblong, obtuse, as long as the calyx; seeds kidney-form, punctate.—S. decumbers Ell.—S. nodosa Walt.

Hab. Sandy fields. N.J. to Car. W. to N. W. Coast of America.

June. ©.—Stem 2—4 inches long, decumbent. Flowers erect, white. Resembles Sagina procumbers very much.

Pearl-wort Spurrey.

S. STELLARIA. Linn.

Calyx 5-parted. Petals 5, bifid. Stamens 10, or by abortion 3-8. Styles 3. Capsule 1-celled, 6-valved at the apex, many seeded.

Decandria. Trigynia.

1. S. media Smith: stem procumbent, with an alternate pubescent, lateral line; leaves ovate or lanceolate, very smooth; upper ones sessile; capsule deeply 6-valved, scarcely longer than the calyx; seeds subreniform, rugose.—Alsine media Linn.

- HAB. Road sides, &c. Can. and N. S. March-Nov. Q.-Stem spreading. Peduneles axillary and terminal, 1-flowered. Petals white, deeply cleft. Stamens 5-10.
- 2. S. pubera Mich.: pubescent; stem decumbent; leaves ovate-oblong, sessile, acute, ciliate; pedicels filiform dichotomal, recurved or deflexed; petals longer than the calvx.

HAB. Rocky banks. Penn. to Geor. May, June. 21.? Stem 6-12 inches high, diffuse and dichotomous. Flowers large, ax-

illary and terminal, on filiform pedicels.

3. S. longifolia Muhl.: smooth; stem erect, square, weak; leaves linear-acute, spreading, with the margins often scabrous; panicle terminal, divaricate, very long, bracteate; petals broad-obovate, 2-parted, about as long as the 3-nerved calyx .- Spergulastrum gramineum Mich. -Mieropetalum gramineum Pers.

HAB. Moist woods. N. S. and N. to lat. 64°. June. 21.—Stem 12-15 inches high. Petals white, becoming longer than the calyx.—There appears to be no just ground for the separation of the genus Micropetalum from Stellaria. It is, however, counte-

nanced by De Candolle.

4. S. lanecolata Torr.: very smooth, procumbent or ascending; leaves lanceolate, acute at each end; petals about as long as the calyx; stigmas mostly 4, or wanting.—Micropetalum lanecolatum Pers.

- AB. Alpine swamps. N. S. June. 21.—Stem 6—8 inches. Flowers solitary, axillary and terminal, on long slender peduncles. By some botanists this plant is considered identical with the former, while Dr. Hooker considers Dr. Torrey's plant as a variety of his S. borealis.
- 5. S. borealis Big.: stem spreading, angular, dichotomous; leaves oval-lanceolate; peduncles axillary, elongated, 1-flowered; petals deeply cleft, about equal to the calyx. -S. borcalis, var. Hooker.

HAB. White hills. N. H. and throughout Can. to the Arctic circle. July, Aug. 24.—Stem spreading, angular. Leaves slightly connate. Petals white, deeply cleft.

6. S. longipes Goldie: weak, very smooth, glaucous; leaves linear, subulate, spreading; peduncles terminal, dichotomously branched; bracts membranaceous; pedicels much elongated; petals broad-ovate, deeply bifid, a little longer than the obtuse and obscurely 3-nerved calyx. - Goldie. Hooker.

HAB. Woods near Lake Ontario .- Flowers large, white, in a terminal leafless panicle. A very minute description of this plant, and many interesting observations upon the Canadian species of this genus, will be found in Hooker's Fl. Bor. Amer.

9. ARENARIA. Linn.

Calyx 5-sepalled. Petals 5, entire. Stamens 10, or fewer by abortion. Styles 3. Capsule 1-celled, many seeded. Decandria. Trigynia.

* Leaves linear, with scarious stipules at base.

1. A. rubra Linn.: stem prostrate, pilose; leaves filiform, acute, ilat, somewhat fleshy, mucronate, shorter than the internodes; sepals lanceolate, somewhat obtuse, scarious on the margin; peduncles axillary, at length deflexed; seeds compressed, angular, roughish, not margined.

HAB. Sandy fields. Mass. June. Q.—Stem spreading. Flowers small, red. Common Sand-wort.

2. A. canadensis Pers.: somewhat hispid; leaves filiform, longer than the internodes; sepals lanceolate, obtuse, with the margin broad and scarious; stamens 5; pedicels at length deflexed; seeds somewhat cordate, compressed; radicle somewhat prominent.—A. rubra. var. marina Linn. Torr.—A. marina Snith. Big.

Hab. Salt marshes. Along the whole coast of North America.—Stem 3—8 inches long, procumbent, succulent. Floreers axillary, solitary, on short peduncles, reddish. Capsule subglobose, longer than the calyx. This plant has been confounded with A. marina of Smith; but the latter is characterized by the seeds having a broad membranaceous border, and is considered by De Candolle identical with A. media of Linnæus. De Candolle, who appears to have seen specimens of the above plant, considers it distinct from A. rubra, though this opinion is opposed by the authorities above cited. It varies much in the number of its stamens, being frequently di-tri and pentandrous.

Sea Sand-wort.

** Leaves linear, lanceolate, or rounded, without stipules.

3. A. squarrosa Mich.: cespitose; inferior leaves squarrose, imbricate, channelled, smooth; stem simple, few-leaved; flowers in dichotomous panicles, erect; sepals roundish-ovate, smooth; petals obovate, much longer than the calyx; capsules oval, 3-valved, exceeding the calyx; valves obtuse.—A. caroliniana Walt.

Hab. Pine barrens. N. J. to Car. May—Aug. 24.—Stem 6—8 inches high, much divided near the base. Flowers white, in a small terminal panicle. Squarrose Sand-wort.

4. A. stricta Mich.: stems numerous, erect, smooth; filiform; leaves subulate-linear, erect, subfasciculate, spreading; panicle few-flowered; sepals ovate-lanceolate, conspicuously striate, half as long as the petals.

HAB. Mountains. Can. to Car. May, June. 24.—Stems 6—12 inches high. Leaves more linear than in the preceding, and not so much crowded near the base.

5. A. glabra Mich.: very smooth; stems numerous, erect, filiform; leaves subulate-linear, flat, spreading; pedicels 1-flowered, elongated, divaricate; sepals oval, obtuse, shorter than the petals.—S. uniflora Walt.

Hab. Mountains. N. H. N. Y. to Car. June. 2f.—Stems 4—6 inches high, erect, slender. Flowers white, large.

6. A. serpyllifolia Linn.: stem dichotomous, diffuse; leaves ovate, acute, sessile, somewhat rugose, smooth, ciliate; sepals lanceolate:

acute, 3-nerved, larger than the corol; capsule ovate, 6-valved, equalling the calyx; seeds exactly reniform, rugose.

minal, solitary.

- 7. A. lateriflora Linn.: stem filiform, branched; leaves obtuse, ciliate, nerved; peduncles lateral, solitary, elongated, 1-2 flowered; one of the pedicels with 2 opposite bracts near the middle; sepals ovate, obtuse, shorter than the petals; capsule ovate, obtuse, longer than the calyx.
 - HAB. Meadows. N. S. North to Hudson's bay. June. -Stem 5-10 inches high, erect, filiform. Peduncles axillary, very slender, forked. Flowers white.
- 8. A. peploides Linn. : stem dichotomous; leaves ovate, acute, fleshy, approximate; flowers solitary, on short peduncles; sepals oblong, acutish, about as long as the corol; capsule globose, depressed, 3-valved; seeds numerous, black.

HAE. Sea coast. Mass. N. J. N. to Arctic America. June. 21. -Stem 8-12 inches high. Flowers axillary, sessile. Petals white, membranaceous, spatulate.

10. CERASTIUM. Linn.

Calyx 5-parted. Petals 5, bifid. Stamens 10. Styles 5. Capsule 1-celled, cylindrical or globose, dehiscent at the apex with 10 teeth. Decandria. Pentagynia.

1. C. rulgatum Linn. : viscidly pubescent, pale green; stems numerous, cespitose, suberect; leaves ovate, obtuse, hirsute; flowers dichotomous, subumbelled, longer than the peduncles; petals oblong, emarginate, scarcely longer than the calyx; capsule oblong, tapering, as long again as the calyx.

HAB. Fields and hills. Can. to Car. May-Aug. O .- Stem 6-10 inches high. Flowers white. Introduced.

Mouse-ear Chickweed.

2. C. riscosum Linn. : hairy and viscid, deep green; stems numerous, erect; leaves lanceolate-oblong; flowers in dichotomous umbels, shorter than their pedicels; capsule somewhat incurved, terete, as long again as the calvx.

HAB. Fields and road sides. Can. to Car. May-Aug. 24.-Stem 6-12 inches high. Leaves rather obtuse. Petals white, obovate, a little longer than the calyx.

3. C. semidecandrum Linn.: hirsute and viscid; stems numerous, erect; leaves ovate-lanceolate; flowers pentandrous, somewhat umbelled, shorter than their pedicels; petals slightly notched; capsule te-

rete, deflexed, as long again as the calyx.

HAB. Dry hills. N. S. May-Aug. O.-Perhaps only a variety of the preceding. De Candolle places the C. semidecandrum of American authors, as a variety under C. vulgatum.

4. C. arvense Linn.: stems ascending; leaves linear-lanceolate, obtuse, more or less liairy, especially at base; flowers few, terminal; peduncles deflexed, pubescent; petals twice as long as the calyx; cap-

sule oblong-cylindrical, scarcely longer than the calyx.

HAB. Fields and rocky hills. N. S. May—Aug. 21.—Root creeping. Stems 4—8 inches long, ascending, slender, somewhat cespitose. Leaves crowded at the base of the stem, short, ciliate at base. Flowers large, white, 2 or 3 on terminal pedicels. Petals deeply cleft, white, twice as long as the calyx. This is undoubtedly a native near Albany, as it would seem to be also, according to Dr. Barton, on the banks of the Schuylkill and Delaware. Fl. Phil. i. 216. Dr. Bigelow credits it to the vicinity of Boston, but thinks it merely naturalized. Field Chickweed.

5. C. tenuifolium Pursh.: pubescent-cespitose; leaves narrow-linear, longer than the internodes; flowers on long peduncles, mostly 3, from the top of each stem; petals obovate, emarginate, thrice as long as the

acute calyx .- C. dichotomum Muhl. ?

HAB. Rocky places. N. S. June. 21.—Stems numerous, erect. Flowers on long peduncles, 3 from the summit of each stem. Resembles the preceding, but has longer and narrower leaves, and longer and less deeply cleft petals. But it may, after all, be a mere variety. Sprengel considers C. pennsylvanieum of Hornemann identical with it.

6. C. pubescens Goldie: pubescent-hirsute; stem deflexed-pilose; leaves linear-lanceolate, longer than the internodes; panicle terminal, about 3—6-flowered; petals acutely emarginate, twice as long as the

calyx.

- Hab. Kingston, U. Can. Bellows' Falls, N. H. June. 21.—
 This species was first described by Mr. Goldie. Edin. Phil.
 Jour. vi. 327. I have specimens of the same plant collected at
 Bellows' Falls, by Mr. G. W. Clinton. They resemble those of
 the preceding species, but the stems are much longer and more
 slender, and are branched from below in a dichotomous manner;
 the peduncles also, are much longer, and the flowers more numerous: the sepals have a white shining and scarious margin.
- 7. C. nutans Raf.: viscid and pubescent; stems erect, straight, deeply striatc; leaves elongated, distant, lanceolate-linear; flowers subumbelled, on long petioles; petals oblong, bifid at the tip, longer than the calyx; capsule nodding, twice as long as the calyx.—C. glutinosum Nutt.—C. longe peduneulatum Muhl.

IHAB. Rocky hills. N. S. June. @.—Stems numerous, 8—12 inches high, very viscid. Lower leaves subspathulate. Flowers terminal, in a loose dichotomous panicle.

8. C. oblongifolium Torr.: cespitosc, pubescent; stems erect, terete, even; leaves lanceolate-oblong, rather acute, shorter than the joints; flowers terminal, shorter than their pedicels; petals obovate, bifid at the tip, twice the length of the calyx.—C. bracteatum Raf.?

HAB. Mountains. Mass. June. 21.—Stems 8—10 inches high.

Flowers terminal, few, in a dichotomous panicle.

55

9. C. connatum Beck: very hairy, diffuse; leaves somewhat obovate, connate; flowers in dense clusters; petals 2-cleft, a little longer than the acute calyx; capsule cylindrical, straight, twice as long as the calyx.—C. hirsutum Muhl. Ell. Torr.—C. semidecandrum Walt.

Hab. N. Y. Del. S. to Car. May, June. @.—Stem procumbent. Flowers white, in terminal clusters. I have changed the name given to this plant by the authors above quoted, in consequence of finding a foreign C. hirsutum, in De Candolle's Prodromus,

which appears to be quite distinct from this species.

ORDER XIX. ELATINE E. Lind.

Sepals 3—5, distinct, or slightly connate at the base. Petals hypogynous, alternate with the sepals. Stamens equal in number to or twice as many as the petals. Ovary 3—5-celled; styles 3—5; stigmas capitate. Capsule 3—5 celled, 3—5 valved. Seeds numerous, with a straight embryo, whose radicle is next the hilum; albumen none.

Annuals, found in marshes. Stems fistulous, rooting.

Leaves opposite.

1. CRYPTA. Nutt.

Calyx 2-leaved, inferior. Corol 2—3 petalled, closed. Style almost wanting. Stigma obtuse. Capsule: 2—3 celled, 2—3 valved; cells 4—5 seeded.

Diandria. Monygynia.

C. minima Nutt: stems prostrate, creeping and rooting; leaves cuneate-obovate, opposite, entire, obtuse, 1-nerved; flowers very minute,

axillary, sessile, alternate. - Peplis americana Pursh.

Hab. Banks of streams. Throughout the U. S. Aug. ②.?—
Stems prostrate, with assurgent branches. Leaves opposite, obovate or oval. Flowers sessile, with 2—3 stamens. Petals roundish, white.—For a very minute description of this little plant by Mr. Nuttall, see Jour. Phil. Acad. i. 117. According to Mr. Arnott, it belongs to the genus Elatine, and is a congener, and indeed very closely allied, to E. triandra. Edin. Jour. Nat. & Geog. Science, i. 430.

ORDER XX. LINEÆ. De Cand. Lind.

Sepals 3—4—5, persistent, with an imbricated æstivation. Petals equal in number to the sepals, hypogynous, unguiculate, with a twisted æstivation. Stamens as many as the petals, and alternate with them (with intermediate teeth or abortive stamens) arising from an annular torus; anthers ovate, erect. Ovary with as many (rarely fewer) cells and styles as

stamens; stigmas capitate. Capsules generally pointed with the hardened base of the styles, many-celled; each cell partially divided in two by an imperfect spurious dissepiment, and opening by two valves at the apex. Seeds solitary, in each spurious cell, compressed, pendulous. Albumen thin, fleshy; embryo straight, with the radicle next the hilum; cotyledons flat.

Herbs or small shrubs. Leaves entire, usually alternate. Flowers terminal, with the petals fugitive.

1. LINUM. Linn.

Sepals 5, persistent. Petals 5, unguiculate. Stamens 5, with the filaments united at base. Styles 5, very rarely 3. Capsule superior, subglobose, 10-valved, 10-celled. Seeds solitary, ovate, compressed. Pentandria. Pentagynia.

1. L. virginianum Linn.: stem erect, slender, smooth; radical leaves ovate and spatulate; those of the stem linear-lanceolate, alternate; panicle lax, corymbose; sepals acute; capsule globose, awnless.

Hab. Hills and fields. N. Y. to Car. July, Aug. S.—Stem 1—2 feet high, slender. Flowers small, yellow, in a dichotomous panicle. Virginian Flax.

2. L. usitatissimum Linn.: stem mostly solitary, round, smooth, simple, branched above; leaves lanceolate, alternate; flowers large, on peduncles; segments of the calyx ovate, acute; petals crenate; capsule roundish, acuminate.

Hab. Fields. June, July. O.—Flowers large, blue. Introduced.

ORDER XXI. MALVACEÆ. De Cand. Lind.

Sepals 5, very seldom 3 or 4, more or less united at the base, with a valvate estivation, often bearing external bracts forming an involucrum. Petals equal in number to the sepals, hypogynous. Stamens indefinite; filaments monadelphous, often bearing the petals on their base. Anthers 1-celled, reniform. Ovary formed by the union of several carpels round a common axis, either distinct or cohering; styles as many as the carpels, united or free; stigmas variable. Fruit capsular or berried; its carpels being either one or many-seeded, sometimes united in one, sometimes separate or separable. Sceds sometimes hairy. Albumen none, or small; embryo curved with twisted and doubled cotyledons.

Herbs, trees or shrubs. Leaves alternate, more or less divided, stipulate.

1. MALVA. Linn.

Calyx surrounded by a 3, rarely 5—6-leaved involucre.

Bracts oblong or setaceous.

1-seeded, arranged circularly.

Capsules numerous, 1-celled,

Monadelphia. Polyandria.

1. M. sylvestris Linn.: stem erect, herbaceous, branched, hairy; leaves large, roundish, with 7 somewhat acute lobes; flowers large, axillary, on short pedicels; pedicels and petioles hairy; petals obcordate, thrice as long as the calyx.

HAB. Fields. July, Aug. 24.—Stem 2—3 feet high. Flowers

3-4 together, reddish-purple, veined. Introduced.

High Mallows.

2. M. rotundifolia Linn.: stem somewhat prostrate; leaves roundish, cordate, obtusely 5—7 lobed; peduncles bent downwards, and with the petioles pubescent; flowers axillary; corol twice the length of the calyx.

HAB. Cultivated grounds. Can. to Car. W. to Miss. June—Oct. 24.—Root fusiform. Flowers small, pink, on pedicels, 2—3 together. Extensively naturalized.

Low Mullows.

2. ALTHEA. Linn.

Calyx surrounded by a 6—9 cleft involucre. Capsules numerous, 1-seeded, arranged circularly.

Monadelphia. Polyandria.

A. officinalis Linn.: leaves soft tomentose on both sides, cordate and ovate, dentate, entire or 3 lobed; peduncles axillary, many flowered, much shorter than the leaves.

Hab. Near salt marshes. Aug. Sept. 21.—Stem 2 feet high.

Flowers large, purple. Introduced.

Marsh Mallows.

3. HIBISCUS. Linn.

Calyx surrounded by an involucre which is often many-leaved. Stigmas 5. Capsule 5-celled; cells many seeded, or rarely 1-seeded. Monadelphia. Polyandria.

1. H. rirginicus Linn.: leaves acuminate, unequally toothed, subvillose; lower ones undivided, cordate; upper ones ovate-cordate, 3-lobed; pedicels longer than the petiole; flowers cernuous; pistils nodding; capsule hispid.—H. clypeatus Walt.

Hab. Salt marshes. N. Y. to Car. Aug. 21.—Stem 3 feet high. Flowers in paniculate racemes, small, rose coloured. In-

volucre 8-9 leaved, tomentose.

2. II. moscheutos Linn.: leaves ovate, acuminate, serrate, tomentose beneath; petioles bearing the peduncles; calyx tomentose; capsule smooth.—II. palustris Walt.

- HAB. Swamps and salt marshes. N. Y. to Car. Aug. 24.—
 Stem 4—6 feet high. Flowers large, white with a purple centre.
- 3. H. palustris Linn.: leaves ovate, toothed, somewhat 3-lobed, white-tomentose beneath; pedicels axillary, distinct from the petioles, auriculate above the middle.

HAB. Salt marshes. Can to Car. Aug. 21.—Stem 3—4 feet high. Flowers purple, smaller than the preceding.

- 4. H. militaris Willd.: leaves 3-lobed, hastate, acuminate, serrate, smooth; pedicels articulate in the middle; corol subcampanulate; capsule ovate, acuminate, smooth; seeds silky.—H. virginicus Walt.—H. hastatus Mich.
 - Hab. Banks of streams. Penn. to Car. W. to Arkansas. Aug. 21.—Stem 3—4 feet high. Flowers large, purple, axillary, solitary.
- 5. H. trionum Linn.: leaves toothed; lower ones scarcely divided; upper ones 3-parted; lobes lanceolate, middle one very long; calyx inflated, membranaceous, nerved.

Hab. Apparently naturalized near Albany, N. Y. July. . Stem 2 feet high. Flowers yellowish-white, with the lower part purple. Flower-of-an-Hour.

4. SIDA. Linn.

Calyx naked, 5 cleft, often angled. Style many cleft at the top. Capsules numerous, arranged circularly, 1-celled, 1—3 seeded.

Monadelphia. Polyandria.

- 1. S. spinosa Linn.: leaves ovate-lanceolate, toothed, with the tubercles at the base spiny; pedicels axillary, solitary, shorter than the stipules and petioles; capsules 5, bi-rostrate.
- 2. S. napæa Willd.: leaves palmately 5-lobed, smooth; lobes oblong, acuminate, toothed; peduncles many-flowered; capsules 10, awnless, acuminate.—Napæa læris Linn.

HAB. Rocky places. Penn. to Virg.; rare, Pursh. Stem 3-4 feet high. Flowers small, white.

- 3. S. dioica Willd.: leaves palmately 7-lobed, rough; lobes lanceolate, incisely toothed; peduncles many-flowered, bracteate, subcorymbed; flowers diocious; capsules 10, awnless.—Napαa dioica and N. scabra Linn.
 - Hab. Stony ground. N. S. Torr. Oct. 24.—Stem 4—5 feet high. Flowers small, white.
- 4. S. abutilon Linn.: leaves roundish-cordate, acuminate, toothed, tomentose; peduncles shorter than the petioles; capsules 15, truncate, birostrate, hairy.

HAB. Waste ground. N. S. July, Aug. O .- Stem 3-5 feet high. Leaves large. Flowers orange. Introduced.

Indian Mallows.

ORDER XXII. TILIACEÆ. De Cand.

Sepals 4-5, with the estivation valvate and rarely imbricate. Petals 4-5, entire, usually with a little pit at their base, rarely wanting. Stamens generally indefinite, hypogynous, distinct; anthers 2-celled, dehiscing longtiudinally. Torus with 4-5 glands at the base of the petals. Ovary single, composed of from 4-10 carpels; style 1; stigmas as many as the carpels. Fruit dry, of several cells. Seeds numerous; embryo erect in the axis of fleshy albumen, with flat foliaceous cotyledons.

Trees or shrubs, with simple stipulate alternate leaves and axillary flowers.

TILIA. Linn. 1.

Calyx 5-parted, deciduous. Petals 5, naked, or with a small scale within. Stamens many; filaments free, or somewhat in sets. Ovary globose, villous, 5-celled; cells 2-seeded, (Nutt.) coriaceous, by abortion 1-celled, 1-2 seeded.

Polyandria. Monogynia.

1. T. glabra Vent.: leaves deeply cordate, abruptly acuminate, acutely serrate, subcoriaceous, smooth; flowers in cymes; petals truncate at the apex, crenate; style as long as the petals; fruit ovate,

somewhat ribbed.—T. americana Linn. Mich. f. T. canadensis Mich.
Hab. Woods. Can. to Car. W. to Miss. June. A large tree
with yellowish white flowers. The wood is white and soft, and much used by cabinet and coach makers.

Linn, or Linden. Bass Wood.

2. T. laxiflora Mich.: leaves cordate, gradually acuminate, serrate, membranaceous, smooth; flowers in loose panicles; petals emarginate; styles longer than the petals; fruit globose.

HAB. Near the sea coast. Mar. to Geor. May. 21 .- A very distinct species, though generally confounded with the former.

3. T. pubeseens Ait.: leaves truncate at the base, subcordate, oblique, denticulate-serrate, pubescent beneath; petals emarginate; styles longer than the petals; fruit globose, smooth. - T. americana Walt.

HAB. Banks of streams. N. S. to Geor. June. b.—A large tree. Flowers white, in axillary cymes.

ORDER XXIII. HYPERICINEÆ. De Cand. Lind.

Sepals 4-5, distinct or cohering, persistent, unequal, with glandular dots. Petals 4-5, hypogynous, with a twisted æstivation and oblique veins, often having black dots. Stamens indefinite, hypogynous, in three or more parcels; anthers versatile. Ovary single, superior; styles several, rarely connate; stigmas simple, occasionally capitate. Fruit a capsule or berry, of many valves and many cells; the edges of the former being curved inwards. Seeds minute, indefinite, usually tapering; embryo straight; albumen none; radicle next to the hilum, inferior.

Herbs or shrubs, with a resinous juice. Leaves opposite, entire, dotted, occasionally alternate and crenate. Flowers generally yellow.

1. HYPERICUM. Linn.

Capsule membranaceous. Styles 3—5. Stamens many, polydelphous at base, rarely indefinite. Petals 5. Sepals 5, unequal, more or less united at base.

Polyandria. Di-Pentagynia.

* Stamens numerous. Styles 5. Flowers mostly terminal, large, yellow.

1. H. aseyroides Willd.: smooth; stem simple, square, winged at the base; leaves sessile, oblong-lanceolate, acute; calyx ovate-lanceolate; styles free, as long as the stamens.—H. macrocarpum Mich.

HAB. River banks. Can. and N. S. July. 21.—Stem 2 feet high. Flowers and leaves large. Capsules nearly as large as nut-

megs.

2. H. Lalmianum Willd.: frutescent, much branched; branches square, leaves linear-lanceolate; flowers few, in a terminal corymb; calyx lanceolate, somewhat obtuse.

IIAB. Wet rocks. N. Y. to Virg. July, Aug. 5.—Stem 3—5 feet high. Flowers large. This species has been found near Niagara Falls by Dr. Asa Gray.

- ** Stamens numerous, somewhat definite (9-15-18) polyadelphous.

 Styles 3. Flowers reddish.
- 3. H. virginicum Linn.: stem suffruticose, terete; leaves oblong, obtuse, subclasping, punctate, very obtuse; flowers peduncled, axillary and terminal; calyx lanceolate; stamens 9—12, slightly united at base.—Elodea campanulata Pursh.

HAE. Bogs and meadows. Can. to Car. July—Sept. 2.—
Stem 2 feet high. Leares opposite, dotted, glaucous beneath.
Flowers few, in a panicle, yellowish-red, middle sized.

- *** Stamens numerous, indefinite. Styles mostly 3. Flowers yellow.
- 4. H. angulosum Mich.: stem herbaceous, square, erect; leaves distant, elongated, ovate, subclasping, sinuate on the margin, acute, not punctate; flowers axillary, solitary, in a dichotomous paniele; calyx lanceolate, acute, somewhat keeled.—H. denticulatum Walt.
 - HAB. Cedar swamps. N. J. to Car. June, July. 24.—Stem 12—18 inches high, branched towards the summit. Flowers scattered in the panicle and alternate, orange-coloured. Styles 3, often united.
- 5. H. cistifolium Lam.: stem angular; leaves ovate-oblong, somewhat acute, black-punctate beneath, subclasping, revolute on the margin: flowers in dichotomous corymbs; calyx ovate; styles united.—
 H. adpressum Bart.?

HAB. Western part of N. Y. Dr. Asa Gray. July. 21.

6. H. punctatum Linn.: stem terete, black-punctate; leaves ovate-lanceolate, obtuse, subclasping; flowers in dense corymbs; calyx lanceolate, acute.—H. corymbosum Willd. Pursh.—H. maculatum Walt.

HAB. Shady woods. Can. to Car. June. 21.—Stem 2 feethigh. Flowers in a compact paniele or corymb. Styles 3, longer than the stamens. Whole plant, except the filaments and styles. spotted with black dots.

7. H. perforatum Linn.: stem ancipital; leaves obtuse, ovate-elliptic, and with the lanceolate calyx pellucid-punctate; flowers panicled; anthers with black punctures; styles diverging.

- Hab. Fields. N. S. June—Aug. 21.—Stem a foot high. branched. Flowers yellow. A pernicious weed, producing, according to Dr. Darlington, troublesome sores upon horses and horned cattle, where it comes in contact with them. It would seem that the dcw which collects on the plant, becomes active in this way.—Fl. Cestrica. Introduced.

 St. John's Wort.
- 8. H. parviflorum Willd.: stem erect, much branched, smooth, square; leaves ovate, subcordate, obtuse, sessile, obscurely 5-nerved, pellucid-punctate; flowers in a dichotomous corymb; calyx linear-lanceolate, longer than the petals.—H. quinquenervium Walt. Mich.

 Hab. Overflowed grounds. Throughout Can. and the U. S.

Hab. Overflowed grounds. Throughout Can. and the U. S. June—Aug. 24.—Stem 6—12 inches high. Flowers very small, yellow, solitary in the divisions of the stems.

- 9. H. canadense Linn.: stem erect and straight, 4-winged; leaves linear, attenuate at the base, rather obtuse; panicle elongated, dichotomous; calyx lanceolate; styles very short; capsule long, conical, coloured.
 - Hab. Gravelly soil. Can. to Car. June—Aug. @.—Stem 6—12 inches high. Flowers small, yellow. Capsule much longer than the calyx and of a reddish colour, by which, together with its linear leaves, it can be readily distinguished from the preceding.
- 10. H. sarothra Mich.: erect, much branched above; branches setaceous; leaves minute, subulate, appressed; flowers terminal, subsoli-

tary; stamens 5-10; capsules oblong, 1-celled.-H. nudicaule Walt. -Sarothra gentianoides Willd.

HAB. Sandy fields. N. E. to Car. Pursh. June-Aug. 21 .-Stem 3-6 inches high. Leaves and flowers minute. Stamens very variable in number.

11. H. prolificum Linn.: stem shrubby, terete; branches angled: leaves linear-lanceolate, revolute on the margin, pellucid-punctate; corymbs axillary and terminal, few-flowered; calyx ovate-lanceolate; stamens very numerous.

Hab. N. Y. to S. Car. July. D.—Shrub 2—3 feet high, with much compressed branches. Leaves 2 inches long. Peduncles generally 3-flowered, the intermediate one nearly sessile.

12. H. galioides Linn.: stem terete, straight, somewhat shrubby; branches square; leaves linear-sessile, revolute on the margin, acute, punctate; panieles terminal, dichotomous and divaricate; calyx linear, at length reflexed; styles often united.

HAB. Sandy moist places. N. J. to Car. July. 21.-Stem 2 feet high. Leaves fasciculate. - Scarcely differing from H. fasci-

culatum of Michaux.

2. ASCYRUM. Linn.

Calyx 4-sepalled; 2 outer sepals smaller. Petals 4. Stamens many, scarcely united at base. Styles 1-3.

Polyandria. Di-Pentagynia.

1. A. crux-andrea Linn.: stems numerous, suffruticose, terete, with erect branches; leaves ovate-linear, obtuse; inner sepals suborbicular; pedicels with 2 bracts; flowers sessile; styles 1-2.-A. multicaule Mich.

HAB. Sandy fields. N. J. to Car. July. 21.—Stems 1-2 feet high. Flowers solitary and axillary, nearly sessile, pale yellow. Mr. Elliott remarks that this plant varies so much in the size and number of its leaves, in its peduncles, and in the number of its styles, that it merits culture to determine whether more than one species are not included under this name. St. Peter's Wort.

2. A. stans Mich.: stem fruticose, winged, straight; leaves ovateelliptical, obtuse, glaucous; inner sepals cordate, orbicular; stamens united at the base; styles 2 .- A. hypericoides Pursh, not of Linn.

HAB. Overflowed sandy soil. N. J. to Car, July, Aug. 21.-Stem 1-2 feet high. Flowers larger than the last, yellow.

ORDER XXIV. ACERINEÆ. De Cand. Lind.

Calyx 5, or rarely 4-9-parted, with an imbricate æstivation. Petals equal in number to the lobes of the calyx, with which they alternate, rarely wanting. Stamens definite, usually 8, rarely 5 or 12; anthers oblong. Torus discoid.

Ovary 2-lobed, 2-celled; style 1; stigmas 2. Fruit of two indehiscent winged carpels (samara,) each 1-celled, with 1 or 2 seeds. Seeds erect; albumen none; embryo curved or convolute, with foliaceous wrinkled cotyledons and an inferior radicle.

Trees, with opposite, simple, rarely pinnate leaves. Flowers often polygamous, sometimes apetalous.

1. ACER. Linn.

Flowers mostly polygamous. Calyx 5-lobed, sometimes 5-parted. Stamens rarely 5, often 7-9. Samaræ 2, winged, united at base, by abortion 1-seeded.

Octandria. Monogynia.

* Flowers in corymbs or faseicles.

1. A. rubrum Linn.: leaves generally 5-lobed, cordate at the base, unequally and incisely toothed, glaucous beneath; the sinuses acute; flowers aggregated in about fives, on rather long pedicels; germs glabrous.

Hab. Moist woods. Can. to Flor. April.—A tree from 20—50 feet high. Flowers 5-petalled, pentandrous. Red Maple.

2. A. eriocarpum Mich.: leaves palmately 5-lobed, truncate at the base, smooth and whitish-glaucous beneath; sinuses obtuse; lobes acuminate, incisely toothed; flowers aggregated, on short pedicels; germs tomentose.—A. dasyearpum Willd.

HAB. Banks of streams. Can. to Geor. April, May.—A large tree. Flowers greenish, pentandrous, apetalous.

White or

White or Soft Maple.

- 3. A. barbatum Mich.: leaves ovate-cordate, with 3 short lobes, unequally serrate, glaucous beneath and pubescent on the nerves; corymbs sessilo; peduncles hairy; those of the sterile flowers branched; of the fertile simple; calyx bearded within; fruit smooth; wings erect.—A. carolinianum Walt.
 - Hab. Cedar swamps. N. S. to Car. April.—A small tree.

 Leaves small. Flowers pale green. Calyx densely bearded within.
- 4. A. saccharinum Linn.: leaves palmately 5-lobed, subcordate at base, petioled, glaucous beneath; lobes acuminate; peduncles corymbose, loose, nodding, hairy; fruit glabrous; wings divergent.

Hab. In woods. *Can. to Geor. W. to Miss. April.—A large tree. Flowers yellowish, on long filiform peduncles. Petioles smooth.—Valuable for its timber and for the sugar obtained from its sap.

Sugar Maple.

5. A. nigrum Mich.: leaves palmately 5-lobed, cordate, with the sinus closed, pubescent beneath; lobes divaricate, sinuate-dentate;

flowers on long slender peduncles, corymbed; fruit glabrous, turgid at base; wings diverging.

HAB. Mountainous situations. Ver. to Car. April.-A large tree. Flowers yellowish. Petioles pubescent.

Black Sugar Maple.

** Flowers in racemes.

6. A. striatum Mich.: leaves with 3 acuminate lobes, rounded at the base, acutely dentate, smooth; racemes simple pendulous; petals oval; fruit smooth; wings somewhat diverging.—A. pennsylvanicum Linn.

HAB. Shady rocks. N. S. May. 5.—Shrub 10 or 12 feet

high; trunk beautifully striate. Leaves rarely undivided. Flowers greenish-yellow, 10-12 in a raceme.

Striped Maple. Moose Wood.

7. A. spicatum Linn.: leaves small, 3-5-lobed, acute, dentate, cordate, pubescent beneath; racemes spikeform, erect; petals linear; fruit smooth; wings somewhat diverging .- A. montanum Ait. Pursh.

HAB. On mountains. Can. to Geor. May. - Shrub 8-10 feet high. Flowers greenish, small.

2. NEGUNDO. De Cand.

Flowers dioecious. Calyx minute, unequally 4-5-toothed. Petals none. Anthers 4-5, linear, sessile.

Octandria. Monogynia.

N. fraxinifolium Nutt.: leaves ternate and pinnate; leafets unequally and coarsely dentate; odd one often 3-lobed; flowers in simple pendulous racemes. - Accr negundo Linn. Mich.

HAB. River banks. Penn. to Geor. W. to Rocky Moun. April.

-A large tree with greenish flowers.

Ash-leaved Maple. Box Elder.

ORDER XXV. HIPPOCASTANEÆ. De Cand. Lind.

Calyx campanulate, 5-lobed. Petals 5, or 4 by the abortion of one of them, unequal, hypogynous. Stamens 7-8, distinct, unequal, inserted upon a hypogynous disk; anthers somewhat incumbent. Ovary roundish, 3-cornered, 3-celled; style 1, filiform, conical, acute; ovules 2 in each cell. Fruit coriaceous, 1-2 or 3-valved, 1-2 or 3-celled, 1, 2 or 3-seeded. Seeds large, roundish, with a smooth shining coat, and a broad pale hilum; albumen none; embryo curved, inverted, with fleshy, very thick, gibbous, cohering cotyledons, germinating under ground; plumula unusually large, 2-leaved; radicle conical, curved, turned towards the hilum.

Trees or shrubs. Leaves opposite, compound. Flowers in terminal racemes.

1. ÆSCULUS. Linn.

Calyx campanulate. Petals 4—5, expanded; limb ovate. Filaments recurved backward. Capsules echinate.

Heptandria. Monogynia.

E. glabra Willd.: leaves quinate, very smooth; leafets ovate acuminate; corol 4-petalled, spreading, with the claws as long as the calyx; stamens longer than the corol; capsules echinate.—E. echinata Muhl.?—Pavia Ohiensis Mich. f.

HAB. Woods. Penn. W. to Miss. May.—A large shrub or small tree. Flowers yellowish-white, in terminal racemose pani-

ORDER XXVI. AMPELIDEÆ. De Cand.

Calyx small, nearly entire. Petals 4 or 5, sometimes cohering above, and calyptriform, with a valvate æstivation. Stamens equal in number to the petals, inserted upon the disk, sometimes sterile by abortion; filaments distinct, or slightly cohering at the base; anthers ovate, versatile; ovary superior, 2-celled; style 1, very short; stigma simple; ovules erect, definite. Berry globose, pulpy, 2- (or often by abortion 1-) celled. Seeds 4 or 5, or fewer by abortion, bony, erect; albumen hard; embryo erect, about one half the length of the albumen; radicle slender; cotyledons lanceolate.

Climbing shrubs with tumid separable joints. Leaves simple or compound.

1. AMPELOPSIS. Mich.

Calyx nearly entire. Petals 5. Style 1. Stigma capitate. Ovary not immersed in the disk, 2—4-seeded.

Pentandria. Monogynia.

1. A. cordata Mich.: stem climbing, with slender branches; leaves cordate, acuminate, toothed and angular; nerves beneath pubescent; racemes dichotomous, few-flowered.—Cissus ampelopsis Pers. Pursh.

Hab. Banks of streams. Penn. to Car. W. to Arkansa. June, July. b.—Leaves cordate, often straight at base as if truncate. Panicles opposite the leaves. Berries pale red.

2. A. hederacca Mich.: stem climbing and rooting; leaves digitate, by fives, on long petioles, glabrous; leafets connected at base, lance-

olate, acuminate, dentate towards the apex; panicle compound, dichotomous, opposite the leaves; nectary none.—Cissus hederacea Pers. Vitis hederacea Willd.

Hab. Woods. Penn. to Car. W. to Arkansa. June, July. 5.
—Flowers green. Berries dark blue. Common Creeper.

3. A. hirsuta Muhl.: leaves pubescent on both sides; leafets ovate, acuminate, coarsely toothed.—Cissus hederacea, var. hirsuta Pursh.

HAB. Alleghany mountains. Pursh. Still a doubtful species.

2. VITIS. Linn.

Calyx somewhat 5-toothed. Petals 5, cohering at their apex, deciduous. Stamens 5. Style none. Berry 2-celled, 4-seeded; cells and seeds often abortive.

Pentandria. Monogynia.

1. V. labrusca Linn.: leaves very large, broad-cordate, sub-3-lobed, acutely toothed, glabrous above, and with the peduncles tomentose beneath; racemes small, panicled; berries large.

HAB. Woods. Can. to Flor. June, July. 5.—Stem climbing to a great height. Flowers greenish. Berries dark purple.—Undergoes great changes by cultivation. Fox Grape.

- 2. V. astivalis Mich.: stem long and slender; leaves broad-cordate, 3—5-lobed, younger ones ferruginous-tomentose beneath, when old nearly smooth; sinuses rounded; racemes opposite the leaves, rather crowded, oblong; berries small.—V. intermedia Muhl.
 - b. sinuata Pursh: leaves sinuate-palmate, coarsely dentate; sinuses rhomboidal.
 - Hab. Woods. On banks of streams. N.Y. to Car. W. to Miss. June. b.—Berries deep blue or purple; ripen in August.

Summer Grape.

- 3. V. vulpina Linn.: leaves cordate, abruptly acuminate, incisely toothed, smooth on both sides; racemes loose, many flowered; berries small.—V. cordifolia Mich. Pursh.
 - HAB. River banks. Can. to Flor. b.—Berries amber-coloured; ripen in November, and have a tart taste. Winter Grape.
- 4. V. riparia Mich.: leaves cordate, unequally and incisely toothed; shortly 3-lobed, pubescent on the margin, nerves and petiole.—V. odoratissima Donn. Cat.
 - Hab. Gravelly shores of rivers. Penn. to Car. May—July. b.
 —" Flowers of an exquisitely fine smell, resembling Resedu odorata." Pursh.

ORDER XXVII. GERANIACEÆ. De Cand. Lind.

Sepals 5, persistent, more or less unequal, with an imbricated astivation; 1 sometimes saccate or spurred at the base.

Petals 5, (or by abortion 4, rarely none,) unguiculate. Stamens usually monadelphous, hypogynous, twice or thrice as many as the petals. Ovary composed of 5 pieces, placed round an elevated axis, each 1-celled, 1-seeded; ovules pendulous; styles 5, cohering round the axis. Fruit formed of 5 carpels cohering round the axis, having a membranous pericarp and terminated by an indurated style, which finally twists and carries the pericarp along with it. Seeds solitary, pendulous; albumen none. Embryo curved; radicle pointing to the base of the cell; cotyledons foliaceous, convolute and plaited.

Herbs or shrubs. Stems tumid and separate at the joints. Leaves either opposite or alternate.

1. GERANIUM. Linn.

Sepals 5, equal. Petals 5, equal. Stamens 10; alternate fertile ones larger, and with nectariferous scales at the base. Carpels with long awns, at length separating elastically from the summit to the base; awns smooth internally.

Monadelphia. Decandria.

* Perennial. Peduncles 2-flowered.

1. G. maculatum Linn.: stem somewhat angular, erect, dichotomous, retrorsely pubescent; leaves 3—5-parted, incised; radical ones on long petioles; upper ones opposite, sessile; petals entire; filaments scarcely ciliate at the base.

Hab. Can. to Car. W. to Miss. June. 21.—Stem 8—15 inches high. Leaves hairy. Flowers large, purple. The root is very astringent and is useful for medicinal purposes.—Big. Mcd. Bot. i. 19. Barton's Collections.

Spotted Geranium. Cranc's-bill.

** Annual. Peduncles 2-flowered.

2. G. pusillum Linn.: leaves subreniform, 7-lobed; lobes 3-cleft; peduncles short, 2-flowered; petals emarginate, scarcely longer than the awnless calyx; carpels keeled, pubescent; seeds smooth.—G. malvafolium Lam.

HAB. Penn. May. . Muhl.—Is not Muhlenberg's G. pusillum the next species?

3. G. dissectum Linn.: leaves 5-parted; lobes opposite, petiolate 3-cleft, linear; peduncles short, 2-flowered; petals emarginate, rather shorter than the awned calyx; carpels hairy, not rugose; seeds reticulate.

HAB. Fields. N. S. July. . —Stem 12 inches high, pubescent. Flowers small, pale red. Wood Geranium.

4. G. columbinum Linn.: leaves 5-parted; lobes deeply cleft into linear, acute, segments; peduncles very long, 2-flowered; petals entire, as long as the awned calyx; carpels glabrous, not rugose; seeds dotted.

5. G. carolinianum Linn.: diffuse, pubescent; leaves 5-lobed beyond the middle; lobes incised, 3—5-cleft; peduncles crowded towards the top; petals notched, as long as the awned calyx; carpels hairy; seeds smooth.

Hab. Hills. From Arctic Amer. to Geor. W. to Miss. May, June. Q.—Stem 12—18 inches long, branched. Flowers small,

white.

6. G. robertianum Linn.: leaves ternate or quinate; leafets somewhat pinnatifid; segments mucronate; peduncles long, 2-flowered; calyx angular, hairy, with longish awns, shorter than the entire petals; carpels small, wrinkled; seeds smooth.

HAB. Rocky places. Can. to Virg. June-Sept. . - Stem

long. Flowers rather small, purple.-Plant very fetid.

Herb Robert.

ORDER XXVIII. BALSAMINEÆ. De Cand. Lind.

Sepals 5, irregular, deciduous, the two inner and upper of which are connate, the lower spurred. Petals 4, hypygynous, united in pairs, so that apparently there are only 2 petals; the fifth wanting. Stamens 5, hypogynous; filaments subulate; anthers 2-celled, bursting lengthwise. Ovary single, 5-celled; stigma sessile, more or less 5-lobed. Fruit capsular, with 5 elastic valves and 5 cells. Seeds numerous, suspended; albumen none; embryo straight, with a superior radicle and plano-convex cotyledons.

Succulent herbs. Leaves simple, opposite or alternate, without stipules. Peduncles axillary.

1. IMPATIENS. Linn.

Sepals 5, the lower one spurred. Corol 4 petalled, irregular; the two inner petals unequally bilobed. Stigmas 5, united. Capsule prismatic-terete, elongated, 5-valved, opening elastically. Pentandria. Monogynia.

1. I. pallida Nut.: peduncles solitary, 3—4-flowered; leaves rhombic-ovate, sub-acute, mucronate-dentate; calcarate petal dilated, shorter than the rest; spur recurved, very short; flowers sparingly punctate.—I. noli-tangere Pursh.—I. aurea Muhl.

IIAB. Damp grounds. Can. to Car. W. to Miss. Aug. Q.—
Stem 2 feet high, much branched. Flowers pale yellow, larger than the next. Touch-me-not. Snap-weed. than the next.

2. I. fulva Nutt.: peduncles solitary, 2-4-flowered; leaves rhombicovate, obtuse, mucronate-dentate; calcarate petal longer than the rest; spur emarginate, resupinate; flowers with crowded spots .-I. biflora Pursh .- I. noli-tangere, var. Mich .- I. maculata Muhl.

HAB. Wet grounds. Can. to Car. Aug. . - Flowers deep yellow, spotted, smaller and less numerous than in the former.

ORDER XXIX. OXALIDEÆ. De Cand. Lind.

Sepals 5, sometimes slightly cohering at the base, persistent, equal. Petals 5, hypogynous, equal, unguiculate, with a spirally twisted æstivation. Stamens 10, usually more or less monadelphous, those opposite the petals forming an inner series and longer than the others; anthers 2-celled, innate. Ovary 5-angled, 5-celled; styles 5, filiform; stigmas capitate or somewhat bifid. Fruit capsular, membranous, with 5 cells, and from 5 to 10 valves. Seeds few, enclosed within a fleshy integument, which bursts elastically. Albumen between cartilaginous and fleshy; embryo straight, as long as the albumen, with a long radicle pointing to the hilum, and foliaceous cotyledons.

Herbs, undershrubs or trees. Leaves alternate, mostly compound.

1. OXALIS. Linn.

Sepals 5, free or united at base. Petals 5. Stamens 10; filaments monadelphous at base, 5 outer ones shorter. Styles 5. Capsule pentangular, oblong or cylindric.

Decandria. Pentagynia.

* Stemless.

1. O. acetosella Linn.: stemless; root dentate, creeping; scape 1flowered, longer than the leaves, with two small bracts above the middle; leaves ternate, dilated-obcordate, pilose; petals oval, obtuse; styles as long as the inner stamens.

HAB. Mountain woods. Can. N. Y. and Penn. June. 24.—
Scape 3—4 inches long. Flowers large, white, with red veins.
Petals slightly emarginate.—This is the Shamrock of the Irish.

Common Wood Sorrel.

2. O. riolacea Linn.: stemless; root squamous; scape unbelliferous, 3-9-flowered; flowers nodding; leaves ternate, obcordate, smooth; styles shorter than the outer stamens.

HAB. Rocky woods. N. Y. to Car. W. to Miss. May, June. 24.—Scape 4—6 inches high. Flowers violet, umbelled, with the petals obovate and sometimes slightly emarginate.

** Caulescent.

3. O. corniculata Linn. : pubescent; stem rooting, decumbent, branched; umbels shorter than the petioles; leaves ternate, obcordate; petals obovate, emarginate; styles as long as the inner stamens.—O. corniculata, var. Mich.

HAB. Woods. Can. to Car. May-Aug. 21.-Stem 6-10 inches long. Flowers small, yellow. It is distinguished chiefly by its habit.

4. O. stricta Linn.: hairy; stem erect, sometimes procumbent, branched; umbels about as long as the leaves; leaves ternate, obcordate; petals obovate, entire; styles as long as the inner stamens.

HAB. Sandy fields. Can. to Car. W. to Miss. May-Aug. 24.—Stem 4—10 inches high. Flowers small, yellow, 4—6 in an umbel. Upright Wood Sorrel.

ORDER XXX. ZANTHOXYLEÆ. Lind.

Flowers diclinous, regular. Calyx 3-4-5-divided, with an imbricate æstivation. Petals equal in number (rarely none) to the sepals; æstivation usually twisted-convolute. Stamens as many or twice as many as the petals. Ovaries as many (or fewer) as petals, either altogether combined, or more or less distinct; ovales 2 in each cell, or rarely 4; styles more or less combined. Fruit either baccate or membranous, of 2-5 cells, or of several drupes or 2-valved capsules, of which the sarcocarp is fleshy and partly separable from the endocarp. Seeds solitary or in pairs; embryo lying within fleshy albumen; radicle superior; cotyledons ovate, flat.

Trees or shrubs. Leaves without stipules, alternate or opposite, with pellucid dots.

1. ZANTHOXYLUM. Linn.

Dioecious. Calyx 3-9-lobed, often 4-5-parted. Petals as many as the lobes of the calyx, rarely none. Stamens and carpels as many as the lobes of the calyx, 1-3-seeded.

Dioecia. Pentandria.

Z. fraxineum Willd .: prickly; leaves pinnate; leafets in 4-5 pairs, ovate, obsoletely serrate, equal at base; petioles terete, unarmed; prickles stipular; umbels axillary.-Z. ramiflorum Mich.-Z. clara-herculis Linn. Ell.

Hab. Rocky woods. Can. to Car. W. to Ken. April. 5.—
Shrub 3—5 feet high, covered with sharp strong prickles. Leaves
pinnate, sometimes prickly on the back. Flowers in umbels,
small, greenish—The bark of this shrub is pungent, and is employed medicinally.—Big. Med. Bot. iii. 156. Prickly Ash.

2. PTELEA. Linn.

Calyx small, 4—5-parted. Petals 4—5, spreading. Stamens alternating with the petals. Torus tumid, pentagonal. Ovary 1. Style short. Stigmas 2. Samaræ membranaceous, margined, 2-celled; cells 2—or by abortion 1-seeded. Tetandria. Monogynia.

Pt. trifoliata Linn.: leaves on long petioles, ternate; leafets sessile, ovate, acuminate, odd one much attenuated at base; flowers in panicles, polygamous, often tetandrous.

Hab. Moist woods. Can. to Geor. W. to Miss. June. 5.

—Shrub 6-10 feet high. Flowers greenish-white, small, in corymbose clusters.

Shrubby Trefoil.

SUBCLASS II. CALYCIFLORÆ. De Cand.

Calyx with the sepals more or less united at base, (gamo-sepalous, De Cand.—monophyllous, Linn.) Petals and stamens inserted into the calyx.

ORDER XXXI. CELASTRINEÆ. De Cand. Lind.

Sepals 4 or 5, imbricated, inserted into the margin of a large expanded torus. Petals 4—5, with a broad base; æstivation imbricated. Stamens alternate with the petals, inserted into the disk, either at the margin or within it; anthers innate. Ovary superior, free, surrounded by the somewhat fleshy disk, with 2, 3 or 4 cells; cells 1, or many-seeded; style 1 or none; stigma 2—4-cleft. Fruit superior; either a 3 or 4-celled capsule, with 3 or 4 septiferous valves; or a dry drupe with a 1 or 2-celled nut, the cells of which are one or many-seeded. Seeds ascending; albumen fleshy; embryo straight; cotyledons flat and thick.

Shrubs with simple alternate or opposite leaves. Flowers in axillary cymes.

1. EVONYMUS. Linn.

Calyx 4-6-lobed, flat, covered at base by a peltate disk. Petals 4-6, spreading, inserted into the disk. Stamens 4-6,

alternating with the petals. Style 1. Capsule 3—5-celled, 3—5-angled; cells 1—4-seeded. Pentandria. Monogynia.

1. E. americanus Linn.: branches opposite, smooth, square; leaves opposite, subsessile, elliptic-lanceolate, smooth, acute, serrate; peduncles mostly 3-flowered, terete; calyx small, with acute segments; corol 5-petalled; fruit roughened, warty.

Hab. Shady woods. N. Y. to Car. June. 5.—Shrub 4—6 feet high, with opposite branches. Flowers reddish-yellow. Fruit scarlet. Burning Bush. Spindle Tree.

2. E. atropurpureus Jacq.: stem with smooth, opposite, square branches; leaves petiolate, oblong-lanceolate, acuminate, serrate, pubescent beneath; peduncles divaricate, many-flowered; flowers 4-cleft; fruit smooth.

Hab. Shady woods. N. Y. to Car. W. to Miss. June. 5.—Shrub 4—8 feet high. Flowers dark-purple. Fruit bright red.

3. E. obovatus Nutt.: stem prostrate, rooting, nearly simple; surculi erect, obtusely quadrangular, with 4 elevated lines; leaves broadovate, obtuse, acute at base, subsessile, acutely serrulate; peduncles 3-flowered; petals 4 and 5, roundish.

HAB. Fir swamps. Penn. June. h .- Shrub a foot high. Flow-

ers green, with a purple tinge.

2. CELASTRUS. Linn.

Calyx minute, 5-lobed. Petals 5, unguiculate. Stamens 5. Ovary small, with 10 striæ, immersed in the disk. Style 1. Stigmas 2—3. Capsule 2—3-valved; valves septiferous in the centre. Seed 1, covered with a large fleshy aril.

Pentandria. Monogynia.

C. scandens Linn.: stem climbing, unarmed; leaves petioled, oval, acuminate, serrate; stipules minute; racemes terminal.

Hab. Rocky woods. Can. to Virg. May, June. 5.—A woody vine or low shrub. Leaves alternate. Flowers greenish-yellow, in small terminal racemes. Fruit scarlet. Climbing Staff Tree.

ORDER XXXII. STAPHYLEACEÆ. Lind.

Sepals 5, connected at base, coloured, with an imbricated astivation. Petals 5, alternate, with an imbricated astivation. Stamens 5, alternate with the petals, perigynous. Disk large, urceolate. Ovary 2—3-celled, superior; ovules erect; styles 2—3, cohering at the base. Fruit membranous or fleshy, indehiscent or opening internally, partly abortive. Seeds ascending, roundish, with a long testa; hilum large truncate; albumen none; cotyledons thick.

Shrubs, with opposite, pinnate leaves. Flowers in terminal racemes.

1. STAPHYLEA. Linn.

Calyx 5-parted, covered at base by an urceolate disk; lobes oblong, concave, coloured. Petals 5, alternating with the sepals. Stamens 5, alternating with the petals. Ovary 2—3-lobed. Styles 2—3, sometimes united. Capsule 2—3-celled; cells membranaceous, inflated, united at base or throughout their whole length. Pentandria. Trigynia.

S. trifolia Linn.: leaves ternate, on long petioles; leafets ovate, acuminate, serrulate, pubescent, the terminal one petioled; styles glabrous; capsule bladder-like.

Hab. N. Y. to Car. W. to Miss. April—June. 7.—A shrub 6—10 feet high. Flowers white, in axillary and terminal pendulous panicles.

Bladder-nut.

ORDER XXXIII. RHAMNEÆ. De Cand. Lind.

Calyx 4-5-cleft, with a valvate æstivation. Petals distinct, cucullate or convolute, inserted into the orifice of the calyx, occasionally wanting. Stamens definite, opposite the petals. Disk fleshy. Ovary superior or half superior, 2-3-4-celled; ovules solitary, erect. Fruit fleshy and indehiscent, or dry and separating in 3 parts. Seeds erect; albumen fleshy, seldom wanting; embryo almost as long as the seed, with large flat cotyledons, and a short inferior radicle.

Trees or shrubs, often spiny. Leaves simple, alternate, rarely opposite, with minute stipules. Flowers axillary or terminal.

1. RHAMNUS. Linn.

Calyx 4—5-cleft, urceolate, persistent with and adhering to the fruit at base. Petals alternating with the lobes of the calyx, or none. Stamens 4—5, inserted above the petals. Style 2—4-cleft. Berry 2—4-celled; cells 1, rarely 2-seeded. Pentandria. Monogynia.

1. R. alnifolius L'Herit: unarmed; leaves alternate, oval, acuminate, serrulate, pubescent on the nerves beneath; flowers diœcious; peduncles A-flowered, aggregate; calyx acute; fruit turbinate.—R. franguloides Mich.

HAB. Rocky hills. Can. to Vir. rare. May, June. b.—
Flowers small, greenish, in axillary fascicles. Borries black.—

R. alnifolius of Pursh is described by De Candolle as a distinct species, under the name of R. purshianus.

2. R. catharticus Linn.: branches spiny; leaves opposite, ovate, erosely denticulate; flowers mostly 4-cleft, polygamo-dioecious; berries 4-seeded, subglobose.

Hab. Woods on mountains. N. S. Small tree or large shrub, with yellowish-green flowers. Introduced.?

Buck-tharn.

2. CEANOTHUS, Linn.

Calyx 5-cleft, campanulate, persistent and somewhat adhering with the fruit. Petals 5, small, saccate and arched, with long claws. Stamens exsert. Styles 2—3, united to the middle. Berry dry, (a capsule?) 3-celled, 3-seeded, 3-parted, opening on the inner side. Pentandria. Monogynia.

1. C. americanus Linn.: stem shrubby; branches terete and somewhat pubescent; leaves ovate-oblong, alternate, serrate, 3-nerved, tomentose, pubescent beneath, sometimes subcordate; panicles axillary, on long peduncles.

HAB. Woods. Can. to Flor. W. to Miss. July. 5.—Stem 2—3 feet high. Leaves on petioles. Flowers small, white, in a racemed panicle. Root very large, dark red.

New-Jersey Tca. Red-root.

2. C. herbaceus Raf.: leaves oval, slightly serrulate, smooth; panicles thyrsoid, axillary and terminal.—P. perennis Pursh.

HAB. Rocky places. Penn. to Car. Suffruticose. Leaves nearly as large as in the former, but smooth.

3. C. ovalis Big.: leaves oval, glandular-serrate, 3-nerved, the veins pubescent underneath; panicle corymbose, abbreviated.

Habe Shores of Lake Champlain. Dr. Boott.—Leaves 1—3 inches long, petioled, elliptical, obtuse or subacute. Peduncles shorter than in C. americana and the flowers larger. Fruit blackish.

ORDER XXXIV. ANACARDIACEÆ. Lind.

Flowers usually diclinious. Calyx usually small, persistent, 5-(sometimes 3-4-7) divided. Petals equal in number to the segments of the calyx, (sometimes wanting) periginous, imbricated in astivation. Stamens equal in number to the petals, and alternate, or twice as many or more; filaments distinct or cohering at the base. Disk fleshy, annular or cup-shaped, hypogynous, occasionally wanting. Ovary single (or rarely 5-6) free or rarely adhering to the calyx, 1-celled; styles 1-3, sometimes 4; stigmas as many. Fruit

indehiscent, usually drupaceous. Seed without albumen; radicle superior or inferior, next the hilum; cotyledons thick and fleshy or leafy.

Trees or shrubs, with a resinous, gummy, caustic, or even

milky juice. Leaves alternate, not dotted.

1. RHUS. Linn.

Calyx small, 5-parted, persistent. Petals 5, ovate, spreading. Stamens 5. Styles 3, short, or 3 sessile stigmas. Drupe nearly dry, with one bony seed.

Pentandria. Trigynia.

* Leaves ternate.

- 1. R. toxicodendron Linn: stem erect, pubescent near the summit; leaves ternate; leafets broad, oval, entire, sinuate or lobed, subpubescent beneath; flowers dioecious, in sessile axillary racemes.-R. toxicodendron, var. quercifolium Mich.
 - IIAB. Moist woods. Can. to Car. W. to Rocky mountains. June. 5.—Shrub 2-5 feet high. Flowers greenish.
- 2. R. radicans Linn.: stem climbing; leaves ternate; leafets petiolate, ovate, acuminate, smooth, generally entire; flowers in axillary racemes, towards the top of the stem, dioecious; fruit smooth.—R. toxicodendron, var. vulgare Mich. Pursh.—R. toxicodendron, var. radicans Torr.
 - HAB. Woods and hedges. Can. to Car. June. 5.—Stem climbing. Flowers greenish.—De Candolle thinks R. radicans distinct from R. toxicodendron. Both are very poisonous to persons of peculiar constitutions.—Barton's Collections. Big. Med. Bot. iii. 19. Christy in N. Y. Med. & Phys. Jour. N. S. i. 21.
- 3. R. aromatica Ait.: branches slender, nearly smooth; leaves ternate; leafets sessile, ovate-rhomboid, deeply toothed, tomentose beneath; flowers in dense axillary racemes or catkins, dioecious; fruit pilose.—Lobadium aromaticum Raf.

HAB. Mountains. N. Y. to Geor. W. to Miss. May, June. 7.—Shrub 2-6 feet high. Flowers yellowish. Fruit red.

** Leaves pinnate, smooth.

4. R. glabra Linn.: stem and branches smooth; leafets in many pairs, sessile, lanceolate, acuminate, sharply serrate, smooth, whitish beneath; flowers all perfect, in terminal compound panicles.

HAB. Old fields. Can. to Geor. July. 5 .- Shrub 6-12 feet high.

Flowers greenish-yellow. Fruit crimson, downy.

5. R. copallina Linn.: branches terete, downy; leafets 4-7 pairs, with an odd one, oval-lanceolate, very entire, shining on the upper surface; petiole winged, appearing as if jointed; flowers in sessile panicles, dioecious.

HAB. Dry fields. N. Y. to Car. July. 7.—A small shrub, with yellowish-green flowers. Fruit red, small, compressed, hairy.

Mountain Sumach.

6. R. venenata De Cand.: branches, leaves and petioles very smooth; leafets in 5-6 pairs, oblong-oval, abruptly accuminate, nearly entire; petioles without joints or wings; flowers in loose slender panicles, dioecious; fruit smooth, white.—R. vernix Linn.

Hab. Margins of swamps. N. Y. to Geor. June, July. b.—

Shrub 6—12 feet high. Flowers greenish. Poisonous. Big.

Med. Bot. i. 96.

Poison Ask.

*** Leaves pinnate, pubescent.

7. R. typhina Linn.: branches and petioles very villous; leafets in many pairs, lanceolate-oblong, acuminate, acutely serrate, pubescent beneath; flowers in oblong dense panicles, dioecious.

HAB. Rocky hills. Can. to Car. June. 5.—Shrub 10—15 feet high. Flowers greenish-yellow. Fruit in clusters, covered with a purple velvety down. Stag's Horn.

ORDER XXXV. LEGUMINOSÆ. De Cand. Lind.

Calyx 5-parted, toothed or cleft, inferior, with the odd segment anterior; the segments often unequal and variously combined. Petals 5, or by abortion 4, 3, 2, 1, or none, inserted into the base of the calyx, either papilionaceous or regularly spreading; the odd petal posterior. Stamens definite or indefinite, perigynous, either distinct or monadelphous, or diadelphous; very seldom triadelphous; anthers versatile. Ovary simple, superior, 1-celled, 1 or many-seeded; style simple, proceeding from the upper margin; stigma simple. Fruit either a legume or a drupe. Seeds attached to the upper suture, solitary or several, occasionally with an arillus; embryo destitute of albumen, either straight, or with a radicle bent upon the cotyledons; cotyledons either remaining under ground in germination, or elevated above the ground and becoming green like the leaves.

Herbs, shrubs or trees. Leaves with usually 2 stipules at the base.

SUBORDER I. PAPILIONACEÆ.

Calyx with distinct lobes. Stamens periginous. Corol papilionaceous.

1. BAPTISIA. Vent.

Calyx half 4-5-cleft, bilabiate. Petals 5, nearly equal. Standard with the sides reflexed. Stamens deciduous. gume ventricose, pedicelled, many-seeded.

Decandria. Monogynia.

B. tinctoria Brown: very smooth, much branched; leaves ternate, petioled, upper ones subsessile; leafets round-obovate; stipules setaceous; racemes terminal; legume on a long stipe .- Sophora tinctoria Linn .- Podalyria tinctoria Willd.

HAB. Sandy woods. Can to Car. July, Aug. 24.—Stem 2-3 feet high, very bushy. Flowers yellow. Whole plant turns Wild Indigo,

bluish-black in drying.

2. CROTALARIA. Linn.

Calyx 5-lobed, subbilabiate; upper lip 2, lower one 3-cleft. Standard large, cordate. Keel falcate, acuminate. ments all united, with the sheath often divided above. Legume turgid, inflated, with ventricose valves, often many-Diadelphia. Decandria. seeded, pedicelled.

1. G. sagittalis Linn.: hairy, erect, branched; leaves simple, oblonglanceolate; stipules lanceolate, acuminate, decurrent; racemes opposite the leaves, about 3-flowered; corol smaller than the calyx.—C. sagittalis, var. oblonga Mich.

HAB. Pine barrens. Penn. to Car. July, Aug. @.—Stem 12 inches high. Flowers yellow. Legume inflated. Varies much in its pubescence. Rattle-box.

2. C. parviflora Willd.; hirsute, erect, branched; leaves simple, linear-lanceolate hirsute; upper stipules decurrent, with two yery short teeth; racemes opposite the leaves; corol smaller than the calyx .- C. sagittalis, var. linearis Mich.

HAB. Sandy fields. N. Y. to Car. June, July. O .- Leaves

2-3 inches long. Flowers yellow.

3. GENISTA. Lam.

Calyx bilabiate, upper lip bipartite; lower one 3-toothed, or 5-lobed; 3 lower lobes united almost to the summit Standard oblong-oval. Keel oblong, straight. Stamens mo-Legume flat-compressed or rarely somewhat nadelphous. turgid, many-seeded, rarely few-seeded.

Diadelphia. Decandria.

G. tinctoria Linn.: root creeping; stem subcrect, suffruticose; branches terete, striate, erect; leaves lanccolate, smooth; flowers in spiked-racemes and with the legumes smooth.

Hab. Hills, near Boston. Big. July. 5.—Suffruticose. Stem a foot high, with numerous branches. Flowers on the upper part of the branches, nearly sessile, yellow. Said to afford a fine yellow dye. Introduced.

Dyer's Weed.

4. MEDICAGO. Linn.

Calyx subcylindric, 5 cleft. Keel somewhat remote from the standard. Stamens diadelphous. Legume many-seeded, varying in form, always falcate or twisted into a spiral.

Leaves ternate. Diadelphia. Decandria.

1. M. lupulina Linn.: stem procumbent; leafets obovate-cuneate, denticulate at the apex; stipule lanceolate, acute, somewhat entire; peduncles in racemed-spikes; flowers sessile; legumes reniform, 1-seeded, veined and rugose; seeds ovate, somewhat reniform.

HAB. Fields. Throughout the U.S. June—Aug. . —Spikes small, yellow. Introduced. None-such.

2. M. intertexta Willd.: stem procumbent; leafets obovate, toothed; stipules ciliate-toothed; peduncles somewhat 2-flowered; legume pilose, cochleate, membranaceous, obliquely reticulate; spines straight, thick, rigid and acute.

HAB. Sandy fields. Conn. and Car. July, Aug. . -Flowers

yellow. Introduced.

5. MELILOTUS. Tourn.

Calyx tubular, 5-toothed. Keel simple; wings shorter than the standard. Legume as long as the calyx, coriaceous, one or few-seeded, scarcely dehiscent, varying in form.

Leaves ternate. Diadelphia. Decandria.

1. M. officinalis Willd.: stem erect, branching; leafets lanceolate-oblong, obtuse, remotely serrate; spikes axillary, paniculate; legume 2-seeded, rugose; style filiform, as long as the legume; seeds unequally cordate.—Trifolium officinale, var. a. Linn.

HAB. Fields. N. S. Aug. @.—Stem 2—4 feet high. Flowers in long racemes, yellow. Plant giving out an odour when dry, similar to the vernal grass. Introduced. Yellow Melilot.

2. M. leucantha De Cand.: stem erect, branched; leafets ovate-oblong, truncate and mucronate at the apex, remotely serrate; stipules setaceous; teeth of the calyx unequal, as long as the tube; standard longer than the keel and wings; legume 1-seeded, ovate, lacunoserugose, green; seeds exactly ovate.—M. vulgaris Willd. Enum. Trifolium officinale, var. b. Linn.

HAB. Fields. N. S. July, Aug. 3.—Stem 3—5 feet high.

Flowers white. Raceme longer and less crowded than in the
former. Both species become fragrant upon drying. Introduced.? White Medilot. Scented Clover.

6. TRIFOLIUM. Tourn.

Calyx tubular, persistent, without glands, 5-cleft; segments subulate. Keel shorter than the wings and standard. Stamens diadelphous. Legume small, scarcely dehiscent, often ovate, 1—2-seeded, as long as the calyx and covered by it, rarely oblong, 3—4-seeded, and a little exceeding the calyx.—Leaves ternate.

Diadelphia. Decandria.

- * Legume 1-seeded. Standard of the corol deciduous. Flowers not yellow.
- 1. T. arvense Linn.: stem erect, simple or branched, pubescent; leaves on short petioles; leafets linear-obovate, hairy, somewhat 3-toothed at the apex; stipules narrow, membranaceous, with very long nerves, subulate, pilose; spikes oblong, villous, cylindrical; calyx very pilose; segments equal, longer than the many petalled corol.

Hab. Dry pastures. Can. to Car. June—Sept. O.—Stem 6—10 inches high. Flowers minute, white or pink. Seeds ovoid, brown.

Stone Clover. Hare's foot Trefoil.

2. T. pratense Linn.: stem subcrect, branched; leaves on long petioles; leafets oval, nearly entire; stipules broad, nerved, smooth, shortly acuminate, inflexed; heads of flowers ovate, obtuse, subsessile; calyx hairy; lower tooth shorter than the tube of the monopetalous unequal corol; seeds reniform, compressed.

HAB. Meadows. May—Oct. 24.—Stem 1—2 feet high. Flowers rose-coloured. Seeds yellowish. Introduced. Red Clover.

3. T. pennsylvanicum Willd.: stem ascending, much branched, flexuous; leafets ovate-elliptic, obtuse, very entire; stipules awned; heads of flowers ovate-cylindrical, solitary, dense; lower tooth of the calyx shorter than the monopetalous corol.

Hab. Woods. Penn. to Virg. June—Sept. 21.—Flowers fine red. Resembles T. medium of Linnæus.

- ** Legume 1-seeded. Standard of the corol persistent, scariose. Flowers yellow.
- 4. T. procumbens Linn.: stems procumbent; leaves on short petioles; leafets obovate or obcordate, denticulate, terminal one petioled; stipules ovate, ciliate, shorter than the petiole; heads axillary, ovate; peduncles equal to or longer than the leaves; segments of the calyx unequal, the 2 upper ones very short; seeds elliptic.

Hab. Dry fields. Mass. to Virg. June. ©.—Stem spreading, 3—6 inches long. Flowers numerous and with the seeds yellow. Introduced.? According to De Candolle T. campestre is a mere var. with erect branching stems.

Yellow Clover.

5. T. agrarium Linn.: stem ascending, with erect branches; leaves nearly sessile; leafets oblong-ovate, sessile, denticulate; stipules leafy, lanceolate, acute, longer than the petiole; heads on long pe-

duncles, oval; standard obcordate; calyx campanulate, short; segments unequal, smooth, elongated, the upper one smaller; legume oval, compressed; seeds cordate.

HAB. Meadows and woods. Penn. to Virg. June-Aug. .

-Stem a foot high. Flowers small, light yellow.

*** Legume 3-8-seeded.

6. T. repens Linn.: stem creeping and somewhat rooting, leafets oboyate-roundish, somewhat retuse, denticulate; stipules scariose, narrow-lanceolate, with a long mucronate point; heads axillary, on very long peduncles; flowers pedicelled and at length reflexed; segments of the calyx unequal, shorter than the corol; legume 4-seeded.

Hab. Meadows. Throughout the U. S. May—Oct. 21.— Stem 6—12 inches long. Flowers white, Seeds brown.

es long. Flowers white, Seeds brown.

White Clover.

7. T. reflexum Linn.: pilose; stem ascending; leafets ovate or obovate, serrulate; stipules leafy, lanceolate-acuminate; heads globose, axillary; flowers on long pedicels, at length reflexed; segments of the calyx hairy, nearly equal, very narrow, one-nerved, nearly twice as

long as the tube but shorter than the standard; legume 4-seeded.

Hab. Dry hills. Penn. to Geor. June, July. 21.—Whole plant very pubescent. Flowers in large heads, red. In my specimens the stipules are obliquely cordate, as stated by Mr. Elliott. Known at the south by the name of Buffalo Clover.

- 8. T. stoloniferum Muhl.: stoloniferous, smooth; lower leaves on long petioles; leafets obovate or wedge-form, serrulate, retuse or emarginate at the apex; stipules membranaceous, broad-lanceolate; flowers in globose heads, pedicelled, erect, at length reflexed; segments of the calyx nearly equal, narrow, smooth, longer than the tube.
 - Hab. N. Y. Penn. W. to the Miss. June. 21.—Stem 4—8 inches long. Flowers in middle sized heads.—I suspect this is not specifically distinct from the preceding. The specimens collected by myself on the Mississippi, as well as that received by my brother from Dr. Muhlenberg, agree very well with that plant, except in the absence of pubescence, and in the smaller size of the heads of flowers.

 Running Buffalo Clover.

7. CLITORIA. Linn.

Calyx surrounded at base by 2 larger bracts, 5-cleft. Corol resupinate. Standard large, covering the wings. Stamens diadelphous. Style somewhat dilated at the apex. Legume linear, compressed, straight, 2-valved, 1-celled, many-seeded.

Diadelphia. Decandria.

1. C. mariana Linn.: stem climbing, glabrous; leaves ternate; leafets ovate-lanceolate; peduncles solitary, 1-3-flowered; calyx tubu-

lar-campanulate, glabrous, much longer than the lanceolate bracts; teeth nearly equal; legume torulose.

Penn. to Car. July, Aug. 24.--Banks of streams. Stem climbing, sometimes erect. Flowers large, pale blue.

2. C. virginiana Linn. : stem twining, and with the ovate leafets glabrous or subpubescent; peduncle 1-4-flowered; calyx 5-parted, about as long as the lanceolate bracts; legume linear, compressed.

HAB. Hedges. Penn. to Car. Aug. 21.—Flowers purple or violet, larger than that of any of our North American Papilionaceæ. De Candolle describes three varieties of this species, which differ only in the shape of the leaves. Butterfly Weed.

8. GALACTIA. Mich.

Calyx bibractiate, 4-cleft; segments acute, nearly equal. Corol papilionaceous; petals 5, oblong, distinct. Standard incumbent, broader than the others. Stamens diadelphous. Style smooth. Stigma obtuse. Legume terete or compressed, many-seeded, bivalved, 1-celled, elongated.

Diadelphia. Decandria.

1. G. mollis Mich.: stem twining, softly-villous; leaves ternate; leafets ovate-oblong, obtuse, pale beneath; racemes axillary, a little longer than the leaves, pedunculate; flowers pedicelled; calyx acuminate, villous; legume compressed, villous.—Hedysarum volubile Linn.

Hab. Pine barrens. N. J. to Car. July, Aug. 24.—Stem prostrate or climbing. Flowers small, purple.

2. G. glabella Mich.: stem prostrate, somewhat twining, smooth; leaves ternate; leafets eliptic-oblong, obtuse, emarginate at each end, shining above; racemes axillary, simple, few-flowered, on peduncles as long as the leaves; calyx smooth; legumes pubescent, (smooth, Nutt.) -Ervum volubile Walt.

HAB. Pine barrens. N. J. to Car. Aug. 21.-Flowers reddishpurple, large. Root fusiform.

9. TEPHROSIA. Pers.

Calyx without bracts, nearly equal, 5-toothed. Standard of the corol large, roundish, pubescent or sericeous without, reflexed-spreading; wings adhering to the obtuse keel. Stamens none or diadelphous. Legume compressed-flat, linear, many-seeded. Seeds compressed. Diadelphia. Decandria.

T. virginiana Pers.: erect; leafets 8-12 pairs, oval-oblong, mucronate, white villous beneath; raceme terminal, subsessile; legumes falcate villous .- Galega virginiana Linn.

HAB. Barrens. Can. and throughout the U.S. July. 21.-Stem a foot high. Flowers varied with red, yellow and white. Goat's Rue.

10. AMORPHA. Linn.

Calyx 5-toothed, obconic-companulate. Standard of the corol ovate, concave; wings and keel none. Style filiform, straight, glabrous. Stamens exserted, monadelphous at base. Legume compressed, ovate or lunulate, 1-celled, 1—2-seeded. Diadelphia. Decandria.

A. fruticosa Linn.: subarborescent, smooth; leaves pinnate, petiolate; leafets elliptic-oblong; spikes aggregated, long; calyx hoary, 4 teeth, obtuse, the other one acuminate; legume few-seeded.

HAB. N. J. to Car. W. to Rocky mountains. July. b.—A shrub, with spikes of purple flowers. Varies with emarginate, mucronate and narrower leaves. Wild Indigo.

11. ROBINIA. De Cand.

Teeth of the calyx 5, lanceolate, two upper ones approximate. Corol papilionaceous. Standard large. Keel obtuse. Stamens diadelphous, deciduous. Legume compressed, subsessile, many-seeded; valves flat, thin.

Diadelphia. Decandria.

R. psculacacia Linn.: leaves pinnate, with an odd leafet; stipules prickly; racemes pendulous, and with the legume smooth; teeth of the calyx unarmed.

Hab. Near cultivated grounds, but apparently native. N. Y. to Car. W. to Miss. May.—A large tree, the wood of which is much esteemed in ship building. Flowers white, odorous, in long racemes.

Locust Tree.

12. ASTRAGALUS, Linn.

Calyx 5-toothed. Corol with the keel obtuse. Stamens diadelphous. Legume 2, or half 2-celled; lower suture inflexed.

Diadelphia. Decandria.

1. A. canadensis Linn: erectish, subpubescent; leafets 10—12 pairs with an odd one, elliptic-oblong, rather obtuse, smooth on both sides; stipules lanceolate, acuminate; peduncles about as long as the leaves; flowers spiked; bracts shorter than the calyx; legume erect, ovate, terete, smooth.

Hab. Banks of streams. Can. to Car. W. to Miss. June. 21.
—Stem 2 feet high. Flowers pale yellow. Milk Vetch.

2. A. carolinianus Linn.: erect, smooth; leafets 20 pairs, with an odd one, oblong, pubescent beneath; stipules ovate, acuminate; peduncles longer than the leaves; flowers spiked; bracts as long as the pedicels; legume erect, ovate, tumid, rostrate.

Hab. Mountains. Penn. to Car. June, July. 21.—Spikes dense. Flowers yellow. Perhaps only a variety of the former.

13. STYLOSANTHES. Swartz.

Tube of the calyx very long, slender; limb 5-parted, lobes unequal. Corol inserted into the calyx. Keel minute, bifid at the apex. Stamens monadelphous. Style filiform, very long, straight. Stigma capitate, hispid. Legume with two joints; joints 1-seeded; upper one subuncinate, acuminated into the base of the style.

Diadelphia. Decandria.

S. clatior Swartz.: stem erect, herbaceous, pubescent on one side; leaves ternate; leafets lanceolate, smooth, acute; bracts lanceolate, ciliate; spikes few-flowered; legume indurated, 1-seeded.—S. hispida Mich.—Arachis aprica Walt.

HAB. Sandy woods. Penn. to Car. July, Aug. 24.—Stem a foot high, branched. Flowers yellow, in terminal compact heads.

Pencil Flower.

14. ÆSCHYNOMENE. Linn.

Calyx 5-cleft, bilabiate; upper lip 2-cleft or 2-toothed; lower one 3-cleft, or 3-toothed. Corol papilionaceous. Stamens 10, in two equal sets. Legume compressed, transversely jointed, erect, exsert; joints 1-seeded.

Diadelphia. Decandria.

E. hispida Willd.: stem herbaceous, erect, and with the petioles and peduncles hispid; leaves in many pairs; leafets linear, obtuse; racemes simples, 3—5-flowered, legumes distinctly stipitate, with 6—9 hispid joints.—Hedysarum virginicum Linn.?

Hab. Marshes. Penn. to Car. July, Aug. @.—Stems 2—3 feet high. Leafets 20—25 pairs. Flowers yellow and red.

15. DESMODIUM. Dc Cand.

Calyx with 2 bracts at base, obscurely bilabiate to the middle; upper lip bifid; lower one 3-parted. Corol papilionaceous. Standard roundish; keel obtuse, not truncate; wings longer than the keel. Stamens diadelphous (9 and 1); filaments subpersistent. Legume with many joints; joints compressed, 1-seeded, membranaceous or coriaceous; scarcely dehiscent.

Diadelphia. Decandria.

- 1. D. canadense De Cand.: leaves ternate; leafets oblong-lanceolate, somewhat glabrous; stipules filiform; racemes terminal; legumes jointed; joints 4—5, oval, obtuse, triangular, hispid.—Hedysarum canadense Linn.
 - Hab. Dry woods. Can. to Car. W. to Miss. July. 21.—

 Stem 3 or 4 feet high, erect. Leafets 3 inches long. Flowers

 purple.

 Bush Trefoil.

2. D. caneseens De Cand.: stem erect, hairy, with the angles hispid; leaves ternate; leafets ovate, roundish, with whitish appressed hairs beneath; stipules ovate; racemes panicled; bracts cordate; legumes jointed; joints triangular, hispid.—Hedysarum canescens Linn.—H. seaberrimum Ell.?

HAB. Dry woods. Can. to Car. June—Aug. 21.—Stem 3-4 feet high, and more scabrous than any other American species.

Flowers pale purple, middle-sized.

3. D. marylandicum De Cand.: stem erect, pilose, branching; leaves ternate; leafets oblong, villous beneath; stipules subulate; racemes paniculate; legumes 3-jointed; joints rhomboidal, reticulate, somewhat hairy.—H. marylandicum Linn.

HAB. Dry fields and woods. N. Y. to Car. July, Aug. Stem hairy above. Flowers purple, in a somewhat loose and

slender panicle.

4. D. obtusum De Cand.: stem erect or ascending, pubescent; leaves ternate; leafets ovate, obtuse, subcordate at base; stipules lanceolate-subulate; panicle terminal; joints of the legume semi-orbiculate, reticulate, hispid.—H. obtusum Muhl. in Willd.

Hab. Woods. N. Y. to Car. July, Aug. 21.—Stem 2—3 feet high, sometimes cespitose. Flowers purple, in a terminal pani-

cle.

5. D. viridiflorum Beck: stem erect; leaves ternate; leafets ovate, obtuse, scabrous on the upper surface, villous and very soft beneath; panicle terminal, very long, naked; joints of the legume triangular.

-Hedysarum viridiflorum Linn. Ell. Torr. not of Pursh.

HAB. Woods. N. Y. to Car. July. 21.—Stem 3-4 feet high, very scabrous towards the summit. Leaves very scabrous on the upper surface, clothed with a velvet-like tomentum on the under. Flowers purple within, greenish without. This is undoubtedly the true H. viridiflorum of Linnæus; a plant which seems to be quite distinct from the next. See Ell. Sk. ii. 217.

6. D. aikinianum Beck: stem erect, branching, pubescent; leaves ternate; leafets ovate-oblong and sub-deltoid, acute, mucronate, scabrous beneath; stipules lanceolate-cuspidate; racemes paniculate, bracted; legumes with scabrous oval joints.—D. viridiflorum De Cand.?

-Hedysarum viridiflorum Pursh.-H. aikini Eat.

HAB. Woods and old fields. N. Y. Penn. July, Aug. 24.—
Stem 3 feet high. Flowers reddish-purple, becoming green when
dry. This plant differs from the true H. viridifforum in the
leaves being very scabrous beneath, and was very properly separated by Prof. Eaton in the last edition of his Manual of
Botany.

7. D. ciliare De Cand.: stem erect, branching, pubescent; leaves ternate, on short petioles; leafets small, oval-obtuse, pubescent underneath, fringed along the margin; racemes axillary and terminal, paniculate; joints of the legume (2-3) oval, hispid.—Hedysarum ciliare Nutt.

- HAB. Woods. Penn. to Car. Aug. 21.—A small and slender species about 2 feet high. Flowers small, violet, in a slender branched panicle.
- 8. D. lavigatum De Cand.: stem simple, erect, smooth, somewhat glaucous; leaves ternate, on long petioles; leafets ovate, acute; panicle terminal; flowers in pairs, on long pedicels; bracts ovate, acute, shorter than the flower buds; lower segment of the calyx elongated; joints of the legume triangular.—Hedysarum laxigatum Nutt.

Hab. Woods. N. J. to Car. Aug. 21.—Stem 3-4 feet high. Flowers purple. The smoothest of the North American species.

- 9. D. bracteosum De Cand.: stem erect, smooth; leaves ternate; leafets oblong-oval, acuminate, smooth; stipules subulate; racemes terminal, few-flowered; bracts ovate, acuminate, striate, glabrous; legume with suboval joints.—Hedysarum bracteosum Mich.
 - b. cuspidatum De Cand.: leafets scabrous on the margin; stipules ovate-lanceolate; joints of the legume reticulate, glabrous. pubescent on their margins.—Hedysarum cuspidatum Willd.
 - Hab. Woods. Penn. to Car. Aug. 21.—Stem 3—5 feet high. Flowers large, purple, violet.
- 10. D. paniculatum De Cand.: stem erect, smooth, leaves ternate; leafets oblong-lanceolate, or elliptical, smooth; stipules subulate; panicle terminal; legumes with 4 rhomboidal pubescent joints.—Hedysarum paniculatum Linn.
 - HAB. Dry woods. Can. to Car. W. to Miss. Aug. 24.—Stem 3 feet high, slender. Leaves long. Flowers purple.
- 11. D. strictum De Cand.: stem stiffly erect, simple, subpubescent; leaves ternate; leafets sublinear, smooth, reticulate, glaucous beneath; stipules subulate; panicles terminal, pedunculate, few-flowered; legume incurved, with sublunate-triangular hispid joints.—Hedysarum hirtum Pursh.
 - Hab. Pine barrens. N. J. to Car. W. to Miss. Aug. 21.—
 Stem slender, very erect. Leafets narrow. Flowers small, purple, in long axillary and terminal panicles.
- 12. D. acuminatum De Cand.: stem erect, simple, pubescent; leaves ternate, on very long petioles; leafets ovate, conspicuously acuminate, somewhat hairy, the odd one roundish-rhomboidal; panicle terminal, on a very long peduncle; petioles somewhat pilose; joints of the legume roundish, glabrous.—Hedysarum acuminatum Mich.

Hab. Shady woods. Can. to Car. W. to Miss. July, Aug. 21.

—Panicle 1—2 feet long. Flowers purple.

13. D. nudiflorum De Cand.: stem erect, simple, somewhat glabrous; leaves ternate; leafets broad-ovate, acuminate; scape paniculate, smooth, radical; joints of the legume obtusely-triangular, somewhat glabrous.—Hedysarum nudiflorum Linn.

HAB. Woods. Can. to Car. Aug. O .- Stem 8-10 feet high.

Scape 2-3 feet long, slender. Flowers purple.

14. D. rotundifolium De Cand.: stem prostrate, hirsute; leaves ternate; leafets suborbicular, hairy; stipules roundish-cordate, reflexed; racemes axillary, paniculate; joints of the legume subrhomboidal, reticulate, scabrous.—Hedysarum rotundifolium. Mich.—H. canescens. Willd.

Hab. Rocky woods. N. Y. to Car. Aug. 21.—Racemes few-flowered. Flowers purple.—The southern plant seems to differ

from the northern, and may prove distinct.

15. D. humifusum Beck: stem prostrate, smooth; leaves ternate; leafets ovate, slightly hairy; racemes terminal, elongated; joints of the legume subrhomboidal.—Hedysarum humifusum. Muhl. Torr. Big.

Hab. Woods. Mass. Penn. to Car. Muhl. Aug. 24.—Resembles the last, but is smoother and has the leafets oval or ovate and subacute.—Perhaps only a variety.

16. HEDYSARUM. De Cand.

Calyx 5-cleft; segments linear-subulate, nearly equal. Standard large. Keel obliquely truncate; wings much shorter than the keel. Stamens diadelphous (9 and 1.) Legume with many joints; joints compressed, roundish, 1-seeded.

Diadelphia. Decandria.

H. boreale Nutt.: stem subdecumbent; leaves pinnate; leafets (7 or 8 pairs) oblong-ovate, partly villose; stipules sheathing, subulate; racemes on long peduncles; legumes with smooth, rugose, roundish joints.—H. alpinum Mich.?

HAB. Mountains. Can. and Penn. Mich. W. to Fort Mandan, on the Missouri. Nutt. June, July. 21.—Flowers numerous,

purple.

17. LESPEDEZA. Mich.

Calyx with bracts at base. 5-parted; segments nearly equal. Corol papilionaceous. Keel transversely obtuse. Stamens diadelphous (9 and 1.) Legume lenticular, compressed, flat, not opening, 1-seeded, unarmed.—Leaves ternate.

Diadelphia. Decandria.

1. L. reticulata Pers.: stem erect, simple, nearly smooth; leafets oblong-linear, obtuse, mucronate, hairy beneath; fascicles of flowers subsessile, numerous; axillary ones subracemose; legume ovate, reticulate, acute, longer than the calyx.—L. sessiliflora, var. Mich.—L. angustifolia. Raf.—Hedysarum reticulatum Muhl. in Willd.

HAB. Dry woods. N. J. W. to Ill. Aug. 21.—Stem 2 feet high, slender, never branched. Leafets 2 lines broad. Flowers

violet.

2. L. sessiliflora Nutt.: stem erect, somewhat branched; leaves on short petioles; leafets oblong-oval, obtuse; fascicles of flowers subsessile; axillary ones partly racemose; legume naked, acute.—Hedy-sarum sessiliflorum Lam.

- HAB. Dry woods. N. Y. to Flor. Aug., Sept. 21.—Stem 2-3 feet high, slender. Leaves hairy beneath. Flowers violet.
- 3. L. sturci Nutt.: stem simple, erect, softly and sericeously villous; leaves on very short petioles; leafets elliptic-oval, mucronate; racemes pedunculate, scarcely longer than the leaves; legumes pubescent, naked, longer than the calyx.

HAB. Sandy fields. N. J. to Car. July, Aug. 21.—Stem 2-3 feet high, covered with a silky pubescence. Peduncles an inch

long. Flowers purple.

- 4. L. frutescens Ell.: stem erect; leaves on short petioles; leafets elliptical, obtuse, silky-pubescent beneath; racemes axillary, subsessile, shorter than the leaves; calyx shorter than the corol; legume pilose, shorter than the calyx.—L. fruticosa Pers.—Hedysarum frutescens Linu.
 - HAB. Dry woods. Penn. to Car. Sept. 24.—Stem 2—3 feet high. Flowers white and red.
- 5. L. capitata Mich.: stem erect, simple; leaves on very short petioles; leafets elliptic, with close pressed hairs beneath; spikes capitate, on short peduncles, axillary and conglobate-terminal; calyx villous, as long as the corol, with the legume much longer.—Hedysarum conglomcratum Lam.
 - HAB. Borders of woods. Can. to Car. W. to Miss. July, Aug. 21.—Stem 2—3 feet high. Flowers purple.—This may be only a variety of the last, although it is not so considered by De Candolle.
- 6. L. angustifolia Ell.: stem erect, pubescent; leaves on very short petioles; leafets oblong-eliptic or lanceolate, white pubescent beneath; racemes capitate, longer than the leaves; corol longer than the calyx.

 —L. capitata, var. angustifolia Pursh.

HAB. Sandy woods. N. Y. to Car. Sept. 21.—Stem 3—4 feet high. Leafets very narrow, villous beneath. Flowers white and purple, in small heads.

7. L. polystachya Mich.: stem erect, branched, very villous; leaves on very short petioles; leafets round-oval, obtuse; spikes oblong, axillary, pedunculate, twice as long as the leaves; corol and legume about as long as the calyx.—L. hirta Ell. Torr.—Hedysarum hirtum Linn.

Hab. Dry woods. N. Y. to Car. Aug., Sept. 21.—Stem 2—4 feet high. Flowers reddish-white, in dense racemes on peduncles which are longer than the leaves.

- 8. L. violacea Pers.: diffuse, much branched, somewhat pubescent; leaves on long petioles; leafets elliptic-obtuse, somewhat hairy; racemes subumbelled, about as long as the leaves; flowers in pairs, distinctly pedicellate; legume rhomboidal, reticulate and smooth.—Hedysarum violaceum Linn.
 - HAB. Dry woods. Can to Car. W. to Miss. July. 21.—Stem long, slender. Flowers violet.—Lespedeza divergens of Pursh, is probably only a variety of the above, although Mr. Elliott con-

siders it very distinct. "It is," he says, "distinguished by much larger leaves on much longer petioles, its stem is much more diffusely branched, the peduncles long with the flowers scattered and distinctly racemose."

- 9. L. procumbens Mich: slender, procumbent, every where pubescent; leaves on long petioles; leafets oval, obtuse, mucronate; peduncles very long, setaceous; racemes short, subumbellate; flowers in pairs, distinct; legume oval, nearly smooth.—Hedysarum lespedcza Lam.
 - HAB. Sandy woods. Can. to Car. W. to Miss. Aug., Sept.
 24. Stem 2-3 feet long. Flowers purple, with yellow spots.
- 10. L. prostrata Pursh: smooth, prostrate; leaves on very short petioles; leafets obovate-elliptic, obtuse; racemes axillary and terminal, subpaniculate; peduncles very long; legumes oval, subpubescent.—Hedysarum prostratum Muhl. in Willd.

HAB. Sandy soils. N. J. to Car. Aug. 24.—Very similar to the preceding species. Flowers violet.

11. L. repens Bart.: leaves ternate; leafets roundish-elliptical; emarginate; racemes axillary; legume repand.—Hedysarum repens Willd.

HAB. Woods. Penn. and Virg. Muhl. July. 21.—This may be identical with the last.

18. VICIA. Linn.

Calyx tubular, 5-cleft or 5-toothed; two upper teeth shorter.

Corol papilionaceous. Stamens diadelphous. Style filiform, bearded beneath the stigma. Legume oblong, 1-celled, many-seeded.

Diadelphia. Decandria.

* Flowers on peduncles.

1. V. caroliniana Walt.: smoothish; leafets 8—10, elliptical-lanceolate, subalternate, obtuse, mucronate; stipules ovate-lanceolate, entire; peduncles many-flowered, as long as or longer than the leaves; flowers distant; teeth of the calyx short; style villous at the top; legume lanceolate, smooth, obliquely veined.—V. parviflora Mich.

Hab. Mountains. Penn. to Car. May, June. 21.—Stem long and climbing. Flowers small, white. Standard black at the tip.

2. V. americana Muhl.: leafets 8—12, elliptical-lanceolate, obtuse, smooth, mucronate; stipules semisagittate, deeply toothed; peduncles 4—10-flowered, shorter than the leaves.

HAB. Shady woods. Penn. W. to Miss. June. 21.—Stem long. Leaves distant. Flowers purple.

American Vetch.

3. V. cracea Linn.: stem branching; leafets numerous, oblong, alternate and opposite, mucronate, pubescent; stipules semisagittatelinear; peduncles many-flowered, as long as or longer than the leaves;

racemes crowded, secund; teeth of the calyx unequal; upper ones very short; lower ones shorter than the tube; styles hairy at the top; legume oblong, coriaceous, compressed.

HAB. Meadows. N. S. Aug. 21 .- Stem subpubescent. Leaves pinnate. Flowers small, pale purple, numerous, drooping and Tufted Vetch.

imbricated.

** Flowers nearly sessile.

4. V. sativa Linn.: leafets 10-12, obovate-retuse or oblong-retuse, mucronate, smooth or hairy; stipules semisagittate, toothed, with a dark spot beneath; flowers mostly in pairs, sessile; calyx cylindric; segments linear-lanceolate, nearly equal; style bearded at the top; legume compressed.

HAB. Fields. Can. to Car. June. O.—Stem 1—2 feet high. Flowers small, blue. A very variable species. Common Vetch.

19. ERVUM. Linn.

Calyx 5-cleft, segments linear, acute, nearly equalling the corol. Stigma glabrous. Legume oblong, 2-4 seeded. Diadelphia. Decandria.

* Legume broad-oblong, 2-seeded.

1. E. hirsutum Linn. : leafets linear, obtuse, mucronate; stipules semisagittate, narrow; peduncles 3-6-flowered, shorter than the leaves; segments of the calyx linear-lanceolate, equal, longer than the tube; legume oblong, compressed, hairy, finely reticulate; seeds globose, variegated .- Vicia Michelli Raf.

AB. Fields. N. Y. to Car. May, June. @.—Stem 2—3 feet long, much branched and diffuse. Leaves cirrose. Flowers very small, bluish-white. Hairy Tare.

** Legume oblong-linear, 4-6-seeded.

2. E. tetraspermum Linn.: stems cespitose, branching; leafets 4-6, oblong mucronate; stipules lanceolate semisagittate; peduncles 1-4flowered, filiform; segments of the calvx unequal, broadish, shorter than the tube; legume oblong, compressed, smooth; seeds subglobose, black .- Vicia pusilla Muhl.

HAB. Fields, &c. N. S. May, June. . Stems very slender. Flowers minute, bluish-white. Smaller and slenderer than the last. Smooth Tare.

20. PISUM. Linn.

Segments of the calyx leafy; two upper ones shorter. Standard large, reflexed. Style compressed, keeled, villous Legume oblong, compressed, not winged. Seeds many, subglobose, with a roundish hilum.

Diadelphia. Decandria.

P. maritimum Linn.: stem square, compressed; petioles flat above; leafets 5-8, ovate or rounded, often alternate, somewhat pubescent : stipules ovate-semisagittate; peduncles many-flowered, shorter than the leaves; legumes oblong, obliquely reticulate, small; seeds small,

numerous, roundish .- Lathyrus maritimus Big. ?

HAR. Shores of the great lakes. Nutt. Salt marshes, Boston. Big.? May, July. 24.—Plant pale green. Flowers blue and purple, large, 6—8 in a raceme.—I insert this plant upon the authority of Pursh, Nuttall and other authors, but have no means of determining whether it is truly a *Pisum*. Dr. Bigelow's plant, of which I have specimens from Dr. C. Pickering, seems to me to be a Lathyrus; but until the question of the identity of these plants is more satisfactorily determined, I have thought proper Beach Pea. to leave them as above.

21. LATHYRUS. Linn.

Calyx campanulate, 5-cleft; two upper lobes shorter. Corol papilionaceous. Stamens diadelphous. Style flat, dilated at the summit, villous or pubescent on the upper side. Legume oblong, many seeded, 2-valved, 1-celled. Seeds globose Diadelphia. Decandria. or angled.

1. L. venosus Muhl.: stem square, naked; leaves pinnate; leafets numerous, (about 5 pairs) ovate, obtuse, subopposite, mucronate, smooth, veined; stipules semisagittate, ovate; peduncles many-flowered, shorter than the leaves.

HAB. Low meadows. N. Y. Penn. July, Aug. 21.-Leafets Veiny-leaved Vetchling. large. Flowers purple.

2. L. palustris Linn.: stem smooth, winged, weak; leafets in 3-pairs, oblong, mucronate; stipules semisagittate, acute; peducles 3-5flowered, a little longer than the leaves; segments of the calyx unequal, sublinear, as long as the tube; legume compressed.

HAB. Low grounds. Can. and N. S. June, July. 21 .- Stem

lax. Leafets varying in width. Flowers pale purple.

3. L. myrtifolius Muhl.: stem weak, flexuous, square; leafets 4, oblong-lanceolate, somewhat obtuse, mucronate, rigid, smooth, veined; stipules semisagittate, lanceolate, acuminate, scabrous on the margin; peduncles 3-4-flowered, longer than the leaves.

HAB. Salt marshes. N. Y. and Penn. July, Aug. 21.-Resembles the former. Flowers smaller, purple and rose-coloured.

4. L. glaucifolius Beck: stem nearly erect, acute-angled; leafets in 3-pairs, ovate, obtuse, mucronate, glaucous and reticulate beneath; stipules large, semisagittate, broad-ovate, acuminate; peduncles 4-10flowered, shorter than the leaves; legume compressed, glabrous.

Hab. Rocky banks of the Raritan river near New-Brunswick, N. J. May, June. 21 —This plant appears to me to be decidedly distinct. The leafets are uniformly broader and larger than in any American species, being from 1 1-2—2 inches long and 1 broad, and very strikingly glaucous on the under side. The flowers also are large and pale yellow. It was first noticed by my lamented friend, the late Rev. John De Witt, D. D. of Rutgers College, who was adding to his other attainments, a knowledge of the botanical productions of the interesting region around New-Brunswick.

22. AMPHICARPA. De Cand.

Calyx campanulate, 4-toothed, without bracts at base; teeth equal, somewhat obtuse. Corol papilionaceous. Petals oblong. Standard broad, incumbent, subsessile. Stanens diadelphous. Style filiform. Stigma capitate. Legume compressed, stiped, 1—4-seeded.

Diadelphia. Decandria.

A. monoica Ell.; stem hairy; leaves ternate; leafets ovate, smooth; racemes of the stem pendulous, bearing petals, sterile; radical peduncles bearing apetalous fertile flowers.—Glycine monoica Linn.

HAB. Woods. N. Y. to Car. July, Aug. 21.—Stem twining, slender. Flowers purple.

23. APIOS. Pursh.

Calyx campanulate, with 4 obsolete teeth, 1 acute and elongated under the keel. Corol papilionaceous. Keel falcate reflecting the apex of the standard. Stamens diadelphous. Stigma emarginate. Legume coriaceous, many-seeded.

Diadelphia. Decandria.

A. tuberosa Moench .- Gylcine apios Linn.

Hab. Woods. N. Y. to Car. July, Aug. 21.—Root tuberous.

Stem twining. Leaves pinnate; leafets 5—7. Flowers dark purple in axillary racemes.

Ground-nut. Wild Bean.

24. PHASEOLUS. Linn.

Calyx campanulate, bilabiate; upper lip 2-toothed; lower one 3-parted. Corol papilionaceous. Keel, stamens and style spirally twisted or rarely incurved. Legume compressed or cylindric, 2-valved, many-seeded.—Leaves ternate.

Diadelphia. Decandria.

1. P. perennis Walt.: twining, pubescent; leafets ovate, acuminate, 3-nerved; racemes 1—3, axillary, paniculate, longer than the leaves; bracts minute; legumes pendulous, broad, falcate, mucronate.—P. paniculatus Mich.—Dolichos polystachyus Linn.

HAB. Dry woods. N. Y. to Car. W. to Miss. July. 21.—

Stem long. Panicle 6-10 inches long. Flowers purplish, large.

Standard large.

Wild Kidney-bean.

- 2. P. diversifolius Pers.: stem prostrate; leafets ovate, angular, 2—3-lobed; peduncles angled, longer than the leaves; flowers in heads; bracts ovate; legumes linear, terete, subpendulous, pubescent.—P. trilobus Mich.—Strophostyles angulosa Ell. Torr.—Glycine angulosa Muhl. in Willd.
 - HAB. Woods. N. J. to Car. Aug. @.—Stem prostrate and a little scabrous. Flowers 8—14 at the summit of a peduncle 4—6 inches long, purple. Seeds reniform-cylindrical.
- 3. P. helvolus Linn.: climbing or prostrate; leafets deltoid-oblong, subsinuate; peduncles longer than the leaves, 3-flowered at the top; wings expanding, very large; legume erect.—Strophostyles helvola Ell., Torr.
 - HAB. Sandy fields. N. Y. to Car. W. to Miss. July, Aug. 24.—Stem branching. Flowers purple.

P. rexillatus Linn.: stem prostrate, twining, somewhat hairy; leafets oblong-ovate; peduncles very long; flowers 5—7 in a head; standard large, emarginate; wings small; legume terete, hairy; seeds woolly.—Strophostyles peduncularis Ell.—Glycine peduncularis Muhl.

HAB. Woods. N. J. to Car. July. 21.—Stem prostrate or climbing. Flowers 5—7 on a common peduncle 6—7 inches long, large, pink and purple.—This species is credited to New-Jersey by Prof W. P. C. Barton and to Pennsylvania by Muhlenberg. It seems to me to be distinct from the preceding.

25. LUPINUS. Linn,

Calyx deeply bilabiate. Corol papilionaceous. Standard and wings reflexed; keel acuminate. Stamens monadelphous. Sheath entire. Style filiform, Stigma terminal, roundish, bearded. Legume coriaceous, oblong, compressed, obliquely torulose.

Diadelphia. Decandria.

L. perennis Linn.: herbaceous, perennial; root creeping; stem and leaves smoothish; leaves digitate; leafets 8-9, oblong, mucronate, villous beneath; flowers alternate, on pedicels; calyx without appendages; upper lip emarginate, the lower entire.

HAB. Sandy woods. Can. to Flor. W. to Miss. May, June. 21.—Stem a foot high, ascending, somewhat hairy. Flowers blue, in a terminal spike or raceme. Common Lupine.

26. CRAFORDIA. Raf. De Cand.

Calyx campanulate, 5-cleft; segments nearly equal. Standard large, reflexed; wings appressed, auriculate at base; keel obtuse, longer than the wings. Stâmens 10, diadelphous. Style filiform. Stigma punctiform, glabrous. Legume subdispermous, linear, torulose, striate. Seeds oblong-reniform. Plant twining. Diadelphia. Decandria.

C. bracteata Raf. De Cand.

Hab. Banks of the Susquehannah. Penn. Raf.—Plant twining. Leaves unequally pinnate; leafets sessile, oblong, mucronate. Peduncles longer than the leaves, somewhat spiked; bracts scariose, subulate, persistent, ciliate; flowers white.—This genus is said by De Candolle to be allied to Galega and Colutea, but differs from them as well as from Teprosia, by its 2-seeded legume.

SUBORDER II. CÆSALPINEÆ.

Petals imbricated in æstivation. Stamens periginous, mostly free.

27. GLEDITSCHIA. Linn.

Flowers by abortion imperfect or perfect. Sepals 3-4-5, equal. Petals as many as the sepals, arising from the tube of the calyx. Stamens as many as the sepals and opposite to them, or by abortion fewer. Style short. Stigma pubescent above. Legume compressed, 1 or many-seeded. Sceds compressed.

Dioecia. Hexandria.

G. triacanthos Linn.: branches spiny; spines thick, simple or triple and compound, leaves equally pinnate; leafets linear-oblong; legume compressed-flat, falcate, many-seeded.—G. triacanthos and brachycarpa Pursh.

Hab. Woods. N. J. to Car. W. to Miss. A tree sometimes attaining the height of 40 or 50 feet, with very long spines. Flowers in axillary racemes. Legume 10—12 inches long, many-seeded, the intervals between the cells of the seeds filled with a saccharine pulp. The tree is sometimes unarmed, when it forms the var. inermis of De Candolle.

Honey Locust.

28. GYMNOCLADUS, Lam.

Flowers by abortion dioecious. Calyx tubular, 5-cleft. Petals 5, equal, oblong, exserted from the tube. Stamens 10, included. Legume oblong, thick, pulpy within.

Dioecia. Decandria.

G. canadensis Mich:

Hab. Can. N. Y. S. W. to Arkansa. May, June. A middle sized tree. Leaves very large, bipinnate; leafets oval, acuminate, pubescent. Flowers white, in racemes. Leguma large, dark brown. Coffee Tree.

29. CASSIA. Linn.

Sepals 5, scarcely united at base, somewhat unequal. Petals 5, unequal. Stamens 10, free, unequal; 3 lower ones longer; 4 middle ones short and straight; 3 upper ones with abortive anthers. Anthers dehiscent at the apex.

Decandria. Monogynia.

1. C. marylandica Linn.: nearly smooth; leafets in 8 or 9 pairs, ovate-oblong, mucronate, equal; gland at the base of the petiole ovate; racemes axillary, many-flowered, shorter than the leaves; legume compressed, linear, hispid, at length smooth.

Hab. Banks of streams. N. Y. to Car. W. to Miss. July, Aug. 21.—Stem 3—4 feet. Flowers yellow, large, in axillary racemes, which appear paniculate at the summit of the stem. Medicinal Big. Mcd. Bot. i. 166.

Wild Senna.

2. C. fasciculata Mich.: nearly smooth; leafets in 8 or 9 pairs, oblong-linear, mucronate; gland near the middle of the petiole, sessile; fascicles lateral, many-flowered; petals and stamens of the same colour; legume smooth, curved, ascending.

HAB. Dry fields. N. Y. to Car. June-Aug. .-Flowers

yellow.

3. C. nictitans Linn: stem erect or pubescent, branched; leafets in 16—20 pairs, oblong-linear, obtuse, mucronate; gland on the petiole cup-shaped, on a slender foot-stalk; peduncles subaxillary, short, few-flowered; flowers pentandrous; legume pubescent.

somewhat irritable like the mimosa or sensitive plant.

Wild Sensitive Plant.

4. C. chamæcrista Linn.: smoothish; leafets in 10—15 pairs, oblong-linear, mucronate; gland sessile on the petiole; peduncles 2—3-flowered, above the axils, shorter than the petiole; 2 of the petals spotted; legume pubescent.

HAB. Sandy places. N. Y. to Car. W. to Miss. June—Aug.
S.—Stem a foot or more high. Flowers yellow, sometimes the

base of all the petals spotted.

30. CERCIS. Linn.

Calyx 5-toothed, gibbous at base. Petals 5, with claws, subpapilionaceous, all distinct; wings large. Stamens 10, free, unequal. Legume oblong, compressed, 1-celled, many-seeded; upper seminiferous suture margined. Seeds obovate.

Decandria. Monogynia.

C. eanadensis Linn.: leaves roundish-cordate, acuminate, villous at the axils of the nerves; legumes on short foot-stalks; flowers in small fascicles.

Hab. Woods. Can. to Car. W. to Miss. April. A small tree with greyish bark. Flowers appearing before the leaves, of a dark rose colour. Judas Tree. Red Bud.

ORDER XXXVI. AMYGDALEÆ. Lind.

Calyx 5-toothed, deciduous, the odd lobe superior. Petals 5. Stamens about 20, in æstivation curved inwards; anthers

erect, 2-celled. Torus lining the tube of the calyx. Ovary superior, solitary, simple, one-celled; styles terminal, with a groove on each side; stigma reniform. Fruit a drupe. Seeds usually solitary, suspended from the funiculus, which arises from the base of the cavity, but coheres with its sides. Embryo straight, with the radicle next to the hilum; albumen none; cotyledons thick.

Trees or shrubs. Leaves simple, alternate, stipulate. Hy-

drocyanic acid present in the leaves and kernel.

1. PRUNUS. Linn.

Drupe ovate or oblong, fleshy, very smooth, covered with greyish dust; putamen compressed, acute at both ends, subsulcate at the margin, elsewhere smooth.—(Plum.)

Icosandria. Monogynia.

1. P. maritima Willd.: peduncles solitary; leaves ovate-oblong, acuminate, doubly serrate; fruit dark purple.—P. acuminata Mich.

Hab. Sea coast. N. J. to Car. May. b.—Fruit about the size of the common garden plum, dark purple. Beach Plum.

- 2. P. Americana Marsh.: leaves oblong-oval, acuminate, sharply serrate, veined; umbel 2-4 flowered.—P. nigra Muhl. not of Ait.
 - HAB. Penn. Aug. 7.—A tree 8—15 feet high. Flowers white. Fruit reddish-yellow. By cultivation the fruit becomes large and luscious. Dr. Darlington, who notices this species in his Florula Cestrica, thinks it has not been described by any one except Marshall.—Abustrum Americanum p. iii.—He remarks, "I certainly should not have expected to find it under the specific name nigra, if Dr. Muhlenberg's catalogue had not directed my attention to that species, by the subjoined English name 'Vellow Plum.' I think it cannot be the P. nigra of Aiton, Willdenow, Persoon, &c. for they seem evidently to refer to a species of cherry, properly so called. This species, though clearly distinct, approaches nearer to the Chicasa plum than to any other which I have seen."
- 3. P. mollis Torr.: younger branches leaves and peduncles pubescent; umbels sessile, 2—3 flowered; leaves ovate, long-acuminate, doubly dentate-serrate; stipules setaceous, denticulate; calyx nearly smooth; segments linear-lanceolate, serrate.

Hab. Mass.—A small tree. Flowers large. Fruit oval, nearly black when ripe.

4. P. spinosa Linn.: branches spiny; peduncles solitary, calyx campanulate; lobes obtuse, longer than the tube; leaves obovate-elliptic or ovate, pubescent beneath, coarsely and doubly dentate; fruit globose.

HAB. Hedge rows. Penn. 5.—Introduced. Pursh.

Black Thorn or Sloe.

2. CERASSUS. Juss.

Drupe globose or umbilicate at base, fleshy, very smooth, destitute of grey powder; nucleus subglobose, smooth.-(Cherry.) Icosandria. Monogynia.

- * Flowers umbelled; pedicels 1-flowered, arising from the buds.
- 1. C. pumila Mich.: striate; branches virgate; flowers subumbelled, peduncled; calyx short, campanulate; leaves obovate-oblong, erect, glaucous beneath, serrulate, smooth; fruit ovate.—Prunus pumila Lam.
 - HAB. Banks of streams. Mass. to Virg. May. b.—Shrub 2-3 feet high. Fruit small, ovate, red, acid.
- 2. C. pygmæa De Cand.: unarmed; umbels sessile, few-flowered; leaves ovate-elliptic, somewhat acute, smooth on both sides, sharply serrate, attenuate, with two glands at the base.—Prunus pygmau Willd.

HAB. New-England, N. Y. and Penn. May. 5. - Shrub 3-4 feet high. Fruit black, of an indifferent taste, and about the size of a large pea.

- 3. C. pubescens De Cand.: umbels sessile, few-flowered; peduncles and calyx pubescent; leaves short-oval, serrulate, mostly with two glands at base; fruit globose. - Prunus pubescens Pursh. - P. spharocarpa Mich. -P. littoralis Big.
 - Sandy shores. N. Eng. Penn. May. 5.-Shrub 2-4 HAB. feet high. Fruit shortly pedunculate, purplish, sour and astringent.—The description of Dr. Bigelow's P. littoralis, does not differ materially from the above, except in the fruit, which is large, (sometimes an inch in diameter) globular, eatable, with the flavor of the common plum. It may be distinct.

Sand Cherries.

4. C. nigra De Cand.: unarmed; umbels solitary, sessile, fewflowered; leaves deciduous, ovate, acuminate, unequally and acutely serrate, smooth on both sides; petioles with two glands; segments of the calvx obtuse, glandular on the margin; petals obovate.-Prunus nigra Ait.

HAB. Mountains. Can. N. Y. and N. Eng. June. b.—Shrub 6-8 feet high.

5. hyemalis Mich.: flowers umbelled, smooth; segments of the calyx lanceolate; leaves oblong-oval or oboval, abruptly acuminate; fruit subovate.

HAB. Can. Virg. and Car. May, b .- Fruit small, black, extremely astringent, but eatable in winter. Pursh.

Black Choke Cherry.

6. C. depressa De Cand.: branches angular, depressed, prostrate; umbels few-flowered, sessile, aggregated; leaves cuneate-lanceolate, remotely serrate, smooth, glaucous beneath; fruit ovate. - C. pumila Mich. not Prunus pumila Linn .- P. depressa Pursh.

- HIAB. Banks of streams. Can. to Virg. May. b.—A low shrub with spreading branches. Fruit black, small and agreeably tasted.
- 7. C. borealis Mich.: flowers sub-corymbed; pedicels clongated; leaves oval-oblong, acuminate, membranaceous, glabrous, crosely denticulate, smooth; fruit subovate.—Prunus borealis Pursh.
 - HAR. Mountains. Can and N. S. May. 5.—A small tree with delicate leaves, and hard and fine grained wood. Fruit small, red, agreeable to the taste, but astringent. Pursh.

 Choke Cherries.
 - ** Flowers racemose, arising from the branches.
- 8. C. pennsylvanica De Cand.: umbels subsessile, aggregated, at length becoming paniculate; leaves oblong-lanceolate, acuminate, smooth, with two glands at the base; branches punctate.—Prunus lanceolata Willd.—P. pennsylvanica Ait.
 - HAB. Woods. N.S. N. to Subarctic America. April, May. ?. —A sizeable tree, resembling Prunus cerasus. Fruit small, red and astringent.—Muhlengberg and Torrey have, I think without reason, confounded this species with P. boralis. Both are retained by De Candolle, and they are even arranged by him under different sections of his genus Cerasus.
- 9. C. rirginiana Mich.: racemes erect, elongated; petals orbicular; leaves oblong, acuminate, dentate, smooth on both sides; petioles with 2-4 glands; fruit dark red.—Prunus rirginiana Linn.
 - HAB. Woods. Can. to Flor. W. to Miss. N. to Arc. Amer. May. 5.—A large tree with blackish rough bark and very dense wood, resembling mahogany, which is much used by cabinet makers. Flowers white, in long simple racemes. Fruit purplish-black.
- 10. C. serotina De Cund.: racemes loose, at length pendulous; leaves deciduous, oval or obovate, with a short acumination, opaque, doubly and very sharply serrate; midrib bearded on each side towards the base; petiole with two glands.—Prunus scrotina Willd.
 - the preceding in its bark and wood. The fruit is dark red and astringent. According to Dr. Torrey, this species has been confounded with the preceding by Michaux and other botanists, and both are incorrectly described by Wildenow and Pursh.
- 11. C. obovata Beck: racemes spreading; leaves obovate, acute, mostly obtuse at base and sometimes cordate, sharply serrate, smooth, except the axils of the lower veins beneath; petioles mostly with two glands.—Prunus obovata Big.—P. serotina Pursh not of Willd.?
 - HAB. Margins of woods. Can. to Car.? May. p.—A shrub 3—4 feet high, rarely rising to the height of a small tree. Fruit small, red and bitter.—I have long been acquainted with this shrub which is certainly distinct from C. serotina as above described. It may be identical with Prunus hirsutus of Elliott.
 - 12. C. canadensis De Cand.: flowers in racemes; leaves deciduous,

without glands, broad-lanceolate, acutely serrate, rugose, pubescent on both sides.—Prunus canadensis Willd.

HAB. In Penn. Muhl. This is supposed by Pursh to be a mere variety of P. hiemalis of Mich.

ORDER XXXVII. ROSACEÆ. Lind.

Calyx 4 or 5-lobed, with a disk either lining the tube or surrounding the orifice; the fifth lobe next the axis. Petals 5. Stamens indefinite; anthers 2-celled. Torus thick, lining the tube of the calyx, bearing at its margin the stamens and petals, and on its surface the carpels. Ovaries superior, solitary or several, 1-celled; ovules 2 or more, suspended; styles persistent, lateral; stigmas usually simple and emarginate on one side. Fruit either 1-seeded nuts, or acines, or follicles containing several seeds. Seeds suspended, rarely ascending. Embryo straight, with a taper short radicle next to the hilum, and flat cotyledons; albumen, if present, fleshy.

Herbs or shrubs. Leaves simple or compound, with 2 stipules at base.

1. SPIRÆA. Linn.

Calyx 5-cleft, persistent. Petals 5. Stamens 10-50. Carpels 1-many, distinct, rarely united at base, short apiculate, sessile, rarely stiped. Seeds 2-6.

Icosandria. Di-Pentagynia.

* Shrubby. Leaves lobed and toothed.

1. S. opulifolia var. tomentella De Cand.: leaves ovate, 3-lobed, doubly toothed and crenate, petioled, smooth; corymbs terminal, hemispherical, pedancled; flowers numerous (30-40) trigynous; pedicels pubescent; lobes of the calyx ovate, obtuse, pubescent; capsules large, inflated, compressed; seeds obovate, shining, yellow.—S. opulifolia Pursh. Mich. Torr.

Hab. Banks of streams. Can. to Geor. W. to Miss. June, July. 5.—A shrub 3—6 feet high. Flowers white, in a corymb.

—According to De Candolle the Linnwan S. opulifolia has the pedicels and calyx smooth.

Nine-bark. Hard-hack.

** Shrubby. Leaves entire or toothed.

2. S. hypericifolia De Cand.: leaves obovate-oblong, 3—4 nerved, entire or dentate, glabrous or slightly pubescent; nerves pinnate; flowers in peduncled corymbs or sessile umbels; pedicels smooth or pubescent; segment of the calyx ascending.

b. plukenetiana De Cand.: leaves entire, smooth, corymbs sessile.
 S. hypericifolia Linn. Pursh. Muhl.

- d. crenata De Cand.: leaves obovate, crenulate at the apex, somewhat pubescent; corymbs-sessile; pedicels slightly pubescent.—S. crenata Linn. Muhl.
- HAB. var. b. Dry swamps. Can. and N. Y. May. 7.

 Pursh. var. d. N. Y. Muhl.—This species according to De
 Candolle is very variable, and includes several which have heretofore been considered distinct. It is sometimes cultivated in
 our gardens, and was formerly known by the name of Hypericum
 frutex, but I believe, it has not been found native; and the only
 authorities for the varieties here mentioned as American plants,
 are those above given.
- 3. S. corymbosa Raf.: leaves oblong-obovate, incisely toothed, pubescent beneath; corymb terminal, pedunculate, compound, fastigiate, somewhat leafy; flowers pentagynous.—S. corymbosa Muhl.? S. chamædrifolia Pursh.?
 - 11 As. Alleghany mountains. Ref. May, June. b.—Stem 18 inches high, slightly pubescent. Leaves nearly smooth above, pale beneath. Flowers pale rose-colour, in a compound pedunculatecorymb.—I adopt the above description, &c. from Torrey's Flora; though De Candolle still retains Pursh's plant as a variety of the Linnæan S. chamædrifolia.
- 4. S. salicifolia Linn.: stem and peduncles glabrous; leaves lanceolate, acutely serrate, smooth; racemes in dense terminal compound panicles; flowers pentagynous; segments of the calyx ovate, spreading.—S. alba Ehrh.
 - Hab. Meadows. Can. to Car. N. to Arc. Amer. July. 5.—
 Stem 2—4 feet high. Flowers white.—This species varies somewhat in the form of the leaves.
- 5. S. tomentosa Linn.: stem and peduncles reddish tomentose; leaves ovate-lanceolate, unequally serrate, densely tomentose beneath; racemes terminal, compound, crowded; flowers pentagynous; segments of the calyx tomentose on the outer side, reflexed; capsules 5, distinct.
 - HAB. In low grounds. Can. to Car. July, Aug. 5.—Stem 2—3 fect high. Flowers small, pale purple, in a very dense elongated conical raceme.

 Hard-hack.

*** Herbaceous. Leaves pinnate.

6. S. aruncus var. americana Pursh: leaves twice or thrice pinnate, shining; leafets acuminate, lateral ones lanceolate, terminal one ovate; spikes slender, in an oblong panicle; flowers very numerous, trigynous, perfect.—S. aruncus Ell.

HAB. Mountains. N. Y. to Geor. W. to Miss. June. 21.—Stem 4—6 feet high. Flowers white, small, in slender terminal spikes.

7. S. lobata Jacq.: leaves palmate-pinnate, smooth, lower ones bipinnate; terminal leafet much larger and 7-lobed; lateral leafets 3-lobed;

stipules reniform; corymbs proliferous; flowers with 3--5 short styles; sepals reflexed.—S. palmata Linn.

HAB. Penn. to Car. June. 21.-Flowers rose-colour, in a com-

pound cyme.

2. GILLENIA. Manch. Nutt.

Calyx tubular-campanulate, contracted at the mouth, 5-cleft. Petals 5, linear-lanceolate, somewhat unequal, coarctate at the claws. Stamens 10—15, included. Styles 5, contiguous. Stigmas capitate. Capsule 5-celled; cells 2-seeded. Cosandria. Di-Pentagynia.

1. G. trifoliata $M\alpha nch$: leaves ternate; leafets lanceolate, serrate, subequal; stipules small, linear, entire; flowers in loose terminal pa-

nicles, large.—Spira trifoliata Linn.

HAB. Shady woods. N. J. to Geor. W. to Miss.; rare. June.
21.—Stem 2—3 feet high. Flowers white, in a few flowered terminal panicle. Petals long. Medicinal, emetic, &c.—Bart. Veg. Mat. Med. i. 69. Big. Med. Bot. iii. 11.

Indian Physic. Ipecac.

- 2. G. stipulacca Nutt.: radical leaves pinnatifid; stem leaves ternate; leafets incisely serrate; stipules foliaceous, ovate, incisely toothed and clasping; flowers in loose terminal panicles, large.—Spiraca stipulata Muhl.
 - Hab. Western part of N. Y. W. to Miss. S. to Car. June. 21.—It resembles the former, but can readily be distinguished by its large clasping stipules. I have fine specimens gathered in the western part of N. Y. by David Thomas, Esq.

3. DRYAS. Linn.

Calyx 8—9 parted, naked without; tube somewhat concave. Petals 8—9. Stamens many. Carpels many, crowned by a terminal style, at length terminating in a bearded plumose awn. Seed ascending. Icosandria. Polygynia.

D. integrifolia Vahl.: leaves very entire, acute at base.—D. tenella Pursh.

IIAB. On the white hills of N. H. July. 21.—Peduncles 1-flow-ered.—Scarcely differs from D. octopetala found in the north western part of Canada.

4. GEUM, Linn.

Calyx with the tube concave; 10-cleft; the alternate segments smaller (or limb 5-cleft and 5-bracted.) Petals 5.

Stamens many. Carpels in a head, awned; awn naked or bearded, mostly jointed.

Icosandria. Polygynia.

1. G. strictum Ait.: hairy; leaves all interruptedly pinnate; the terminal leafet larger; leafets ovate, dentate; stipules ovate, incised; calyx with 5 alternate segments, linear and short; flowers erect; petals roundish, a little longer than the segments; awns naked, uncinate. —G. canadense Murr.

HAB. Swamps. Can. and N. S. Aug. 21.—Stem 2 feet high. Flowers large, yellow. Yellow Avens.

- 2. G. virginianum Linn.: pubescent; radical lower stem leaves ternate; the upper lanceolate; stipules ovate, nearly entire; flowers erect; petals shorter than the calyx; awns uncinate, naked, hairy and twisted at the summit.
 - Hab. Shady woods. Can. to Car. W. to Miss. June, July. 21.—Stem 2 feet high, erect. Lower leaves large, sometimes quinate. Flowers yellowish-white, on long peduncles.

Virginian Avens.

3. G. album Willd.: pubescent; radical leaves pinnate; stem leaves ternate; the upper one simple, 3-cleft; lower stipules incised; flowers erect; petals as long as the calyx; awns uncinate, naked, hairy at the summit.—G. canadense Jacq.

Hab. Banks of streams. Can. to Car. June, July. 21.—Stem 2 feet high. Flowers white, on short peduncles.—De Candolle thinks it may be a variety of the former. White Arens.

4. G. rivale Linn.: pubescent; stem simple, 1—4 flowered; radical leaves interruptedly pinnate; lobes oboyate, doubly-serrate; stem leaves 3-lobed; lobes acute; flowers nodding; petals as long as the calyx; awns plumose, nearly naked at the summit, minutely uncinate.

Hab. Moist places. Can. and N. S. May, June. 2f.—Stem
 18 inches high. Flowers large, terminal, several on each branch, dark purple.

Water Avens.

5. G. peckii Pursh.: somewhat hairy; stem few-flowered; radical leaves reniform, incisely toothed and somewhat lobed; petioles elongated, with minute leafets; petals roundish, longer than the calyx.

HAB. White hills, N. H. July, Aug. 21.—Stem 8—10 inches high. Radical leaves on long petioles. Flowers yellow, middle sized.

6. G. geniculatum Mich.: stem branched above; stem leaves sessile, 3-parted; stipules entire; flowers somewhat panicled; petals obcordate-cuneate; awns hairy, geniculate in the middle.

HAB. Canada. Mich. An obscure species.

5. COMAROPSIS. Rich.

Calyx with the tube turbinate, the limb 5-cleft, not bracted. Petals 5, without claws. Stamens numerous. Carpels small,

with an elongated filiform style at the apex. Acines dry, not united at base. Icosandria. Polygynia.

C.fragarioides De Cand.: carpels smoothish; peduncles branched, 3-flowered; petals thrice as large as the calyx; leaves ternate; leafets wedge-form, sessile.—Dalibarda fragarioides Mich. Pursh. Torr.

HAB. Woods. Can. to Car. May. 21.—Root creeping. Scapes 3—4 inches high. Leaves on long petioles, ternate, rarely quinate, incisely serrate. Flowers 3—5, yellow. Dry Strawberry.

6. RUBUS. Linu.

Calyx flat at base, naked, 5-cleft. Petals 5. Stamens many, inserted into the calyx. Berry composed of many cohering fleshy carpels or acines. Receptacle nearly dry.

Icosandria. Polygynia.

- * Leaves pinnate or ternate, white-downy beneath.
- 1. R. strigosus Mich.: stem terete, strongly hispid; leafets in threes, or pinnate in fives, oval, obtuse at the base, marked with lines and whitish-downy beneath, the terminal one often subcordate; peduncles somewhat 3-flowered and with the calyx hispid; flowers in terminal racemes; petals obovate, longer than the calyx.—R. pennsylvanicus Iam.
 - Hab. Rocky hills. Can. to Virg. N. to Subarc. Amer. May. b.—Stem upright, without prickles, but covered with stiff bristles, of a reddish colour. Flowers white. Fruit red, richly flavoured.

 Red Raspberry.
- 2. R. occidentalis Linn.: somewhat smooth; stem terete, glaucous, armed with strong recurved prickles; leaves of the sterile branches pinnate, of the fertile ones ternate; leafets ovate, coarsely serrate, hoary-tomentose beneath; petioles terete; flowers in terminal racemes; lobes of the calyx lanceolate-linear, tomentose at the apex; petals obovate-wedgeform, 2-lobed, shorter than the calyx.

Hab. Side hills. Can. to Car. N. to Subarc. Amer. May— July. 5.—Stem 4—5 feet high. Flowers white. Fruit roundish, black and reddish. Wild Raspberry.

3. R. idaus Linn.: villose; stem terete, with slender recurved prickles; leaves of the sterile branches pinnate, of the fertile ones ternate; leafets rhombic-ovate, acuminate, white and very downy beneath; petioles channelled; flowers somewhat corymbed; lobes of the calyx ovate-lanceolate, white-tomentose, submucronate; petals obovate-wedgeform, entire, shorter than the calyx.

HAB. Hedges and woods. Can to Penn. Pursh. June. 7.—Stem
 2—4 feet high. Flowers white, panicled. Fruit red. It is said

to have several varieties.

** Leaves palmate, with 3-5 leafets.

† Frutescent.

4. R. setosus Big.: stem strongly hispid; branches setose at the apex; leaves ternate or quinate, on long petioles; leafets obovate-wedgeform, simply serrate, smooth, of the same colour on both sides; flowers in racemes, with bristly pedicels; petals obovate-wedgeform, longer than the ealyx.

HAB. Swamps. Can, and Mass. Big. June, b.—Flowers white. Fruit red. Bristly Raspberry.

5. R. cuneifolius Pursh: stem petioles and peduneles tomentose; prickles few, recurved; leaves ternate and quinate, palmate; leafets wedgeform, ovate, entire at the base, subplicate, tomentose beneath; flowers in terminal panicles; pedicels divaricate, naked, 1-flowered.—R. parviflorus Walt.

Hab. Sandy fields. N. J. to Car. June. 5.—Stem 2—3 feet high. Flowers white: Fruit black, ovate, juicy, eatable.

- 6. R. frondosus Big.: stem prickly, erect; leaves ternate or quinate; pubescence simple; racemes leafy, about ten-flowered; petals orbicular.
 - HAB. Road sides, near Boston. Big. May, June. b.—Flowers white, large. Fruit black, agreeable.—Approaches R. villosus, and has probably been confounded with it, but differs, according to Dr. Bigelow, in habit, and in having the pubescence simple, the flowers in leafy racemes, and the petals orbicular-ovate.

 Leafy Raspberry.
- 7. R. villosus Ait.: pubescent, hispid and prickly; leaves ternate, rarely quinate-palmate, villose; leafets ovate, doubly serrate; flowers in lax panicles; lobes of the calyx short-acuminate; pedicels solitary.

Hab. Fields and hedges. Can. to Car. June. 2.—Stem 4—6 feet high. Flowers white, 20 or more in a raceme. Fruit large, black.

High Blackberry.

8. R. hispidus Linn.: stem sarmentose-procumbent, and with the petioles and peduncles strongly hispid; prickles few, recurved; leaves in threes or fives, palmate; leafets unequally dentate, smoothish, wedgeform at base; pedicels solitary, elongated; petals obovate.—R. trivialis Mich.—R. procumbens Muhl.—R. flagellaris Willd. (According to Sprengel.)—R. sempervirens Big.?

HAE. Barren grounds. Can. to Car. May, June. b.—Flowers white. Berries large, black and well flavoured.—Sprengel's views concerning the identity of the above supposed distinct species, appear to me to be entirely correct. Low Blackberry. Develory.

9. R. canadensis Linn.: stem purple, smoothish; leaves in threes and fives, palmate; leafets lanceolate, acutely serrate, naked on both sides; stipules linear, subaculeate; pedicels elongated, 1—3-flowered; calyx 5—7-cleft.— C_{ij} lactis montana Raf.

HAB. Woods and swamps. Can. to N. J. June. 5.—Stem creeping. Flowers white. Fruit small, dark red, well tasted.

tt Herbaceous.

10. R, saxatilis var. canadensis Mich.: herbaceous, pubescent; stems creeping; leaves ternate; leafets rhombic, acute, incisely dentate, naked, the terminal one petioled; flowers somewhat in threes; pedicels elongated.

HAB. Mountains. Can. to Vir. N. to the sources of the Mississippi. June, July. 24.—Flowers white. Fruit small, black.

11. R. acaulis Mich.: stem herbaceous, very short, unarmed, 1-flowered; leaves ternate-palmate; leafets ovate, rhomboidal, coarsely scrate; peduncle somewhat pubescent; lobes of the calyx lanceolate-linear, somewhat acute, with the oblong petals much shorter; filaments dilated; styles subclavate, approximate.—R. pistillatus Smith.

Hab. Can. and N. Y. W. to N. W. coast. June, July.21.— Flowers rose-colour. Fruit red.—Resembles R. arcticus.

12. R. agopodioides De Cand.: stem herbaceous, somewhat pubescent, unarmed; leaves ternate and quinate, palmate, very smooth; leafets lanceolate, acutely and doubly serrate, ciliate, many-nerved; flowers terminal, in pairs, peduncles elongated, pubescent; lobes of the calyx lanceolate, acute, shorter than the corol.—R. saxatilis Big. sec. De Cand.

HAB. White mountains, N. H. June. G.-Stem a foot high. Flowers white.

13. R. obovalis Mich.: stem becoming a little woody, hispid with stiff lairs; leaves ternate; leafets obovate-roundish, serrate, naked; racemes subcorymbed, few-flowered; bracts ovate; pedicels elongated.

Hab. Mountain swamps. N. Y. to Car. June, July. 21.—

Berries with only a few large grains, black and sweet.—Allied to R. saxatilis.

- *** Leaves simple, lobed, but neither pinnate nor palmate.
- 14. R. parciflorus Nutt.: stem suffruticose, unarmed; leaves simple-palmate lobed; peduncles about 3-flowered; lobes of the calyx ovate, acuminate, villose; petals ovate-oblong, shorter than the calyx.

 HAB. Island of Michilimackinac. Nutt.—Flowers small, white.
- 15. R. chamæmorus Linn.: root creeping; stem simple, 1-flowered, somewhat pubescent, unarmed; leaves somewhat kidney-form, plicate, denticulate, lobes rounded; flowers monoecious; lobes of the calyx lanceolate subentire, longer than the corol; petals obovate.

HAB. High mountains. Can. and N. Eng. N. to Arctic Amer. May, June. 21.—Flowers white. Fruit yellow or amber coloured.

16. R. odoratus Linn.: stem fruticose, erect; petioles, peduncles and calyx glandular-pilose; leaves 5-lobed, unequally dentate; flowers sub-

corymbed; lobes of the calyx ovate, long acuminate, shorter than the

corol; petals nearly round.

Hab. Rocks. Can. to Geor. June. 5.—Stem 3-4 feet high.

Flowers large, purple. Fruit large, yellow, well flavored, but not abundant.

Flowering Raspberry.

7. DALIBARDA. Linn.

Calyx with the tube short concave; limb 5—6-cleft, naked without; lobes dentate. Petals 5. Stamens many, deciduous. Ovaries 5—10, with short terminal styles. Acines few, dry, adhering to the calyx. Icosandria. Polygynia.

D. repens Linn.: stem creeping; leaves simple, cordate, crenate; stipules linear-setaceous; peduncles 1-flowered; calyx smooth without, reflexed.—F. riolxoides Mich.—Rubus dalibarda Linn.

HAB. Mountains. Can. and N. S. June. 21.—Stems herbaceous, rooting and creeping. Leaves on long petioles. Flowers

solitary, white, on long nearly radical peduncles.

8. FRAGARIA. Tourn.

Calyx with the tube concave, 5-cleft, and with 5 bracts without, (or 10-cleft.) Petals 5. Stamens many. Carpels naked, fixed on a long pulpy deciduous receptacle. Style lateral. Icosandria. Polygynia.

1. F. virginiana Linn.: leafets broad-oval, smoothish above, the lateral ones distinctly petioled; hairs of the petioles spreading, of the peduncles appressed; peduncles and petioles of the length of the leaves; receptacle pendulous; styles long.

IIAB. Fields. From Arctic America to Florida, and W. to the

Miss. May. 21.—Stem short. Flowers white.

Wild Strawberry.

2. F. canadensis Mich.: larger; leafets broad-oval, lateral ones manifestly petioled; pedicels long, recurved-pendulous; receptacle of the seeds globose, favose-scrobiculate, villous.

HAB. Sandy woods. Can. and N. S. N. to Hudson's Bay. April, May. 21.—Much larger than the former and apparently distinct, although generally considered identical. I have fine specimens from the vicinity of Little Falls, N. Y.

Mountain Strawberry.

3. F. resca Linn.: stoloniferous; lobes of the leaves plicate, thin, pilose beneath; fruit pendulous; sepals reflexed after flowering; peduncles with appressed hairs.

HAB. Fields. N. S. April, May. 21.-Introduced. There

are a great many cultivated varieties of this species.

Common Strawberry.

9. POTENTILLA. Linn.

Calyx with the tube concave; limb 4—5 cleft, 4—5-bracted without (or 8—10-cleft.) Petals 4—5. Stamens many. Carpels many, roundish, rugose, naked, fixed to a small dry receptacle. Icosandria. Polygynia.

* Leaves ternate-palmate.

1. P. norregica Linn.: hirsute; stem erect, dichotomous above; leaves ternate-palmate; leafets lanceolate or obovate, simply and doubly serrate; stipules lanceolate; flowers numerous, subcorymbed and axillary; petals obcordate, shorter than the calyx; lobes of the calyx lanceolate, acute.

Hab. Old fields. Can. to Car. N. to Arc. Amer. June—Aug.

—Stem 8—10 inches high. Flowers yellow. Stipules large.
Perhaps introduced. Norway Cinquefoil.

2. P. hirsuta Mich.: stem erect, hirsute, dichotomous above; leaves ternate, petiolate; leafets obovate-wedgeform, deeply dentate; stipules lanceolate, subentire; flowers axillary, subcorymbed; petals oblong-linear, shorter than the calyx; carpels rugulous.—P. morisoni De Cand.

Hab. Western part of N. Y. N. to Subarc. Amer. July. . Stem very hairy. Flowers few, in a terminal dichotomous panicle, yellowish-white.—Perhaps only a variety of the former.

3. P. tridentata Ait.: smoothish; stem ascending, dichotomous; leaves ternate-palmate; leafets obovate-wedgeform, coriaceous, 3-toothed at the summit, pubescent beneath; stipules lanceolate, acuminate; corymb loose, few-flowered; petals oblong-obovate, longer than the calyx.

HAB. Mountains. Arc. Amer. to Car. June, July. 21. Stem 3-6 inches high. Flowers white.

** Leaves digitate.

4. P. canadensis Linn.: silkly villous; stem procumbent and ascending, somewhat branched; leaves quinate-palmate; leafets obovate-wedgeform, acutely dentate; stipules lanceolate, somewhat obtuse; peduncles solitary, elongated; lobes of the calyx linear-lanceolate, acute, nearly equalling the corol; petals obovate, entire.

Hab. Fields and woods. Can. to Car. April, May. 21.—Stem 3-8 inches high. Flowers yellow. Receptacle hairy.

Five-finger.

5. P. simplex Mich.: stem sarmentose, simple, hairy; leaves quinate, petioled; leafets ovate-lauceolate, acutely toothed, a little hairy beneath; stipules lanceolate, entire; peduncles lateral, solitary, elongated, 1-flowered; lobes of the calyx lanceolate-linear, mucronate, a little shorter than the roundish obcordate petals.—P. sarmentosa Willd.—P. caroliniana Poir.

- 11AB. Fields and woods. Can. to Car. May—Aug. 7.—Flowers yellow. Is not this a mere variety of the last?
- 6. P. argentea Linn.: stem ascending or erect, tomentose; leaves quinate-palmate; leafets obovate-wedgeform, incised, revolute on the margin, white and tomentose beneath; flowers numerous, corymbed; lobes of the calyx lanceolate, shorter than the corol.
 - b. dentata De Cand.: leafets subentire, 3-4 toothed at the apex, tomentose beneath.-P. cinerea Raf.
 - HAB. Fields. Can, and throughout the N. S. June—Sept. 24.
 —Stems 4—10 inches long. Leaves green above. Flowers yellow.
 Silvery Cinquefoil.

*** Leaves pinnate.

- 7. P. fruticosa Linn.: stem fruticose; leaves pinnate, hirsute; leafets oblong-lanceolate, very entire, approximate; stipules lanceolate, membranaceous, acute; flowers in corymbs, large; petals longer than the calyx.—P. fruticosa and P. floribunda Pursh.
 - Hab. Margins of swamps. N. S. N. to Arc. Amer. W. to Rocky mountains. June. η.—A strub 2 feet high, much branched and hairy. Flowers large, yellow.—P. floribunda of Pursh, differs only in having the leaves and flowers more numerous.
- 8. P. supina Linn.: stem decumbent, herbaceous, dichotomous; leaves pinnate; leafets obovate or oblong, somewhat glabrous, more or less toothed; peduncles axillary, solitary, 1-flowered; segments of the calyx triangular-lanceolate; petals as long as the calyx.

Hab. Overflowed banks of streams. Can. and Penn. W. to Miss. June -Aug. . .-Flowers small, yellow.

9. P. anserina Linn.: stem filiform, rooting; leaves interruptedly pinnate; leafets ovate-oblong, incisely and acutely serrate, smooth above, silky beneath; stipules many-cleft; peduncles as long as the leaves, axillary, solitary; lobes of the calyx lanceolate, entire; petals obovate, longer than the calyx.

Hab. Wet meadows. N. S. N. to Arc. Amer. Junc. 21.—

Stems long, reddish. Flowers yellow, on long axillary peduncles.

Silver-weed. Wild Tansey.

- 10. P. pennsylvanica Linn.: whole plant white tomentose; stem herbaceous erect; leaves interruptedly pinnate; cauline ones 3-lobed, lobes oblong-ovate, deeply dentate; stipules lanceolate, somewhat laciniate; flowers in corymbose panicles; inner lobes of the calyx triangular-lanceolate, outer ones oblong-lanceolate, as long as the corol; petals obcordate; receptacle pilose; carpels rugulous.—P. arguta Lehm. not of Pursh.
 - HAB. N. S. N. to Arctic Amer. June. 21.—Stem 1—2 feet high. Flowers pale yellow.
- 11. P. arguta Pursh: erect, simple, pubescent; leaves pinnate; leafets ovate, sharply dentate, outer ones larger; stipules rhomboidal,

incised; flowers terminal, in a crowded corymb — P. confertiflora Torr. Fl. Lchm.—P. pennsylvanica Torr. in Ann. N. Y. Lyc. ii. 197.—Geum

agrimonoides Pursh .- Bootia sylvestris Big.

Hab. N. S. N. to Arc. Amer. June, July. 21.—Stems many, 3 feet high, erect, nearly simple, branched above and with the petioles, peduncles and calyx covered with a whitish and glandular pubescence. Leaves unequally pinnate, with the leafets unequally and doubly serrate, and sometimes lobed. Flowers erect, at first in dense corymbs, at length paniculate. Calyx with the five alternate segments smaller. Petals pale yellow. Styles lanceolate, naked.—Richardson's Appendix to Franklin's Jour. p. 20.

12. P. comarum De Cand.: root creeping; stem ascending, leaves pinnate; upper ones ternate; leafets lanceolate, acutely serrate; petals lanceolate, acuminate, much shorter than the calyx.—P. palustre Lehm. Torr.—Comarum palustre Linn.

Hab. In swamps. N. S. N. to Arctic America. June. 21.— Stem 18 inches high. Flowers large, purple, on the upper part of the stem. Marsh Cinquefoil.

10. SIBBALDIA. Linn.

Calyx 10-cleft, with the alternate segments narrower. Petals minute. Stamens and carpels often 5. Styles 5, proceeding laterally from the germ. Seeds 5, clustered in the bottom of the calyx.

Pentandria. Pentagynia.

S. procumbens Linn.: leaves ternate; leafets cuneate, tridentate, smooth above, hairy beneath; flowers corymbed; petals lanceolate, acute, about as long as the calyx.

HAB. High mountains. Can. and Ver. b.—A small procumbent plant with the habit of *Potentilla tridentata*. Flowers yellow.

11. AGRIMONIA. Linn.

Calyx inferior, 5-cleft, with a lobed calicle at its base. Petals 5. Stamens 15. Acines 2, in the bottom of the calyx. Icosandria. Di-Pentagynia.

1. A eupatoria Linn.: hairy; leaves interruptedly pinnate; leafets oblong-ovate, crenate-dentate, the terminal one petioled; spike virgate, many-flowered, terminal, long and slender; tube of the calyx bell-shaped, with spreading bristles near the middle; petals twice as long as the calyx; fruit distant, turbinate, hispid, smooth at base.

HAB. Woods and hedges. Can. to Car. W. to Miss. July. 21.

—Stem 2 feet high. Flowers yellow, in a long terminal spike or raceme.

Agrimony.

2. A. parviflora Ait.: somewhat hairy; leaves interruptedly pin. nate; leafets numerous, linear-lanceolate, incisely serrate; spike virgate; flowers on very short pedicels; petals once and a half the length of the calyx; fruit roundish, divaricately hispid.

Hab. Woods. Penn. to Virg. Pursh—Aug. 4.—Flowers small, yellow.—Perhaps a mere variety of the former.

12. ROSA. Linn.

Calyx urceolate, fleshy, contracted at the orifice, 5-cleft. Petals 5. Stamens numerous. Carpels numerous, bony, hispid, included in the fleshy tube of the calyx.

Icosandria. Polygynia.

- * Styles cohering in a column. Fruit ovate or subglobosc.
- 1. R. rubifolia Brown: stem ascending; branches glabrous; prickles few falcate; leaves ternate, ovate-lanceolate, serrate, pubescent beneath; stipules narrow, entire; peduncles and calyx hispid; flowers subsolitary; lobes of the calyx ovate, short, simple; styles cohering in a tomentose club-shaped column, as long as the stamens; fruit pisiform.
 - HAB. Shores of the Western lakes. W. to Miss. July. 5.—
 Flowers very numerous, changing white to different shades of red, sometimes in a corymb.
- ** Styles free mostly included. Fruit globose or globose-depressed. Stipular prickles usually in pairs.
- 2. R. lucida Ehrh.: prickles recurved or none; leafets 5-9, lanceolate-elliptic, coriaceous, obtusely serrate, shining; stipules dilated, large, smooth, serrulate; peduncles somewhat hispid; segments of the calyx entire, appendaged, spreading but not deflexed; flowers mostly in pairs; fruit globose-depressed, hispid or smooth.

HAB. Mountain swamps. N. Y. to Car. July. 5.—Shrub 3—4 feet high. Flowers large, red. Petals emarginate. Fruit red.

Swamp Rose.

3. R. nitida Willd.: arms crowded, slender subequal; leafets 5—9, rigid, lanceolate, shining; stipules large, finely serrulate; lobes of the calyx spreading; fruit subglobose, shining, red.

HAB. In Penn. Muhl. b.—A low shrub.—Perhaps a variety of the former.

4. R. parviflora Ehrh.: prickles straight, horizontal, needlc-shaped or none; leafets 5—9, lanceolate, smooth, coarsely serrate, flaccid; stipules large, subdenticulate; fruit depressed-globose and with the peduncle of the calyx very long, appendaged.—R. caroliniana Mich.

HAB. In woods. N. Y. to Car. W. to Lake Superior. June, July. 5.—Skrub 3 feet high. Flowers in pairs. Petals large, red, broadly obovate, emarginate.—There are a number of varieties of this species.

5. R. carolina Linn.: prickles recurved, often wanting; leafets 5-9, coriaceous, lanceolate or obovate, serrulate, approximate, glaucous beneath; stipules long, with an involute margin; flowers mostly in

corymbs, rarely solitary; lobes of the calyx very long, appendaged, spreading; fruit depressed-globose, hispid, rarely smooth.—R. corym-

bosa Ehrh.—R. pennsylvanica Mich.—R. florida Don.

HAB. Swamps. Can. to Car. W. to Miss. June, July. ?—Shrub 3-8 feet high. Flowers 5—7 in terminal corymbs. Petals large, red, obovate, emarginate. Petioles tomentose.—A very variable species, including the above and some others which have been described as distinct species. A variety? of this species occurs on an Island near Troy, N: Y. with the stems uniformly and constantly smooth, except very near the root, where there are sometimes a few slender prickles. This, and a slight difference in the shape of the fruit, which is depressed-globose, led me to believe it a distinct species.

*** Styles free. Fruit ovate, rarely globose. Prickles few, not stipular.

6. R. gemella Willd.: stipular prickles uncinate, in pairs; leafets 5—7, oblong, acute, opaque, pubescent beneath; flowers mostly in pairs; fruit depressed-globose, and with the peduncles glabrous.

Hab. Dry hills. N. Eng. to Car. Pursh. July. ?.—Shrub low, with large red flowers.—This species is considered by De Candolle a variety of the R. einnamomea, differing from it only in being more slender and nearly unarmed, and in having the stipules narrower. But this, as well as several other points connected with our roses, must remain doubtful until they have been more attentively studied.

7. R. stricta Muld.: very branching; branches with numerous slender prickles below, naked at the apex; leafets 7—9, ovate, obtuse, somewhat rigid; peduncles hispid; fruit small, elongated.

HAB. N. Eng. and Penn.—De Candolle, from whom the above description and locality are quoted, thinks it may be a variety of R. alpina.

8. R. rubiginosa Linn.: prickles strong, compressed, uncinate, rarely straight; leafets 5—7, ovate or somewhat rounded, serrate, more or less, especially beneath glandular and ferriginous; fruit elliptical, short, and with the peduncles hispid.—R. suareolens Pursh. Ell.

a. pubera De Cand.: flowers subsolitary; fruit ovate, smooth; peduncles glandular-hispid; leafets roundish, glandular beneath, and with the petioles somewhat pubescent.—R. micrantha

Smith. Big.

HAB. Hedges and hill sides. Can. to Car. July. 5.—Shrub tall and slender. Flowers solitary, or 2 or 3 together, pale red. Fruit orange red.—A very variable species. Var. a. is found near Boston.

Succet-briar.

ORDER XXXVIII. POMACEÆ. Lind.

Calyx 5-toothed, the odd segment superior. Petals 5, unguiculate. Stamens indefinite. Disk thin, lining the tube of the calyx, bearing the petals and stamens on its margin. Ova-

ries 1—5, adhering to the side of the calyx; ovules ascending, 2, collateral, rarely solitary; styles 1—5; stigmas simple. Fruit an apple, 1—5-celled, or spuriously 10-celled; endocarp cartilaginous or bony. Seeds solitary, ascending; albumen none; embryo erect, with flat, rarely convolute cotyledons, and a short conical radicle.

Trees or shrubs. Leaves alternate, stipulate, simple or compound. Flowers in terminal cymes, white or pink.

1. CRATÆGUS. Linn.

Calyx with the tube urceolate, and the limb 5-cleft. Petals spreading, orbicular. Stamens many. Ovary 2—5-celled. Styles glabrous. Pome fleshy ovate, closed by the teeth of the calyx or incrassated disk. Putamen bony.

Icosandria. Di-Pentagynia.

* Leaves dentate or subentire, not lobed.

1. C. crus-galli Ait.: thorny; leaves obovate-wedgeform, subsessile, shining, coriaceous; corymbs compound; lobes of the calyx lanceolate, subserrate; flowers digynous; fruit small, mostly 1-seeded.—C. lucida Wangh. amer.

HAB. Borders of woods. Can to Car. W. to Miss. May, June 5.—A shrub or small tree much branched and with long spines. Flowers white in a corymb. Style often solitary. Fruit red.—There are several varieties of this species.

2: C. punctata Jacq.: thorny or unarmed; leaves obovate-euncate, smooth, somewhat plaited, serrate, tapering at base into a petiole; calyx villous; lobes subulate, very entire; fruit subglobose, with the summit depressed.

Hab. Woods and swamps. Can. to Car. May. 5.—A small tree. Leaves sometimes hairy beneath. Corymbs many-flowered, pubescent. Fruit red and yellow.

Common Thorn-tree.

3. C. clliptica Ait.: thorny; leaves elliptical, unequally serrate, smooth; petioles and calyx glandular; fruit globose, 5-seeded.

Hab. Dry swamps. Can to Car. May. \$\(\frac{1}{2} \cdots - Calyx \) with the segments obtuse. Fruit small, red. Pursh.

4. C. parriflora Ait.: thorny; leaves obovate-wedgeform, subsessile, incisely serrate, pubescent; flowers subsolitary, pentagynous; lobes of the calyx laciniate, villous; fruit subturbinate, with 5 bony 1-seeded nuts.—C. tomentosa Linn.—Mespilus laciniata Walt.

Hab. Sandy woods. N. J. to Car. June. b.—Shrub 4 feet high, with the younger branches and leaves tomentose. Fruit large yellow.

** Leaves often ineised or lobed.

5. C. pyrifolia Ait.: thorny or unarmed; leaves ovate-elliptic, incisely serrate, somewhat plicate and hairy; calyx villous; segments linear-lanceolate, serrate; flowers trigynous.

Hab. Rocky woods. Penn. to Car. W. to Michigan. June. b.—Leaves large, acute or acuminate at each end. Corymbs

many-flowered. Peduncles and calyx tomentose.

6. C. glandulosa Willd.: thorny; leaves obovate-wedgeform, smooth and shining; petioles, stipules and calyx glandular; fruit oval, 5-seeded.

HAB. Can. and Alleghany mountains. May. 5.—Fruit middle sized, scarlet.

7. C. coccinea Linn.: thorny; leaves on long petioles, ovate, subcordate, incisely lobed and serrate, glabrous; petioles and calyx pubescent and glandular; flowers pentagynous; petals orbicular.

Hab. Woods. Can. to Car. May. 5.—A large shrub. Leaves on long petioles, often subcordate. Flowers in corymbs, white. Fruit large, red, eatable.

Thorn-bush.

8. C. cordata Ait.: thorny; leaves cordate-ovate, pinnatifid, lobed and angled, smooth; petioles and calyx without glands; flowers pentagynous; fruit small, globose, depressed.—C. populifolia Pursh.

Hab. Banks of streams. May, June. 5.—A large shrub. Leaves with 3, 5 or 7 lobes. Corymb compound. Fruit red.

9. C. oxycantha Linn.: leaves obovate-wedgeform, nearly entire, trifid or lacinate, glabrous or shining; flowers in corymbs, 1—3 gynous; calyx without glands, acute.

Hab. Road sides, &c. N. S. June. 5.—A shrub 8—10 feet high. Flowers white. Fruit red, small.—This thorn is preferred in England for hedging. Introduced. Hawthorn. Quickset.

2. AMELANCHIER. De Cand.

Calyx 5-cleft. Petals lanceolate. Stamens many, rather shorter than the calyx. Ovary with 10, or 5 bipartite, cells. Styles 5, somewhat united at base. Fruit, when mature, 3-5-celled.

1. A. botryapium De Cand.: unarmed; leaves cordate, oval, conspicuously acuminate, pubescent when young, smooth when mature; flowers in loose racemes, appearing before the leaves; calyx pubescent; petals linear-lanceolate.—Aronia botryapium Pers.—Pyrus botryapium Linn. Pursh.—Mespilus canadensis var. cordata Mich.

HAB. Rocky woods. Can. to Car. May. b .- A small tree.

Flowers large, white. Fruit dark purple.

Service-berry. Shad-bush.

2. A. ovalis De Cand.: leaves roundish-elliptical, acute, smooth when mature; flowers in compact racemes; petals obovate; germs

and segments of the calyx pubescent; fruit black.—Aronia ovalis Pers.
—Pyrus ovalis Linn. Pursh.—Mespilus canadensis var. obovalis Mich.

HAB. In swamps. Can. to Car. N. to lat. 62°. May. b.—A small shrub. Supposed by some botanists to be a mere variety of the former, but certainly distinct. The fruit is about the size of a pea and eatable.

3. A.? sanguinea De Cand.: leaves oval, obtuse at each end, mucronate, with very slender serratures, subcordate at base; racemes few-flowered; calyx smooth; petals linear-obtuse.—Pyrus sanguinea Pursh.—Aronia sanguinea Nutt.

HAB. Can. and Mass. W. to Columbia river. Pursh. May. 5.

—A small tree with blood red branches. Berries red, eatable.

Pursh.

3. PYRUS. Linn. De Cand.

Calyx with the tube urceolate, and the limb 5-lobed. Petals roundish. Styles often 5, rarely 2—3. Apple closed, 5-celled, with a cartilaginous putamen. Cells 2-seeded. Seeds with a cartilaginous covering. Icosandria. Di-Pentagynia.

- * Petals spreading, flat. Styles 5, nearly united at base. Leaves simple, without glands. Malus.
- 1. P. eoronaria Linn.: leaves broadly-oval, round at the base, somewhat angular, serrate, smooth; corymbs terminal, few-flowered, on long peduncles; flowers large; fruit depressed.—Malus coronaria Mich.
 - HAB. In woods. N. J. to Geor. May. 5.—A tree 15—20 feet high. Flowers large, fragrant, pale rose-colour.
- 2. P. angustifolia Ait.: leaves lanceolate-oblong, acute at base, slightly crenate-dentate, shining; peduncles corymbose.—Malus angustifolia Mich.
 - HAB. Penn. May. b. Muhl.—A tree 15—20 feet high. Leaves and fruit smaller than in the preceding.
 - ** Styles 2-5. Leaves pinnate. Sorbus.
- 3. P. americana De Cand.: leaves pinnate; leafets oblong-lanceolate, acuminate, somewhat equally serrate, and with the common petiole very smooth; flowers in terminal corymbs.—Sorbus americana Pursh.
 - Hab. Mountains. Can and N. S. May. 5.—A shrub or small tree with the younger branches pubescent. Flowers white. Stamens very numerous. Styles mostly 3. Fruit globose, fulvous, remaining on the tree all winter.

 Mountain Ash.
- 4. P. microcarpa De Cand.: leaves pinnate; leafets acuminate, acutely and incisely serrate, and with the common petiole smooth; serratures setaceously mucronate.—Sorbus microcarpa Pursh.
 - Hab. High mountains. N. J. to Car. Pursh. May. \(\frac{1}{2}\).—A large shrub, with the younger branches glossy. Flowers white. Fruit small, scarlet.

- *** Petals spreading, with claus. Styles 2-5. Leaves simple, glandular above near the rachis. Adenorated.
- 5. P. arbutifolia Linn.: leaves obovate-lanceolate, acute, crenately serrulate, tomentose beneath (especially the younger ones;) midrib glandular above; flowers in corymbs; calyx tomentose.—Aronia pyrifolia Pers.—A. arbutifolia Ell. Nutt. Torr.

HAB. Low woods. Can. to Car. May, June. b.—Shrub 2-5 feet high. Flowers reddish. Fruit about the size of a large wortle-berry, scarlet.

6. P. melanocarpa Willd.: leaves obovate-oblong, acuminate, serrate, smooth beneath, midrib glandular; flowers in terminal corymbs; calyx smooth.—Aronia arbutifolia Pers.—A. arbutifolia var. melanocarpa Torr.

Han. Bogs. Can. to Car. May, June. 5.—A shrub about the size of the preceding and perhaps not distinct.

ORDER XXXIX. SANGUISORBEÆ. Lind.

Flowers often declinous. Calyx 3—4—5-lobed, with a thickened, afterwards indurated tube; æstivation valvate. Petals none. Stamens definite, alternating with the lobes of the calyx, (though sometimes fewer than them by abortion,) rarely indefinite; anthers erect, 2-celled and bursting longitudinally, or 1-celled and bursting transversely. Ovary solitary, simple, with a style proceeding from the apex or the base; ovule solitary, attached to the ovary close to the base of the style; stigma simple or compound. Nut solitary. Seed solitary, suspended or ascending; embryo without albumen; radicle superior; cotyledons large, plano-convex.

Herbs or under shrubs. Leaves alternate, simple, lobed or compound, with stipules. Flowers small, often in heads.

1. ALCHEMILLA. Linn.

Calyx tubular; tube somewhat contracted at the top; limb 8-parted, the alternate lobes smaller. Petals none. Stamens 1—4. Carpels 1—2, with a filiform capitate style on the side, at length dry and 1-seeded. Tetrandria. Monogynia.

A. alpina Linn.: leaves digitate; leafets 5-7, lanceolate-cuneate, obtuse, serrate at the apex, white and silky beneath.

HAB. High mountains. N. Hamp. and Ver. June, July. 21.-

2. SANGUISORBA. Linn.

Flowers perfect. Calyx 4-cleft, with two scales at base externally. Petals none. Stamens 4. Carpels 2, included

within the calyx, crowned by a style with a fimbriate apex, converted into dry indehiscent 1-seeded acines.

Tetrandria. Monogunia.

1. S. canadensis Linn.: leaves pinnate; leafets ovate-oblong subcordate, coarsely serrate; spikes cylindrical, very long; stamens longer than the corol.

HAB. Wet meadows. Can. to Geor. Aug.-Oct. 21.-Stem 2-4 feet high. Flowers white, in crowded spikes which are from 2-5 inches long. Burnet Saxifrage.

2. S. media Linn. : leaves pinnate and with the bracts smooth; leafets ovate, subcordate, toothed; spikes ovate-cylindric; stamens scarcely longer than the corol.

HAB. Wet meadows, principally on the mountains. Can. to Car. July, Aug. 24.—The spikes shorter than in the former, and tinged with red. Pursh.

ORDER XL. CALYCANTHEÆ. De Cand. Linn.

Sepals and petals confounded, indefinite, imbricated, combined in a fleshy tube. Stamens indefinite, inserted into a fleshy rim at the mouth of the tube, the inner sterile. Anthers adnate, turned outwards. Ovaries several, simple, 1celled, with one terminal style adhering to the inside of the tube of the calyx. Nuts enclosed in the fleshy tube of the calyx, 1-seeded, indehiscent. Seed ascending; albumen none; cotyledons convolute.

Shrubs with square stems. Leaves opposite, simple. Flowers axillary, solitary.

1. CALYCANTHUS. Linn.

Lobes of the calyx in many rows, imbricate, lanceolate, somewhat coriaceous, coloured. Stamens 12, unequal, deciduous; outer ones fertile. Acines many.

Icosandria. Polygynia.

C. lavigatus Willd.: lobes of the calyx lanceolate; leaves oblong or oval, gradually acuminate, somewhat rugose, smooth and green on both sides; branches straight, erect.—C. ferax Mich.

Hab. Mountains. Penn. to Car. May—July. b.—Shrub 4—6 feet high. Leaves opposite, entire. Flowers large, solitary, terminal. Calyx brownish-purple. Carolina Allspice.

ORDER XLI. ONAGRARIÆ. De Cand. Lind.]

Calyx superior, tubular, with the limb usually 4-lobed; the lobes cohering in various degrees, with a valvate æstivation. Petals generally equal in number to the lobes of the calyx, into the throat of which they are inserted, regular, with a twisted æstivation. Stamens definite, inserted into the calyx; filaments distinct; pollen triangular, usually cohering by threads. Ovary of several cells, generally crowned by a disk; style filiform; stigma capitate or 4-lobed. Fruit a berry or capsule, many-seeded, 1—2—4-celled. Seeds numerous, without albumen; embryo straight; radicle long and taper; cotyledons very short.

Herbs or shrubs. Leaves simple, alternate or opposite. Flowers axillary or terminal, of various colours.

1. EPILOBIUM. Linn.

Cayx 4-sepalled; sepals united into a long 4-sided tube; limb caducous. Petals 4. Stamens 8; pollen not viscous. Capsule linear, obtusely 4-sided, 4-celled, 4-valved, many-seeded, united with the calyx. Seeds crowned with pappus.

Octandria. Monogynia.

1. E. spicatum Lam.: stem tall, terete, smooth, branched above; leaves scattered, linear-lanceolate, veined, smooth; flowers large, pedicelled, in a terminal spike; petals irregular; stamens unequal, declined.—E. angustifolium Linn.

HAB. Swamps and moist woods. Can. and N. S. W. to Miss.
 July. 21.—Stem 3-5 feet high. Flowers purple, in a terminal leafless spike or raceme. Willow Herb.

2. E. coloratum Muhl.: stem terete, pubescent; leaves mostly opposite, lanceolate, serrulate, petiolate, smooth, with coloured veins; upper ones alternate; flowers small, axillary, near the extremity of the branches.

Hab. Wet meadows. N. S. July, Aug. 21.—Stem 3—4 feet high. Flowers small.—A very variable plant.

3. E. squamatum Nutt.: pubescent; root squamous, bulbous; stem terete, branching above; stem leaves opposite; those of the branches linear and entire, revolute on the margin; flowers pedunculate; petals bifid; stamens unequal; stigma clavate, undivided.—E. rosmarinifolium Pursh. Torr.—E. lineare Muhl. Big.?

Hab. Moist woods, &c. N. S. Aug. 21.—Stem a foot high, slender. Flowers small, terminal, white.—E. rosmarinifolium was a name applied by Hænke to a different species, which is recognized by De Candolle.

4. E. palustre Linn.: stem terete, branched, somewhat hirsute; leaves sessle, lianceolate, somewhat toothed, opposite and alternate, smooth; stigma undivided; fruit pubescent.

- IIAB. Low grounds. Penn. N. to Arc. Amer. Aug., Sept. 24.
 —Stem 2—3 feet high. Flowers pale red.
- 5. E. leptophyllum Raf.: stem branching, somewhat seabrous; leaves alternate, subsessile, narrow-linear, entire, smooth, 1-nerved, acute, narrowed at base; flowers axillary, solitary, pedunculate.

HAB. Moist woods. Penn. and Mar. - Raf. in De Cand. Prod.

6. E. tetragonum Linn.: stem 4-sided, nearly smooth; leaves sessile, laneeolate-oblong, denticulate, lower ones opposite; stigma undivided.

Hab. Low grounds. Can. to Car. July. 21.—Stem 2 feethigh, branched, smooth. Flowers small, pale red, in terminal racemes.—Distinguished by its square stem.

7. E. strictum Muhl.: densely and softly pubescent; stem terete; leaves oblong-linear, sessile, very entire; the lower ones opposite; upper ones alternate; flowers pedicillate, subterminal, regular; petals 2-lobed; stigma entire.—E. molle Torr.

Has. Sand plains. N. Y. Aug. 21.—Stem 18 inches high, branched above and covered with a white pubescence. Leaves narrow, numerous. Flowers small, pale purple.—The name given to this species by Dr. Torrey is objectionable, having been previously appropriated to another species found on the continent of Europe. My specimens agree very well with Sprengel's description of E. strictum of Muhlenberg.

8. E. alpinum Linn.: stem simple, subterete, one or two flowered; leaves opposite, elliptical, entire; flowers sessile.

HAB. White mountains, N. H. N. to Arc. Amer.—Big. July. 21.—The smallest species,—not above two inches high. Flowers pale purple.

2. GAURA. Linn.

Calyx 3—4 sepalled; sepals united into a long obovate tube; limb caducous. Corol 3—4 petalled. Stamens 6—8. Ovary 3—4-sided, united to the base of the calyx. Seeds 1—4, not crowned with pappus. Octandria. Monogynia.

G. biennis Linn.: stem licrbaceous erect, liairy, mostly purplish; leaves alternate, sessile, lanceolate, toothed; flowers numerous, sessile, in terminal spikes; fruit roundish, slightly 4-angled, pubescent.

Hab. Banks of streams. N. Y. to Car. July, Aug. O.—Stem 2—3 feet high. Flowers dark rose-coloured, sessile, in terminal spikes.

3. ŒNOTHERA. Linn.

Calyx 4-sepalled; sepals united into a long 4-sided or 8-ribbed tube; limb and part of the tube caducous. Petals 4. Stamens 8, erect or declined; pollen triangular, viscous. Stigma 4-cleft, or spherical. Capsule oblong-linear, obtusely

4-sided or obovate-clavate, 4-celled, 4-valved, many-seeded, united with the base of the calyx. Octandria, Monogynia.

* Capsule clongated, 4-sided, sessile.

1. CE. biennis Linn.: stem villous and scabrous; leaves alternate, ovate-lanceolate, flat, toothed, very pubescent; lower ones on short petioles; upper sessile; flowers sessile, in a terminal spike; petals obcordate; stamens shorter than the corol.

HAB. Fields. Throughout the U. S. June-Sept. @ and &. -Stem 3-5 feet high. Flowers yellow, large, in a terminal leafy spike. Scabish-tree. Primrose.

2. Œ. muricata Linn.: stem purplish, muricate; leaves lanceolate,

flat; petals obcordate; stamens as long as the corol.

HAB. Old fields. N. Y. to Car. July, Aug. O. -Flowers yellow, smaller than in the preceding species.—According to De Candolle it resembles the next, but the margin of the capsule is not 8-cleft.

3. C. parviflora Linn.: stem smooth, subvillous; leaves ovatelanceolate, flat; stamens longer than the corol; capsule crowned with an 8-cleft margin.

HAB. Fields and woods. Can. to Virg. rare. o.-Pursh.

4. E. grandiflora Ait. : stem nearly smooth, branched; leaves ovatelanceolate, mostly smooth; flowers axillary, sessile, large; petals deeply obcordate; stamens declining, shorter than the corol.

HAB. Fields. Penn. to Car. July, Aug. 7.-Stem 2-3 feet high. Flowers axillary, very large, bright yellow. Introduced.

5. C. sinuata Linn. : stem diffuse, pubescent ; leaves oval-oblong, dentate-sinuate or incised; flowers solitary, axillary, sessile, villous; capsule prismatic.

b. minima Nutt.: stem low, simple 1-flowered; leaves entire .-Œ. minima Pursh.

HAB. Pine barrens. N. J. to Geor. W. to Miss. June. 21 .-Stem 1-6 inches high. Flowers small, terminal, yellow. Petals obcordate.

** Capsules obovate-clarate, angular, mostly pedicellate.

6. C. fruticosa Linn.: pubescent; stem branching from the base. divaricate; leaves sessile, lanceolate, slightly toothed, acute, pilose; flowers in a terminal raceme; petals broad-obcordate; capsule oblongclavate, pedicellate, angled.

HAB. Shady woods. N. Y. to Geor. July. 21.—Stem 12—18 inches high, purplish. Flowers pale yellow. Corol larger than the stamens. Sun-drop. Shrubby Enothera.

7. C. ambigua Spreng.: more or less pilose; stem simple; leaves lanceolate or ovate-lanceolate, acute, subdenticulate; petals obcordate, longer than broad; points of the calyx very short; capsule subsessile,

vays smooth, oblong and 4 winged; raceme naked below.— E. fruicosa var. ambigua Nutt.

HAB. Hills and dry woods. N. Y. Penn. Bart. July. 24.—
Stem a foot or more high, simple. Flowers pale yellow, smaller than in E. fruticosa.

8. (E. incana Nutt.: stem slender, erect; leaves flat, hoary and tomentose, very entire, elliptic-ovate, acute; raceme few-flowered, naked; capsule subsessile, oblong and square.

HAB. Dry woods. N. Y. and Mar. Stem 6-8 inches high. Flowers bright yellow.—Dr. Torrey supposes it to be a variety of *(E. fruticosa.*

9. C. hybrida Mich.: stem ercet, villous; leaves pubescent on both sides, lanceolate, remotely toothed, undulate; capsules somewhat spiked, on short foot-stalks, ovate, 4-angled.

Hab. Old Fields. Penn.—Darlington. S. to Geor. July—Sept. 21.—Stem 9—18 inches high. Flowers pale yellow.

Tube of the calyx 3 or 4 times as long as the segments.

10. *Œ. pumila Linn.*: stem weak, smooth or slightly hairy; leaves oblong-lanccolate, very entire, obtuse, flat; flowers small, in a terminal raceme; segments of the calyx longer than the tube; capsule subsessile, 8-angled.—*Œ. chrysantha Mich.*

Hab. Dry fields. N. S. to Car. July. 24.—Stem 8—12 inches high. Flowers small, bright yellow.

11. *Œ. pusilla Mich.:* subpubescent; stem nearly simple; leaves lanceolate-oblong, somewhat obtuse, entire; flowers axillary at the summit; capsule sessile, clavate-turbinate, almost equally 8-angled.

Hab. High mountains. Penn. to Virg.—Pursh. July, Aug. 21.—Stem 6—8 inches high, erect. Flowers small, yellow.

12. *Œ. chrysanthu Mich.*: stem slender, minutely pubescent: leaves lanceolate, rather obtuse, flat, entire; segments of the calyx as long again as the tube; capsule clavate-sessile, acute, angled.

HAB. Mountains. Can. and N. S. July. 21.—Stem a foot high. Flowers small, bright yellow.—I am induced to believe that this is not distinct from the former, but that E. chrysantha, E. pusilla and E. canadensis of Goldie, are all mere varieties of the same species, probably E. pumila of Linnœus.

4. ISNARDIA. Linn.

Tube of the calyx ovate or subcylindric, short, adhering to the ovary; limb 4-parted, persistent. Petals sometimes 4, alternating with the calyx; sometimes none. Stamens 4. Style filiform, deciduous. Stigma capitate. Capsule obovate or nearly cylindrical, 4-sided, 4-valved, many-seeded.

Tetrandria. Monogynia.

* Petals 4. LUDWIGIA.

1. I. alternifolia Dc Cand.: stem ereet, branched, nearly smooth; leaves alternate, lanceolate, somewhat scabrous on the margins and

under side; peduncles axillary, 1-flowered; capsules obovate-globose, 4-angled, winged; segments of the calyx large, ovate.—Ludwigia alternifolia Linn.—L. macrocarpa Mich.

HAB. Swamps. Can. to Flor. July. 21.-Stem 2 to 3 feet high.

Flowers yellow, on short peduncles.

2. I. uniflora Beck: stem straight, simple; leaves alternate, lanceolate, acute, smooth; flower terminal; petals longer than the calyx.—Ludwigia uniflora Raf. Torr.

Hab. N. Jersey.—This seems to be sufficiently distinct.—Dr. Torrey, however, suggests that it is a variety of the former.

.3 I. hirsuta R. & S.: stem erect, sparingly branched, hairy; leaves alternate, oblong, sessile, somewhat hirsute; peduncles 1-flowered, axillary; capsules globose, 4-angled, winged, hairy.—Ludwigia pilosa Walt.—L. hirsuta Lam.

Hab. Ditches and pools. July, Aug. 21.—Stem 2 feet high. Flowers yellow, axillary.

** Petals none. ISNARDIA.

4. I. palustris Linn.: stem prostrate, creeping, glabrous; leaves opposite, ovate-lanceolate, tapering at base, petioled, smooth; flowers axillary, solitary, sessile; capsule subovate, slightly angled.—Ludwigia nitida Mich. Pursh.—L. palustris Ell.—L. apetala Walt.

Hab. Stagnant waters. Throughout the U.S. June. 21.— Stem succulent. Flowers solitary, axillary, sessile. Corol none.

ORDER XLII. CIRCÆACEÆ. Lind.

Calyx superior, deciduous, tubular, with a two parted limb. Petals 2, alternate with the lobes of the calyx. Stamens 2, alternate with the petals, inserted into the calyx. Disk large, cup-shaped, filling up the whole of the tube of the calyx and projecting beyond it. Ovary 2-celled; style simple; stigma emarginate. Fruit 2-celled, 2-valved, 2-seeded. Seed solitary, erect; albumen none; embryo erect; radicle short.

Herbs with opposite toothed and petioled leaves. Flowers in terminal and lateral racemes, covered with uncinate hairs.

1. CIRCÆA. Linn.

Calyx short; limb bipartite. Petals 2, obcordate. Stamens 2, alternating with the petals. Stigma emarginate. Capsule ovate, hispid, with uncinate hairs, 2-celled, 2-valved, 2-seeded.

Diandria. Monogynia.

1. C. lutetiana var. canadensis Linn.: stem erect; leaves petioled, ovate, remotely toothed, opaque, nearly smooth.—C. canadensis Muhl.—C. lutetiana Big.

- Hab. Moist woods. Can. to Car. July, Aug. 24.—Stem a foot and a half high, smooth, simple. Flowers in long terminal racemes, reddish-white.

 Enchanter's Nightshade.
- 2. C. alpina Linn.: stem branched, very smooth, often procumbent; leaves broad-cordate, membranaceous, acutely toothed, shining.

HAB. Moist shady places on mountains. Can. to Car. July. 21.
—Stem 6—8 inches ligh, somewhat diaphanous. Leaves very thin and delicate. Raceme filiform.—Many botanists consider this a mere variety of the preceding.

ORDER XLIII. HALORAGEÆ. De Cand. Lind.

Calyx superior, with a minute limb. Petals minute, inserted into the summit of the calyx, or wanting. Stamens inserted into the same place, mostly equal in number to the petals. Ovary adhering inseparably to the calyx, with one or more cells; styles none; stigmas equal in number to the cells. Fruit dry, indehiscent, membranous or bony, with 1 or more cells. Seeds solitary; albumen fleshy; embryo straight, in the axis; radicle superior.

Herbs, growing in wet places, with alternate, opposite or whorled le aves. Flowers sessile, occasionally monoecious or dioecious.

1. PROSERPINACA. Linn.

Tube of the calyx adhering to the triquetrous ovary; limb 3-parted. Petals none. Stamens 3. Stigmas 3. sessile upon the top of the ovary. Carpels 3, indehiscent, dry, concreted into a 3-sided fruit. Triandria. Trigynia.

1. P. palustris Linn.: upper leaves linear-lanceolate, serrate; lower ones often pinnatifid; fruit angular, acute.—P. palustris var. a. Mich.

Hab. Wet places. Can. to Car. July, Aug. 21.—Stem procumbent. Leaves alternate, sessile. Flowers axillary, nearly sessile. Mermaid Weed.

2. P. pectinata Lam.: leaves all pinnatifid-pectinate; nut large, angular, obtuse.—P. palustris var. b. Mich.

HAB. Wet grounds. N. J. to Geor. Aug. 21.—Distinguished from the former, by having the leaves all finely pectinate and the fruit with rather obtuse angles.

2. MYRIOPHYLLUM. Linn.

Flowers monoecious or rarely perfect. Sterile Fl. Ca-lyx 4-parted. Petals 4-lobed, alternating with the calyx, ovate, caducous. Stamens 4—6—8. Perfect Fl. Calyx

adhering to the ovary; limb 4-lobed. Petals none. Nuts 4, compressed or subglobose, 1-seeded.

Monoecia. Polyandria.

* Flowers octandrous.

1. M. spicatum Linn.: leaves verticillate, pinnately divided; lobes capillary; spike terminal, nearly naked; floral leaves shorter than the flower; lower ones subserrate and mostly very entire.

HAB. In water. Can. and N. S. Aug., Sept. 21.-Stem slen-

der, branched. Leaves in whorls, by fours, pectinate.

Water Milfoil.

2. M. verticillatum Linn.: leaves verticillate, pinnately divided; lobes capillary, opposite; spike terminal, leafy; floral leaves all pinnately divided, much longer than the flowers, and scarcely distinct from the leaves.

Hab. In water. Can. to Car. July. 24.—Upper flowers cometimes perfect.

** Flowers hexandrous.

capillary lobes; spike terminal, nearly naked; floral leaves opposite, ovate, acute, coarsely serrate, longer than the flowers.—Potamogeton verticillatum Walt.

HAB. In water. N. S. to Geor. July. 21.—Stem simple. Flowers purple.

*** Flowers tetrandrous.

4. M. capillaceum Torr.: leaves all capillary-pinnate; flowers axillary, opposite and alternate, tetrandrous, mostly perfect; fruit quadrangular, formed of 4 cylindrical seeds.

HAB. Ponds. July, Aug. 21.—Floating-stem branched, dichotomous. Leaves hair-like.

5. M. ambiguum Nutt.: leaves petiolate, pinnate, the lowest ones capillary; emerging ones pectinate; uppermost nearly entire, subserrate; anthers partly oblong; fruit quadrangular.

 b. limosum Nutt.: stem rooting, erect; leaves rigid, partly entire, or divided above, mostly trifid; segments setaceous and acute.

-Purshia humilis Raf. ?

- Hab. Ponds. N. J. July. 21.—Floating in extensive masses. Stem dichotomous. Leaves attenuated so as to appear petioled, pectinately pinnatifid. Flowers axillary, solitary, sessile.—var. b. Miry shores of the Delaware, N. J. Stem erect, 2—4 inches high, decumbent and rooting. Leaves rigid and spreading, very narrow, setaceous and acute. Flowers as in the preceding, but the anthers are roundish.
- 6. M. tenellum Big.: stem simple, nearly leafless, erect, somewhat rooting at base; leaves in form of scales, alternate, entire; upper ones bearing flowers in the axils; spike terminal, interrupted; flowers alternate.

- HAB. Ponds. Mass. July. 21.—Stem 4—12 inches high. Flowers alternate, sessile. Petals white, 3 times as long as the calyx.
- 7. M. procumbens Big.: stem procumbent, round, rooting, branched; leaves pinnatifid with five or six narrow segments; flowers axillary, solitary, sessile.

HAB. Ponds. Danvers, Mass.-Resembles M. scabratum of Mi-

chaux.

3. CALLITRICHE. Linn.

Flowers perfect or imperfect. Bracts 2, opposite, petaloid. Calyx (corol of authors) inconspicuous. Petals none. Sterile Fl. Stamen 1, (rarely 2) with the filament filiform and exserted; anthers remiorm. Fertile Fl. Styles 2, filiform, glandular. Capsule compressed, 2-celled, 4-seeded.

Monandria. Digynia.

1. C. verna var. intermedia Willd.: upper leaves spatulate-obovate, lower ones linear, obtuse and emarginate; flowers polygamous; margins of the capsule obtuse.—C. heterophylla Pursh.—C. verna Mich.—C. aquatica Big.

HAB. In shallow streams. Throughout the U.S. May—Aug. O.—Stem floating, sometimes 2 or 3 feet long. Uppermost leaves crowded into a stellated tuft, and 3-nerved. Flowers soli-

tary, axillary, white.

- 2. C. autumnalis Linn.: leaves all linear, 1-nerved, truncate or emarginate; capsule with acute margins; flowers perfect.—C. linearis Pursh.

 Hab. Ponds, &c. N. S. May. ③.—Scarcely differing from the former, except in having the leaves more generally linear.
- 3. C. terrestris Raf.: procumbent, diffused; leaves oblong, uniform, rather obtuse; capsule grooved on the margin.—C. brevifolia Pursh.

HAB. Swamps, &c. N. Y. to Virg. June—Aug. O.—Stem creeping Leaves crowded, short obtuse. Flowers polygyamous.

4. HIPPURIS. Linn.

Tube of the calyx adnate to the ovary; limb minute, entire. Petals none. Stamen 1, inserted into the margin of the calyx. Style filiform, received into a groove of the anther. Nut 1-seeded, crowned with the margined limb of the calyx.

Monandria. Monogynia.

H. vulgaris Linn. : leaves whorled, linear, acute.

HAB. Ponds and lakes. N. Y. and Penn. Aug. 21.—Stem 12—18 inches high, simple, erect. Leaves linear, mostly in whorls of eight. Flowers at the base of the upper whorls, one to each leaf, sessile, minute.

Mare's Tail.

ORDER XLIV. PODOSTEMEÆ. Lind.

Flowers naked, monoclinous, bursting through an irregularly lacerated spathe. Stamens hypogynous, varying from 2 to an indefinite number, monadelphous, alternately sterile and shorter. Ovary, free, spuriously 2-celled; ovules numerous; styles two or none; stigmas 2 or 3. Fruit slightly pedicillate, capsular, opening by two valves, which fall off from the dissepiment which is parallel with them. Seeds numerous, minute, their structure unknown, or according to Von Martius, entirely simple.

Herbs with floating stems. Leaves capillary or linear, or irregularly lacerated, or minute and imbricated. Flowers minute.

1. PODOSTEMUM. Mich.

Monoecious. Calyx and corol none. Stamens 2, affixed to a common pedicel. Germ ovate. Stigma 1, sessile. Copsule 2-celled, 2-valved, many-seeded. Seeds minute.

Monoecia, Diandria,

P. ceratophyllum Mich.

HAB. Rocks in streams. Del. to Car. July. 21.—Stem filiform, floating. Leaves pinnate. Flowers axillary.

ORDER XLV. CERATOPHYLLEÆ. De Cand. Lind.

Flowers monoecious. Calyx inferior, many-parted. Stamens 12—20; filaments wanting; anthers 2-celled. Ovary superior, 1-celled; ovule solitary, pendulous; stigma filiform, oblique, sessile. Nut 1-celled, 1-seeded, indehiscent, terminated by the hardened stigma. Seed pendulous, solitary; albumen none; embryo with 4 cotyledons, alternately smaller; plumula many-leaved; radicle superior.

Floating herbs with multifid cellular leaves.

1. CERATOPHYLLUM. Linn.

Monoccious. Calyx many-parted. Sterile Fl. Corol none. Stamens 16—20; anthers tricuspidate. Fertile Fl. Corol none. Style 1, filiform. Nut 1-seeded.

Monoecia. Polyandria.

C. demersum Linn.: fruit armed with 3 spines.

HAB. Under water. N. Y. to Virg. July. 21.—Stem long, slender. Leaves verticillate, in eights. Flowers axillary, solitary, very minute.

Hormoort.

ORDER XLVI. SALICARIÆ. Lind.

Calyx with one sepal, the lobes with a valvate or separate estivation. Petals inserted between the lobes of the calyx, very deciduous, sometimes wanting. Stamens inserted into the tube of the calyx below the petals, to which they are sometimes equal in number; sometimes twice, thrice or four times the number; seldom four; anthers adnate, 2 celled; ovary superior, 2—4-celled; style filiform; stigma usually capitate. Capsule membranous, covered by the calyx, usually 1-celled. Seeds numerous, small, without albumen; embryo straight; radicle turned towards the hilum. Cotyledons flat and leafy.

Herbs rarely shrubs. Leaves opposite, seldom alternate, entire. Flowers axillary or in terminal spikes or racemes.

1. AMMANNIA. Linn.

Calyx campanulate, 8-toothed. Petals 4, or none. Stamers 4. Capsule 4-celled, many-seeded, 1-celled.

Tetrandria. Monogynia.

1. A. ramosior Linn.: stem erect, somewhat 4-sided; leaves linear-lanceolate, dilated at the base; flowers axillary, sessile; the lower ones compactly whorled; the upper ones solitary; petals 4, obovate-roundish; stamens 4.

HAB. Salt meadows. N. J. to Car. Aug., Sept. O.—Stem 4-8 inches high; sometimes much higher. Flowers purple, minute.

2. A. humilis Mich.: stem procumbent at the base, square, somewhat branched; leaves narrow-lanceolate, tapering at base; flowers sessile, solitary, axillary; petals 4, orbiculate; stamens 4.—A. ramosior Walt.

HAB. Damp grounds. N. Y. to Car. Aug. @.—Stem 4—8 inches high, much more slender than in the former. Flowers small, blue.

2. LYTHRUM. Linn.

Calyx cylindric, striate, 8—12 toothed. Petals 4—6, inserted into the calyx. Stamens as many or twice as many as the petals, sometimes fewer. Style filiform. Stigma capitate. Capsule oblong, 2-celled, many seeded.

Icosandria. Monogynia.

1. L. salicaria var. pubescens Pursh: pubescent; leaves opposite and ternate, sessile, lanceolate, cordate at the base; flowers with 12 stamens, terminal, verticillate-spiked; capsule oblong.

HAB. Wet meadows. Can. and N. S. July, Aug. 21.—Stem 2 feet high. Flowers purple, very showy.—Pursh. Purple Loosestrife.

2. L. hyssopifolia Linn.: stem sparingly branched, square; leaves alternate and opposite, linear-lanceolate, somewhat obtuse; flowers axillary, subsessile, shorter than the leaves; bracts acute, small; petals 4-6, oblong; stamens 5-8.

HAB. Low grounds. N. Y. Nutt. 21.—Stem 12—18 inches high. Flowers pale purple. I have a specimen from Connecticut which agrees exactly with Elliott's L. lanceolatum the L. virgatum of Walter, and I am inclined to believe that these two

plants have been confounded.

3. CUPHEA. Jacq.

Calyx tubular, ventricose, 6—12 toothed, unequal. Petals 6—7, unequal. Stamens 11—14, rarely 6—7, unequal. Style filiform. Stigma simple or sub-bifid. Capsule membranaceous, 1—2-celled, at length bursting longitudinally.

Icosandria. Monogynia.

C. viscosissima Jacq.: viscous; leaves opposite, petioled, ovate-oblong, a little rough; flowers lateral, solitary, on short peduncles; calyx 6-toothed; petals 6; stamens 12.

HAB. Mountains. N. Y. to Geor. W. to Ken. Sept. . Sem 12—18 inches high, erect, branching. Flowers purple.— Dr. Matthew Stevenson has found this plant on the wet grounds near Cambridge, N. Y.

4. DECODON. Gmel. De Cand.

Calyx hemispheric-campanulate, 10-toothed, 5 teeth longer and spreading. Petals 5, undulate. Stamens 10, 5 very long. Capsule covered with the calyx, 3-celled, 3-valved. Seeds minute, apterous. Icosandria. Monogynia.

D. verticillatum Ell .- Lythrum verticillatum Linn.

Hab. Swamps. Can. to Flor. Aug. 24.—Stem 2—3 feet high, erect, pubescent. Leaves opposite and alternate, sometimes by threes, lanceolate, petiolate. Flowers axillary, whorled. Petals undulate, purple. Fruit subglobose. Swamp Willow-herb.

ORDER XLVII. MELASTOMACEÆ. De Cand. Lind.

Calyx with 4 or 5 teeth or divisions, which are more or less deep, or are sometimes united and separate from the tube like a lid. Petals equal to the segments of the calyx, perigynous.

Stamens usually twice as many as the petals, sometimes equal to them in number; anthers long, 2-celled. Ovary more or less coherent with the calyx, with several cells, and indefinite ovules; style 1; stigma simple, either capitate or minute. Pericarp either dry or distinct from the calyx, or succulent and combined with it, with several cells. Seeds innumerable, minute, without albumen; embryo straight or curved, with equal or unequal cotyledons.

Herbs, trees or shrubs. Leaves opposite, undivided, usually entire, with several ribs.

1. RHEXIA. Brown.

Calyx with the tube ventricose-ovate at base, narrowed at the apex; the limb 4-cleft. Petals 4, obovate. Anthers 8, attached to the filaments behind, naked at base. Capsule free in the calyx, 4-celled. Receptacle lanceolate, pedicellate. Seeds cochleate. Octandria. Monogynia.

1. R. mariana Linn: very hairy; leaves lanceolate, acute at each end, 3-nerved, subpetiolate; calyx tubular, nearly smooth.

HAB. Bogs. N. J. to Car. July, Aug. 21.—Stem 1—2 feet high. Leaves sometimes ovate-lanceolate, serrate, ciliate. Petals obovate, hairy on the outer surface, purple.

2. R. ciliosa Mich.: stem nearly square, smooth; leaves subpetiolate, oval, serrulate, ciliate, 3-nerved, smooth beneath, slightly hispid above; flowers with an involucre.—R. petiolata Walt.

Hab. Del. to Car. July. 21.—Stem 12—18 inches high. Flowers in a loose dichotomous panicle, purple, with an involucre of leaves at the base of each.

3. R. virginica Linn.: stem with winged angles, somewhat hairy, square; leaves sessile, ovate-lanceolate, ciliate, serrate, 3—7 nerved, sprinkled with hairs on both sides; corymbs dichotomous.

Hab. Wet meadows. N. Y. to Car. July. 21.—Stem a foot high. Flowers large, purple. Deer Grass.

ORDER XLVIII. CUCURBITACEÆ. De Cand. Lind.

Flowers usually declinous, sometimes monoclinous. Calyx 5-toothed, sometimes obsolete. Corol 5-parted, scarcely distinguishable from the calyx, very cellular, with strongly marked reticulated veins, sometimes fringed. Stamens 5, either distinct, or cohering in 3 parcels; anthers 2-celled, very long and sinuous. Ovary inferior, 1-celled, with 3 parietal placentæ; style short; stigmas very thick, velvety or

fringed. Fruit fleshy, more or less succulent, (a pepo.) Seeds flat, ovate, enveloped in an arillus, which is either juicy or dry and membranous; embryo flat, with no albumen; cotyledons foliaceous, veined; radicle next the hilum.

Stem succulent, climbing by means of tendrils formed by

abortive leaves. Leaves palmated, or with palmate ribs.

1. SICYOS. Linn.

Flowers monoecious. Sterile Fl. Calyx 5-toothed; teeth subulate. Corol 5-parted. Filaments 3? (or rather 5, in 3 sets.) Fertile Fl. Style trifid. Stigma somewhat thick, trifid. Fruit 1-seeded, often spiny.

Monoecia. Monadelphia.

S. angulatus Linn.: leaves cordate, 5-angled, toothed, scabrous; lobes acuminate; tendrils umbellate; sterile flowers corynbosecapitate, with the common peduncle long; fertile ones sessile.

HAB. Banks of streams. Can. to Car. June. O.—A small procumbent vine. Flowers whitish with green. Fruit small, ovate, hispid.

Single-seeded Cucumber.

2. MOMORDICA. Linn.

Flowers monoecious. Sterile Fl. Calyx 5-cleft; tube very short. Corol 5-parted. Stamens in 3 sets; anthers connate. Fertile Fl. Style 3-cleft. Ovary 3-celled. Fruit often muricate, bursting elastically when mature.

Monoecia. Monodelphia.

M.? echinata Muhl.: leaves cordate, angularly 5-lobed; lobes acuminate, very entire, glabrous, tendrils many-cleft; fruit roundish, setaceous-echinate, 4-seeded.—Sicyos lobata Mich.

Hab. Banks of streams. Penn. W. to Michigan. Aug. &.

—Plant climbing. Fruit 1—2 inches long. Balsam Apple.

3. MELOTHRIA. Linn.

Monoecious. Sterile Fl. Calyx 3-5 toothed. Corol campanulate. Filaments 5, in three sets. Fertile Fl. Calyx and corol as in the sterile. Style 1. Stigmas 3, fimbriate. Fruit 3-celled, many-seeded.

Monoecia. Monadelphia.

M. pendula Linn.: leaves somewhat reniform, lobed and angled, slightly hispid; fruit oval, smooth, pendulous.

Hab. Banks of streams. Penn. to Car. June. . —A slender vine running over small shrubs and herbs. Stem hairy. Leaves on petioles. Tendrils 5—6 inches long. Flowers axillary, yellow, the sterile in small racemes, the fertile solitary.

Small Creeping Cucumber.

ORDER XLIX. PASSIFLOREÆ. De Cand. Lind.

Sepals 5, sometimes irregular, combined in a tube of variable length, the sides and throat of which are lined by filamentous or annular processes, apparently metamorphosed petals. Petals 5, arising from the throat of the calyx, on the outside of the filamentous processes, occasionally wanting, sometimes irregular, imbricated in æstivation. Stamens 5, monadelphous, rarely indefinite, surrounding the stalk of the ovarium; anthers turned outwards, linear, 2-celled, bursting longitudinally. Ovary seated on a long stalk, superior, 1-celled; styles 3, arising from the same point, clavate; stigmas dilated. Fruit surrounded by the calyx, stalked, 1-celled, with 3 parietal polyspermous placentæ, sometimes 3-valved. Seeds attached in several rows to the placenta, with a bristle sculptured testa surrounded by a pulpy arillus; embryo straight, in the midst of fleshy thin albumen; radicle turned towards the hilum; cotyledons flat, leafy.

Herbs or shrubs usually climbing. Leaves alternate, with

leafy stipules.

1. PASSIFLORA. Juss.

Calyx 5-parted, coloured, with the tube very short. Petals 5, or none, inserted into the calyx. Stamens 5, monadelphous. Crown of many filiform rays. Berry often pulpy, rarely submembranaceous, pedicelled. Monadelphia. Pentandria.

1. P. lutca Linn.: leaves cordate, 3-lobed, obtuse, nearly smooth; petioles without glands; peduncles axillary, in pairs; petals much longer than the calyx.

Hab. Banks of streams. Penn. to Flor. June—Aug. 24.— Stem climbing, slender. Flowers small, greenish-yellow.

Yellow Passion-flower.

2. P. incarnata Linn.: leaves smooth, subcuneate at base, 5-nerved, deeply 3-cleft; lobes oblong, acute; petioles with 2 glands; involucre 3-leaved; leafets lanceolate, glandular-serrate; ovary villose.

Hab. Banks of streams. Del. to Flor. Sept. 21.—Stem long, climbing. Petals white. Nectary purple, longer than the corol.

Fruit subacid and spongy, eatable.

ORDER L. PORTULACEÆ. De Cand. Lind.

Sepals 2, seldom 3 or 5, cohering by the base. Petals generally 5, occasionally 3, 4, or 6, either distinct, or cohering in a short tube, sometimes wanting. Stamens inserted along

with the petals irregularly into the base of the calyx, variable in number, all fertile, sometimes opposite the petals; filaments distinct; anthers versatile, with 2-cells, opening lengthwise. Ovary superior, 1-celled; style single, or none; stigmas several, much divided. Capsule 1-celled, dehiscing either transversely or by 3 valves, occasionally 1-seeded and indehiscent. Seeds numerous, if the fruit is dehiscent; attached to a central placenta; albumen farinaceous; embryo curved round the circumference of the albumen, with a long radicle.

Succulent shrubs or herbs. Leaves alternate, seldom opposite, entire, without stipules, or sometimes with membranaceous ones on each side at the base.

1. PORTULACCA. Linn.

Calyx inferior, 2-parted. Petals 4—6, equal, inserted into the calyx. Stamens 8—15. Style 1, 3—6-cleft at the apex, or style none, and stigmas 3—8-elongated. Capsule subgloblose, 1-celled, many-seeded, opening circularly.

Polyandria. Monogynia.

P. oleracca Linn.: leaves cuneiform, fleshy, smooth; axils geniculate, naked; flowers sessile.

HAB. Near gardens, &c. N. S. May—Aug. . —Stem spreading, succulent. Flowers yellow. Introduced. According to Mr. Nuttall it is indigenous on the plains of the Missouri.

Purslane.

2. TALINUM. Sims.

Calyx of 2 evate deciduous sepals. Petals 5, distinct, or somewhat concreted at base. Stamens 10—20. Style filiform, cleft at the apex. Capsule 1-celled, 3-valved, many-seeded.

Polyandria. Monogynia.

T. teretifolium Pursh.: leaves terete, subulate, fleshy; cyme terminal, dichotomous corymbose; flowers pedunculate, polyandrous.

HAB. Rocks. Penn. to Virg. July—Sept. 21.—Root of a firm and fleshy consistence. Stem 4-10 inches high. Leaves crowded, cylindrical, incurved, 1—2 inches long. Flowers reddishpurple.—A figure and detailed description of this handsome little plant are given by Dr. Darlington in his Florula Cestrica.

3. CLAYTONIA. Linn.

Calyx of 2 ovate or roundish persistent sepals. Petals 5, obcordate or obovate, unguiculate. Stamens 5, inserted into the claws of the petals. Ovary sessile. Style 3-cleft. Capsule 1-celled, 3-valved, 3—5-seeded.

Pentandria. Monogynia.

C. virginica Linn.: leaves about 2, opposite, linear-lanceolate, thick; flowers in a loose simple raceme; sepals somewhat acute.

b. latifolia Torr. leaves ovate-lanceolate; sepals obtuse. - C. spa.

thulæfolia Nutt. ?

Hab. Wet meadows. N. Y. to Car. W. to Miss. April, May. 21.—Stem 6—10 inches high, erect or procumbent. Flowers rose-red, in a raceme. Varies much in the form of the leaves. Var. b. often supersedes the common variety. Spring Beauty.

ORDER LI. ILLECEBREÆ. Lind.

Sepals 5, seldom 3 or 4, distinct or more or less cohering. Petals minute, inserted upon the calyx between the lobes, occasionlly warting. Stamens perigynous, exactly opposite the sepals, if equal to them in number, sometimes fewer by abortion; filaments distinct; anthers 2-celled. Ovary superior; styles 2 or 3, distinct or partially combined. Fruit small, dry, 1-celled, either indehiscent, or opening with 3-valves. Seeds either numerous, upon a free central placenta, or solitary and pendulous from a funiculus originating in the base of the cavity of the fruit; albumen farinaceous; embryo lying on one side of the albumen, more or less curved, with the radicle always pointing to the hilum; cotyledons small.

Herbs or half shrubby plants. Leaves opposite or alter-

nate, entire, with scarious stipules.

1. ANYCHIA. Mich.

Calyx 5-parted; sepals connivent, subsaccate, callous at the apex. Petals none. Stamens 3—5; filaments distinct. Style none. Stigmas 2, subsapitate. Capsules indehiscent, 1-seeded, surrounded by the calyx.

Pentandria. Monogynia.

- 1. A. dichotoma Mich.: stem erect or spreading, dichotomously branched, pubescent; leaves opposite, lanceolate, smooth, acute; flowers solitary, terminal and axillary, very minute, on very short pedicels, about as long as the stipules.—A. canadensis Ell.—Queria canadensis Linn.
 - HAB. Dry soils. N. Y. to Car. July, Aug. . . Stem 6-12 inches high, very pubescent. Flowers solitary, terminal, very minute.

 Forked Chickweed.
- 2. A. capillacea De Cand.: stem very smooth and slender; leaves ovate; stipules shorter than the flowers; flowers remote.—A. dichotoma b. Torr.—Queria capillacea Nutt.
 - HAB. Pine barrens. N. J. Aug. . Probably only a variety of the former.

ORDER LII. SCLERANTHEÆ. Lind.

Flowers monoclinous. Calyx 4 or 5-toothed, with an urceolate tube. Stamens 1—10, inserted into the orifice of the tube. Ovary simple, superior, 1-seeded. Styles 1 or 2, emarginate at the apex. Fruit a membranous utricle, enclosed within the hardened calyx. Seed pendulous from the apex of a funiculus, which arises from the bottom of the cell; embryo cylindrical, curved round farinaceous albumen.

Small herbs. Leaves opposite, without stipules.

1. SCLERANTHUS. Linn.

Calyx 5 cleft, persistent; tube urceolate. Petals none. Stamens 10, rarely 5 or 2. Styles 2. Capsule very smooth, without valves, covered by the indurated tube of the calyx.

Decandria. Digynia.

S. annuus Linn.: stems spreading, slightly pubescent; flowers decandrous; calyx of the fruit spreading, acute.

Hab. Sandy fields. N. S. July. ②.—Stems numerous, procumbent. Flowers very small, green, in axillary fascicles.

Knawel.

ORDER LIII. CRASSULACEÆ. De Cand. Lind.

Sepals 3—20, more or less united at the base. Petals inserted in the bottom of the calyx, distinct or cohering in a monopetalous corol. Stamens inserted with the petals, either equal to them in number and alternate with them, or twice as many; filaments distinct, subulate; anthers 2-celled, bursting lengthwise. Hypogynous scales several, 1 at the base of each ovary, sometimes obsolete. Ovaries as many as the petals, 1-celled, tapering into stigmas. Fruit consisting of several follicles, opening by the suture in their face. Seeds attached to the margins of the suture, variable in number; embryo straight in the axis of the albumen, with the radicle pointing to the hilum.

Succulent herbs or shrubs. Leaves entire or pinnatifid; stipules none. Flowers usually in cymes, sessile, often arranged unilaterally along the divisions of the cymes.

1. TILLÆA. Linn.

Calyx 3—4-parted. Petals 3—4, oblong, acuminate. Stamens 3—4. Scales none or minute. Carpels 3—4, somewhat contracted in the middle, 2-seeded.

Tetrandria. Tetragynia.

T. simplex Nutt.: stem erect and simple; leaves connate, oblong-linear and somewhat acute; flowers alternate, sessile; petals erect, twice as long as the calyx.

Hab. Muddy banks of streams. N. S. July, Aug. . ——Plant minute. — Mr. Nuttall has given a figure and detailed description of this plant in the Journal of the Philadelphia Acad. i. 114.

2. SEDUM. Linn.

Calyx 5-parted; sepals ovate, often turgid and leafy. Petals 5, often spreading. Stamens twice the number of the petals. Carpels 5, with a nectariferous scale at the base of each.

Decandria. Pentagynia.

1. S. ternatum Mich.: stem creeping, a little scabrous; leaves flat, rounded-spathulate, ternate; cymes mostly 3-spiked; terminal flowers decandrous; the rest octandrous.—S. portulaccoides Muhl.

HAB. Rocks. Penn. to Car. May. 21.—Stem 4—6 inches long. Lower leaves rounded, the upper lanceolate. Flowers white, sessile.

Stone Crop.

2. S. telephioides Mich.: leaves ovate, flat, acute at each end, toothed; corymb fasciculate, many-flowered.

Hab. Rocks. N. J. to Car. July. 21.—Stem branching. Leaves alternate, sometimes oval. Corymb terminal, many-parted. Flowers pale purple.

3. PENTHORUM. Linn.

Calyx 5-parted. Petals 5. Stamens 10. Carpels 5, concreted at base into a capsule. Capsule 5-beaked, 5-celled, 5-sided at the apex. Seeds many.

Decandria. Pentagynia.

P. sedoides Linn.: stem branched, angular above; leaves alternate, lanceolate, subsessile, unequally serrate; flowers in terminal one-sided spikes or racemes; seeds numerous, elliptical.

Hab. Overflowed grounds. Can. to Car. July, Aug. 24.— Stem 12—18 inches high. Flowers white or pale yellow.

Virginian Stone Crop.

ORDER LIV. FICOIDEÆ. De Cand. Lind.

Sepals definite, usually 5, but varying from 4 to 8, more or less combined at the base, equal or unequal. Petals indefi-

nite, coloured, opening beneath bright sunshine, sometimes wanting. Stamens arising from the calyx, definite or indefinite, distinct; anthers oblong, incumbent. Ovary inferior, or nearly superior, many-celled; stigmas numerous, distinct. Capsule either surrounded by the fleshy calyx, or naked, many-celled, often 5-celled, opening in a stellate manner at the apex. Seeds definite or indefinite; embryo lying on the outside of mealy albumen, curved or spiral.

Shrubs or herbs. Leaves succulent, opposite, simple.

1. SESUVIUM. Linn.

Calyx 5-parted, persistent, lobes coloured within. Petals none. Stamens 15—30, inserted at the top of the short calycine tube. Ovary free, sessile. Style none. Stigmas 3—5. Capsule 3, rarely 4—5-celled, opening circularly, many-seeded.

Icosandria. Di-Pentagynia.

S. portulacastrum Linn.: leaves linear or lanceolate-oblong, flat; flowers pedicelled or subsessile.

Hab. See coast. N. J. to Flor. June—Sept. 21.—Stem succulent. Leares opposite, entire. Flowers solitary, axillary, reddish.—" Varies with flowers upon long pedicels, S. pedunculatum Pers. and with the flowers subsessile, S. sessile Pers."—De Cand.

ORDER LV. CACTEÆ. De Cand. Lind.

Sepals numerous, usually indefinite and confounded with the petals, either crowning the ovary or covering its whole surface. Petals numerous, usually indefinite. Stamens indefinite, more or less cohering with the petals and sepals; filaments longer, filiform; anthers ovate. Ovary fleshy, 1-celled; style filiform; stigmas numerous, collected in a cluster. Fruit succulent, 1-celled, many-seeded, smooth or covered with scales, scars or tubercles. Seeds without albumen; embryo straight, curved or spiral; cotyledons flat, thick, foliaceous.

Succulent shrubs, very variable in form. Leaves mostly wanting; when present fleshy, smooth, and entire or spine-like.

1. OPUNTIA. Tourn.

Sepals numerous, leafy, adnate to the ovary; outer ones flat, short; inner ones petal-like, obovate, rosaceous; tube

above the ovary none. Stamens numerous, shorter than the petals. Style cylindric, contracted at base. Stigmas many, erect, thick. Berry ovate, umbilicate at the apex, tuberculate and often bearing spines. Icosandria. Monogynia.

O. rulgaris De Cand.: stems erect or procumbent, destitute of proper leaves, articulately proliferous; articulations compressed, ovate; spines setaceous; flowers large, sessile on the margin of the joints; fruit succulent, smooth.—Cactus opuntia Linn.

HAB. Dry rocks and sandy soils. N. Y. to Car. and W. to Miss. June, July. 21.—Flowers yellow, sessile. Fruit pulpy and eatable. Sceds numerous, immersed in the crimson pulp.

Prickly Pear.

ORDER LVI. GROSSULACEÆ. Lind.

Calyx 4—5-cleft, regular, coloured. Petals 4—5, minute, inserted in the throat of the calyx. Stamens 4—5, inserted alternately with the petals, very short. Ovary 1-celled; style 2—4-cleft. Berry crowned with the remains of the flower, 1-celled; the cell filled with pulp. Seeds numerous, suspended among the pulp by long filiform funiculi; embryo minute, with the radicle next the hilum; albumen corneous.

Shrubs either unarmed or spiny. Leaves alternate, lobed.

1. RIBES. Linn.

Calyx campanulate, 5-cleft. Petals 5. Stamens 5, rarely 6; filaments free. Style 1—4 cleft. Berry 1-celled, many-seeded.

Pentandria. Monogynia.

* Stem without thorns. RIBESIA.

1. R. albinervium Mich.: unarmed; leaves short, acutely lobed, smoothish; nerves white; racemes recurved; berries smooth.

Hab. Catskill mountains. N. Y. April, May. V.—Flowers small, greenish-yellow. Berrics red. Pursh.

2. R. trifidum Mich.: unarmed; leaves moderately lobed, smooth above, pubescent beneath; racemes loose, pubescent; flowers rather flat, with the segments of the calyx somewhat 3-cleft; petals spatulate, obtuse; berries hairy.

HAB. Mountains. Penn. April, May. Pursh. p.-Branches weak. Leaves with subacute lobes. Corol purple. Berries red.

3. R. rigens Mick.: unarmed; branches straight; leaves on long petioles, acutely lobed and dentate, reticulate-rugose, pubescent beneath; racemes loose, many-flowered, becoming stiffly erect; segments of the calyx obovate, obtuse; berries hispid.

HAB. Mountains. N. S. May, June. b.—Racemes few-flowered, erect. Calyx and corol purple. Berries red, hispid.

Mountain Currant.

4. R. prostratum L'Herit.: unarmed; branches smooth, reclined-prostrate; leaves lobed, nearly smooth, with the margin ciliate; racemes somewhat erect, loose; calyx rather flat; petals deltoid; bracts minute; berries hispid.—R. glandulosum Ait.

Hab. Mountains, N. H. and Penn. May. 5.—Shrub 2—3 feet high. Flowers reddish-yellow, in a loose raceme. Berries red.

5. R. floridum Willd.: unarmed; branches smooth, recurved; leaves on long petioles, punctate both sides, acutely 3-lobed, pubescent; raceines pendulous, many-flowered, white pubescent; calyx tubular; bracts longer than the pedicels; berries ovate-globose.—R. recurvatum Mich.—R. pennsylvanicum Lam.

Hab. Woods and hedges. Can. to Virg. N. to Subarc. Amer. April, May. 5.—Shrub 3—4 feet high. Flowers pale yellow, 12—15 in a pendulous raceme. Berries black and insipid.

Wild Black Current.

** Stem thorny. GROSSULARIA.

6. R. hirtellum Mich.: spines subaxillary; branches somewhat hispid; leaves small, half 3-cleft; lobes subdentate; peduncles 1-flowered; berries smooth.

HAB. Rocks on the Alleganies, Can. to Vir. May, June. b.Berries red. Pursh.

7. R. gracile Mich.: spines subaxillary; leaves on slender petioles, pubescent on both sides; lobes acute, dentate, incised; peduncles slender, erect, about 2-flowered; calyx tubular, campanulate; berries often spiny.

11AB. Mountains. N. Y. to Car. April—June. 5.—Shrub 2—3 feet high. Petals white. Berries green becoming purple.

8. R. triflorum Willd.: spines subaxillary, short, leaves smooth, 3-5-lobed, incisely toothed, on short petioles; peduncles about 3-flowered; pedicels elongated; bracts very short; petals spatulate, undulate; styles hairy, exserted, deeply 3-cleft; berries small, smooth.

Hab. Mountains. N. S. May, June. 5.—Shrub 3—4 feet high. Petals white. Berries smooth, pale red, somewhat resembling the common gooseberry. Wild Gooseberry.

- 9. R. oxyganthoides Linu.: larger spines subaxillary; smaller ones scattered over the stem; leaves smooth, somewhat 3-lobed; lobes dentate; peduncles short, about 2-flowered; berries globose, smooth.

HAB. Rocks. April, May. 5.—Shrub 3 feet high. Flowers pale yellow. Berries purplish-blue.

10. R. lacustre Pursh: spines subaxillary, compound; stem on every part aculeate-hispid; leaves lobed beyond the middle; petioles villous; racemes pendulous, loose, 5—6-flowered; berries hispid.—R. oxycanthoides var. lacustris Pers.—R. oxycanthoides Mich.

HAB. Mountains. N. H. April—June. 5.—Shrub 3—4 feet high. Flowers small, greenish-yellow. Berries dark brown, hispid.

11. R. cynosbati Jacq.: subaxillary spines in pairs; leaves with short lobes, incisely toothed, softly pubescent; racemes nodding, few-flowered; calyx erect-campanulate; berries prickly.

HAB. Mountains. N. H. and Penn. April, June. b.—Racemes few-flowered. Calyx white. Petals very small. Berry cover-

ed with long prickles.

Prickly Gooseberry.

ORDER LVII. SAXIFRAGEÆ. De Cand. Lind.

Calyx either superior or inferior, 4—5-cleft. Petals 5, or none, inserted between the lobes of the calyx. Stamens 5—10, inserted either into the calyx, or beneath the ovary. Disk either hypogynous or perigynous. Ovary inferior, or nearly superior, usually consisting of two carpels, 1 or 2-celled, rarely 4 or 5-celled. Styles none. Stigmas sessile on the tips of the lobes of the ovary. Fruit a capsule or berry, with numerous minute seeds. Embryo taper in the axis of a fleshy albumen.

Herbs. Leaves simple, alternate, without stipules.

1. HYDRANGEA. Linn.

Calyx hemispheric, adnate to the germ, 5-toothed. Petals 5, regular. Stamens 10. Styles 2, distinct. Capsule 2-celled, crowned by the styles and teeth of the calyx, opening by a foramen between the styles. (Placed under Caprifoliaceæ by Lindley.)

Decandria. Digynia.

1. *H. vulgaris Mich.*: leaves oblong-ovate, acuminate, dentate, obtuse at base, smooth beneath; flowers in terminal naked cymes.—*H. arborescens Linn.*

Hab. Rocky situations. Penn. Pursh. July. 5.—Shrub 4—6 feet high. Flowers white.

2. H. radiata Walt.: leaves cordate, ovate, acuminate, serrate, tomentose and white beneath; cymes terminal, radiate.—H. nivea Mich.

Hab. Penn. to Geor. Muhl. July. 7.—Shrub 6 feet high.

Flowers white, very ornamental.

Hydrangea.

2. SAXIFRAGA. Linn.

Calyx 5-parted. Petals 5, entire, with short claws. Stamens 10. Capsule with 2-beaks, 2 celled, many-seeded, opening between the beaks.

Decandria. Digynia.

1. S. virginiensis Mich.: pubescent; stem nearly leafless, corymbose-paniculate; leaves oval, obtuse, crenate, narrowed at the base into a petiole; flowers subsessile; petals oval, much larger than the calyx; capsule half inferior.—S. vernalis Big.—S. nivalis Muhl.

Hab. Rocky hills. Can. to Geor. W. to Miss. April, May. 4.—Stem 4—12 inches high. Radicle leaves rather spathulate. Flowers crowded near the extremities of the branches, white.

Early Saxifrage.

2. S. pennsylvanica Linn.: pubescent; stem naked; leaves oblong-lanceolate, acute at each extremity, obsoletely denticulate; panicle oblong; flowers fasciculate; petals linear, longer than the calyx; capsule superior.

Hab. Wet grounds. N. S. May, June. 21.—Stem 1—2 sometimes 3—4 feet high. Petals yellowish-green. Much larger than the preceding. Root very astringent. Large Saxifrage.

3. CHRYSOSPLENIUM. Linn.

Calyx 4—5-cleft, coloured. Corol none. Stamens 8—10. Styles 2. Capsule with two beaks, 2-valved, at length 1-celled, many-seeded. Decandria. Digynia.

C. oppositifolium Linn.: leaves opposite, roundish, narrowed into a petiole, slightly crenate.

Hab. Springs and brooks. Can. to Car. April, May. 24.—

Plant succulent, creeping, with small sessile flowers. Stamens
usually 8. Golden Saxifrage.

4. MITELLA. Linn.

Calyx campanulate, 5-cleft. Petals 5, inserted into the calyx, laciniate or toothed. Stamens 10. Styles 2, united. Stigmas scarcely distinct. Capsule 1-celled, 2 valved; valves equal.

Decandria. Digynia.

1. M. diphylla Linn.: radicle leaves cordate-lobed, toothed and ciliate; cauline ones 2, opposite, smaller; flowers in a terminal raceme; petals toothed-pinnatifid; calyx and capsule at length membranaceous.

Hab. On wet rocks, &c. N. S. May. 21.—Stem 8—10 inches high. Flowers small, white, in a long terminal spike.

False Sanicle.

2. M. cordifolia Linn.: radicle leaves cordate, sub-3-lobed, doubly crenate; scape naked or with a single leaf, scaly at base; petals fimbriate-pinnatifid.—M. nuda Willd.—M. reniformis Lam. Pursh.

HAB. Moist rocks. Can. and N. S. June. 24.—Stem 6—8 inches high, sometimes prostrate with creeping suckers.

5. TIARELLA. Linn.

Calyx 5-parted, persistent, with the lobes obtuse. Petals 5, inserted into the calyx, unguiculate, entire. Stamens 10. Styles 2, distinct. Capsule 1-celled, 2-valved; valves unequal.

Decandria. Digynia.

T. cordifolia Linn.: leaves cordate, acutely lobed, dentate; teeth mucronate; scape racemed; petals with long claws.

HAB. Shady rocks. Can. and N. S. May. 21.—Scape 8—10 inches high. Flowers white, in a simple terminal raceme.

Mitre-wort.

6. HEUCHERA. Linn.

Calyx persistent, 5-cleft. Petals 5, inserted on the calyx. Stamens 5. Styles 2, distinct, as long as the stamens. Capsules with 2-beaks, 1-celled, many-seeded.

Pentandria. Digynia.

- 1. H. americana Linn.: vicidly pubescent; scape and leaves somewhat scabrous; leaves radical, on long pubescent petioles, with rounded and dentate lobes; flowers in a long terminal panicle or thyrse; calyx short, obtuse; petals lanceolate, as long as the calyx; stamens exserted.—H. cortusa Mich.—H. viscida Pursh.
 - Hab. Shady rocks. N. Y. to Geor. W. to Miss. Junc, July. 24.—
 Scape 2—3 feet high. Flowers small, red, in a long simple panicle.—This species has been found by Dr. Samuel B. Mead near
 North Salem, Westchester county, N. Y.

 Alum-root.
- 2. II. pubescens Pursh: pulverulent-pubescent; scape smooth below; leaves somewhat acutely lobed, smooth beneath, toothed; teeth rounded, mucronate; peduncles short, with crowded flowers; calyx large, bell-shaped; petals longer than the calyx; stamens scarcely exserted.

HAB. Mountains. Penn. and Virg. May, June. 21.—Scape 2 feet high. Flowers large, red with yellow.

7.? ITEA. Linn.

Calyx 5-cleft, campanulate. Petals 5, linear reflexed, inserted into the calyx. Stamens 5. Style 1. Stigma capitate, 2-lobed. Capsule 2-celled, 2-valved; valves bent inwards. (Placed by Dr. Torrey, with a mark of doubt, under this order; by other botanists under Ericea. Its true place does not appear to be fully settled.) Pentandria. Monogynia.

I. virginica Linn.

Hab. Borders of swamps. N. J. to Car. June. P.—Shrub
4—8 feet high, branching. Leaves alternate, lanceolate, acuminate, serrulate, pubescent beneath. Flowers white, in simple terminal racemes.

ORDER LVIII. UMBELLIFERÆ. De Cand. Lind.

Calyx superior, either entire or 5-toothed. Petals 5, inserted on the outside of a fleshy disk. Stamens 5, alternate

with the petals. Styles 2, distinct; stigmas simple. Fruit consisting of two carpels, which are attached to a common axis by their face (the commissure) from which they separate when ripe; each carpel traversed by ribs or ridges, of which 5 are primary, and 4 alternating with them, secondary. Seed solitary, pendulous; embryo minute, at the base of a horny albumen.

Herbs with fistular furrowed stems. Leaves mostly compound and sheathing at the base. Flowers in umbels.

SUBORDER 1. ORTHOSPERMÆ.

Albumen flat or flattish within.

* Umbels simple or imperfect.

1. HYDROCOTYLE. Linn.

Calyx with the tube subcompressed, and the margin of the limb obsolete. Petals ovate, entire, acute, with apex straight. Fruit laterally compressed; ribs 5, filiform, the middle and lateral ones often obsolete.—Umbel simple. Involucre fewleaved.

Pentandria. Digynia.

1. H. interrupta Muhl.: stem filiform, creeping, rooting at the joints, smooth; leaves peltate, orbicular, doubly crenate; flowers 5—8 in axillary umbellate heads.—H. vulgaris Mich.

HAB. Wet places. Can. to Geor. Pursh. June—Aug. 21.—
Flowers minute, white, in small umbels or bunches, which are
much shorter than the petioles.

Marsh Penny-wort.

2. H. umbellata Linn.: stem glabrous, rooting at the joints; leaves peltate-orbicular, doubly crenate; cmarginate at the base; umbels 20—30-flowered; flowers distinct, pedicelled.

Hab. Swamps. N. Y. to Geor. June—Aug. 21.—Umbels on peduncles longer than the leaves. Flowers white, minute.

3. H. americana Linn.: root tuberous; stem filiform, with long creeping suckers; leaves reniform, slightly 7-lobed, crenate; umbels few-flowered, axillary, nearly sessile.

Hab. Moist places. Can. to Geor. June, July. 2f.—Leaves nearly orbicular, 9-nerved. Umbels 4—6 flowered, axillary. Petals greenish-white.

4. H. cymbalarifolia Muhl.: creeping, glabrous; leaves reniform, 3-lobed, the intermediate one smaller, cordate, crenate; umbels few-flowered, on peduncles; flowers nearly sessile.—H. ranunculoides Linu.? Torr.

HAB. Penn. to Geor. June. 21.—Differs from the former in having the leaves smaller, more coriaceous in their texture, more

distinctly lobed, and in having the umbel pedunculate.—Sprengel considers this species identical with H. nitidula Mich.

2. CRANTZIA. Nutt.

Calyx with the tube subglobose; limb nearly wanting. Petals roundish, entire, obtuse. Styles obtuse. Fruit roundish; commissure excavated. Carpels (Mericarpia D. C.) unequal, with 3 marginated dorsal ribs, and 4 obtuse-angled grooves.—Umbel simple. Involucre \$5-6-leaved. Flowers white.

Pentandria. Digynia.

C. lineata Nutt.-Hydrocotyle lineata Mich. Torr.

Hab. Muddy banks of streams. N. Y. to Geor. July. 24.—
Stem smooth, creeping. Leaves about 2 at each joint, I 1-2 inch long, thick, sessile, linear, cuneate, with transverse lines. Umbels 8—10 flowered, on long peduncles. Flowers pedicellate, white.

3. ERIGENIA. Nutt.

Calyx with the margin obsolete. Petals 5, obovate, entire, equal. Styles persistent, very long, subulate. Fruit oval, somewhat laterally compressed. Carpels gibbously convex, marked with 3 striæ.—Umbel irregular, imperfect. General involucre none; partial one a few unequal leafets. Petals white.

Pentandria. Digynia.

E. bulbosa Nutt.—Hydrocotyle composita Pursh.—H. bipinnata Muhl.
—Sison bulbosum Mich.

Hab. Wet grounds. Lancaster, Penn. and W. to Miss. March, April. 21.—Root globose, tuberous. Stem simple, 4—5 inches high, 2-leaved. Leaves 3-parted; partitions subpinnate; segments rhomboidal, cleft. Umbels terminal, 3—5 flowered. Flowers white.—The habit of this plant is so decidedly different from Hydrocotyle as to warrant its separation.

4. SANICULA. Linn.

Calyx with the tube echinate and the lobes persistent. Petals erect connivent, obovate, deeply emarginate. Fruit subglobose, solid, not ribbed, armed with uncinate bristles.—Umbels few-rayed. Leafets of the involuere few, often divided. Flowers polygamous. Pentandria. Digynia.

S. marilandica Linn.: leaves digitate; leafets oblong, incisely serrate; flowers in small head-form umbels; fortile ones sessile, sterile ones pedicellate.

b. canadensis Torr.: leaves subternate; leafets ovate, coarsely toothed.—S. canadensis Linn.

Hab. Woods. Throughout the U.S. June, Aug. 24.—Stem 2 feet high, erect, smooth. Flowers greenish-white.—Var. b. is found, according to Mr. Brace, at Litchfield, Conn.

5. ERYNGIUM. Linn.

Calyx 5-parted; tube rough with scales. Petals erect, connivent, oblong-obovate, deeply emarginate. Fruit scaly or tuberculose.—Flowers in a roundish or oblong head. Lower bracts often large and resembling an involucre; the rest (chaff,) mixed with the flowers. Pentandria. Digynia.

1. E. aquaticum Linn.: leaves linear-lanceolate, nerved, remotely ciliate-spinose; lower ones subensiform; those of the flowers lanceolate, dentate; flowers in ovate heads, at the extremities of the branches; leafets of the involucre 8—9, shorter than the head and with the chaff entire.—E. yuccafolium Mich.

Hab. Wet grounds. N. J.? to Geor. Aug. 21.—Stem 2—3 feet high, smooth, dichotomous above. Flowers white or pale blue. Leaves 12—18 inches long. Medicinal. See Ell. Sk. i. 343.

Button Snake-room

2. E. virginianum Lam.: leaves long-lanceolate, serrate, tapering at each end; flowers in large terminal umbels or corymbs; leafets of the involucre 7—8, longer than the heads, laciniate, subulate, whitish beneath; chaff 3-cleft.—E. aquaticum Mich.

HAB. Marshes. N. J. to Geor. July, Aug. 21.—Stem 3-4 feet high, hollow. Leaves 6-8 inches long. Flowers pale blue or white.

3. E. virgatum Lam.: leaves spatulate-ovate, irregularly toothed, short petioled, sometimes a little cordate; heads of flowers small, pedunculate, shorter than the linear leafets of the involucre; chaff 3-cleft.—E. ovalifolium Mich. Ell.

HAB. Wet meadows. N. J. to Geor. July. 21.—Stem 2—3 feet high, simple, branching above. Leaves about 2 inches long. Flowers blue, in small heads.

** Umbels compound or perfect.

6. CICUTA. Linn.

Calyx with the margin 5-toothed. Petals obcordate, reflexed. Fruit roundish, didymous, laterally contracted. Carpels with 5 equal flattish ribs; the lateral ribs margined.—General involucre none or few-leaved; partial one many leaved. Flowers white.

Pentandria. Digynia.

1. C. maculata Linn.: stem spotted; lower leaves triternate and quinate; upper biternate; segments lanceolate or ovate-lanceolate, acuminate, mucronately serrate; umbels large, axillary and terminal; partial involucre of 5—6 setaceous leaves.

HAB. Wet grounds. Can. to Car. W. to Miss. July, Aug. 21.—Stem 3.—4 feet high, terete, smooth. Petals white, obcordate. Poisonous and medicinal. Big. Med. Bot. i. 125.

Water Hemlock.

2. C. bulbifera Linn.: leaves various, ternate and biternate; leafets linear and linear-lanceolate, remotely toothed; umbels small, terminal, solitary; partial involucre of 3—5 subulate leaves; axils of the leaves bulbiferous.

HAB. Swamps. Can. and N. S. Aug. 2.—Stem 2—3 feet high, smooth and slender. Umbcls small. Flowers white.

7. ZIZIA. Koch. Dc Cand.

Calyx with the margin obsolete or very short, 5-toothed. Petals elliptic, attenuated into a long inflexed point. Fruit laterally contracted, subdidymous, roundish or oval. Carpels with 5 prominent equal ribs; the lateral ribs margined.—General involucre none; partial one few-leaved. Flowers yellow, rarely white or dark purple. Pentandria. Digynia.

1. Z. aurea Koch: leaves biternate, shining; segments oblong-lanceolate, attenuate at base, incisely serrate; partial involucre 3-leaved, unilateral.—Smyrnium aureum Linn.—Sison aureus Spreng. Torr.—Thaspium aureum Nutt.

Hab. Rocky hills. N. Y. to Car. W. to Miss. June, July. 21.—Stem 11-2 to 2 feet high. Rays of the umbel short. Flow-

ers bright yellow.

2. Z. cordata Koch: radical leaves undivided, cordate, crenate, petiolate; cauline ones subsessile, ternate; segments petiolate, ovate, cordate, serrate; partial involucre 1-leaved.—Smyrnium cordatum Walt.—S. trifoliatum Nutt.

HAB. Meadows. Can. to Flor. W. to Miss. May, June. 24.—
Stem 12—18 inches high, smooth. Flowers yellow. Fruit black.

3. Z. integerrima Dc Cand.: leaves biternate, somewhat glaucous; segments ovate, very entire; partial involucre 1-leaved, very short.—Smyrnium integerrimum Linn.—Sison integerrimus Spreng. Torr.

HAB. Mountains. Can. to Geor. W. to Miss. June. 21.—
Stem 1—2 feet high. Umbel with elongated filiform rays. Flow-

crs yellow.

8. DISCOPLEURA. De Cand.

Calyx with 5 subulate persistent teeth. Petals ovate, entire. Fruit ovate, subdidymous. Carpels with 5 ribs; 3 dorsal ribs filiform, exsert, subacute; 2 lateral ones with a thick margin—Leaves much divided; the segments linear. Partial involucre a few linear setaceous leafets. Flowers white.

Pentandria. Digynia.

D. capillacea De Cand.: stem erect or procumbent; umbels 3—10-rayed; leafets of the involucre 3—5, mostly 3-cleft.—Ammi majus Walt.—Ammi capillaceum Spreng.

Hab. Bogs. N. Y. to Geor. July—Sept. ©.—Stcm 1—2 feet long, geniculate, smooth. Leaves many-parted, with the segments all linear. Flowers white, on axillary umbels.

Bishop Weed.

9. CRYPTOTÆNIA. De Cand.

Calyx with the margin obsolete. Petals obovate, subentire, inflexed. Fruit laterally contracted, linear-oblong, crowned with straight styles. Carpels with 5 equal filiform obtuse ribs.—Umbels numerous, arranged somewhat in the form of a panicle. Rays few. General involucre none; partial one few leaved. Flowers white. Pentandria. Digynia.

C. canadensis Dc Cand.: leaves ternate, smooth; leafets rhomboid-ovate, acute, incisely toothed, acutely serrate; umbels numerous, lower ones rising from the axils of the upper leaves; fruit oblong, rostrate with the persistent styles.—Sison canadense Linn.—Charophyllum canadense Pers. Pursh.—Myrrhis canadensis Nutt. Torr.

Hab. Rocky woods. Can. to Car. June. 21.—Stem 2—3 feet high, erect, smooth. Flowers white.

10. SIUM. Linn.

Calyx with the margin 5-toothed, often obsolete. Petals obovate, emarginate, inflexed. Styles divergent-reflexed, capitulate at the apex. Fruit compressed or contracted at the side, subdidymous, crowned with the styles. Carpels with equal filiform and somewhat obtuse ribs.—Mostly aquatics. Leaves pinnate. Umbels terminal. Involucre many-leaved, rarely wanting. Flowers white. Pentandria. Digynia.

1. S. latifolium Linn.: root creeping; stem erect, angular; leaves pinnate; leafets ovate-lanceolate, unequal at base, sessile, smooth, equally serrate, sometimes pinnatifid; umbels terminal, large, manyrayed; involucres many-leaved.

Hab. Swamps. Can. to Car. July. 21.—Stem 2-4 feet high.

Flowers white.—When growing in water the lower leaves are bipinnatifid, or have the leafets laciniate.

Water Parsnip.

2. S. lineare Mich.: stem erect, smooth, angular and sulcate; lower leaves pinnate, upper ones ternate; leafets linear-lanceolate, acutely and finely serrate; umbel terminal, with short rays; involucres many-leaved, linear.—S. tenuifolium Muhl.

HAB. Swamps. N. S. July. 21.—Stem tall. Leafets very long and narrow. Flowers white.

11. BUPLEURUM. Linn.

Calyx with the margin obsolete. Petals roundish, entire, involute. Fruit laterally compressed or subdidymous, crowned with the depressed style. Carpels with 5 winged acute, filiform or obsolete ribs; lateral ribs marginal.—Leaves mostly simple. Umbel compound. Involucre various. Flowers yellow.

Pentandria. Digynia.

B. rotundifolium Linn.: stem leaves perfoliate, roundish-ovate: umbel 5-rayed; general involucre none; partial one of 5-mucronate leafets.—B. perfoliatum Lam.

HAB. Near cultivated grounds. . . Introduced, but apparently growing wild near North Salem, Westchester co. N. Y. Dr.

Samuel B. Mead.

12. ÆTHUSA. Linu.

Calyx with the margin obsolete. Petals obovate, emarginate, inflexed. Fruit ovate-globose. Carpels with 5 elevated, thick and acutely keeled ribs; the lateral ribs margined and a little broader, and surrounded by a somewhat winged keel.—Leaves much divided. General involuere none or 1-leaved; partial one 1—3 or 5 leaves. Flowers white.

Pentandria. Digynia.

T. cynapium Linn.: leaves bi- and tri-pinnate, dark green; segments ovate-lanceolate; umbels terminal.

Hab. Road sides, &c. Boston, probably introduced. Big. July, Aug. O.—Stem about a foot high, smooth. Flowers white, in many rayed umbels —Said to resemble Conium maculatum, but is smaller. Poisonous.

Foot's Parsley:

13. CNIDIUM. Cuss. De Cand.

Calyx with the margin obsolete. Petals obovate, emarginate, reflexed. Fruit roundish in the transverse section. Carpels with 5 equal winged ribs; wings membranaeous; lateral ribs margined.—General involucre various; partial one many-leaved. Flowers white or reddish. Allied to Seseli, but differs, in the membranaeous-winged ribs of the fruit, and the obsolete margin of the ealyx. Pentandria. Digynia.

T. canadensis Spreng.: stem angular, flexuous; leaves bipinnate, shining; leafets many-parted; segments lanceolate; involucres many-leaved.—Selinum canadense Mich. Pursh.—Apium bipinnatum Walt.

HAB. Banks of streams. Can. to Car. July. 21.-Flowers white. Pursh.

14. THASPIUM. Nutt.

Calyx with the margin 5-toothed. Petals elliptic, attenuated into a long inflexed point. Fruit not contracted at the side, subelliptic. Carpels convex, with 5 winged ribs; wings subequal; intervals grooved .- General involucre none; partial one about 3-leaved. Differs from Cnidium in its 5-toothed calyx,-petals not emarginate,-involucels 3-leaved-and in its habit. Pentandria. Digynia.

* Umbels opposite. Flowers dark purple.

1. T. atropurpureum Nutt.: stem smooth, dichotomously branched; radical leaves subcordate, simple, serrate; cauline ones ternate; leafets ovate, acute, subcordate. - Cnidium atropurpurcum Spreng. Torr.

HAB. Moist grounds. N. S. June. 21.—Stem 2—3 feet high.

Petals dark purple. Fruit small, with membranaceous wings.

** Umbels terminal. Flowers yellow.

2. T. actaifolium Nutt.: stem very tall, smooth and straight; lower leaves tri-ternate; upper ones bi-ternate; leafets oval, coarsely toothed; umbels numerous, terminal, somewhat whorled; partial involucre setaceous.-Ligusticum actaifolium Mich. Torr.

HAB. Can. to Car. July. 21.—Stem 3-4 fect high. Fruit oblong-oval, with the ribs somewhat winged.

3. T. barbinode Nutt.: petioles and nodes of the stem pubescent; lower leaves tri-ternate; upper ones bi-ternate; segments cuneateovate, acute, unequally and incisely serrate, entire at the base; partial involucre 3-leaved, setaceous.—Ligusticum barbinode Mich.—Smyrnium barbinode Muhl.—Thapsia trifoliata Spreng. Terr.

HAB. Banks of the Schuylkill, near Philadelphia. Nutt.

2-3 feet high. Flowers yellow, in a terminal umbel.

15. LIGUSTICUM. Linn.

Calyx with the margin 5-toothed or obsolete. Petals obovate, acute, emarginate, inflexed; claw very short. Fruit roundish in the transverse section, or slightly laterally compressed. Carpels with 5 equal and somewhat winged ribs; the lateral ones margined.—Involucre various—partial one many-leaved. Flowers white. Pentandria. Digunia.

L. scoticum Linn.: stem erect, smooth and striate; lower leaves biternate; upper ones ternate and nearly sessile; leafets broadly ovate, coarsely serrate; umbels many-rayed; flowers equal; petals inflexed; involucres linear-lanceolate, 5-7-leaved.

HAB. Borders of salt marshes. Salem, Mass. Big. Aug. 21. -Stem 12-18 inches high. Flowers white. Identical with the foreign plant. Sea Lovage.

16. ANGELICA. Linn.

Calyx with the margin obsolete. Petals lanceolate, entire acuminate, with a straight or incurved point. Fruit eompressed on the back, with the central raphe two-winged on each side. Carpels with 3-dorsal filiform elevated ribs; the 2 lateral ribs dilated into a membranaceous wing.—Umbels terminal. General involucre none or few-leaved; partial one many-leaved. Flowers white. Pentandria. Digynia.

- 1. A. triquinata Mich.: stem terete, pubescent above; leaves on long petioles, ternate, the partitions quinate; leafets oblong-ovate, equally serrate, smooth; lower ones 2-lobed at the base; general involuere none; partial one of 6-8 subulate leaves, directed to one side.—A. hirsuta Muhl.—Ferula villosa Walt.
 - HAR. Dry grounds. N. Y. to Car. July, Aug. 24.—Stem 2—3 feet high, erect and straight, white, villous below the umbel. Leafets ovate or subrhomboidal. Umbels mostly 3. Flowers numerous, white.
- 2. A. atropurpurca Linn.: stem large, smooth, coloured; leaves ternate, on large inflated sheathing petioles; partitions subquinate; leafets large, oblong-ovate, coarsely serrate, sublobed; the three terminal ones often united at base; general involucre none; partial one of 8—10 subulate leaves.—A. triquinata Big.
 - HAR. Wet meadows. June. 21.—Stem 3—6 feet high, purplish. (Dr. Darlington says it is often nearly the size of a man's arm at base.) Flowers white.—This, undoubtedly, is the A. atropurpurea of most of our American botanists, except Dr. Bigelow; but whether it be the true Linnæan plant I have no means of determining. Our A. atropurpurea is much larger than A. triquinata, has its leafets large and ovate-oblong, instead of small and ovate. Plant powerfully aromatic. Root poisonous.

Common Angelica.

3. A. lucida Linn.: stem erect, glabrous; leaves bi- and tri-pinnate; leafets equal, ovate, cuneate at base, incisely serrate; general involucre about 5-leaved; partial one subulate.—Inperatoria lucida Nutt.?

HAE. Shady woods. Can. to Car. Pursh. June, July. 21.— Stem 1—2 feet high. Flowers white. Root aromatic.

17. ARCHEMORA. De Cand.

Calyx with the margin 5-toothed. Petals obcordate, inflexed. Fruit dorsally compressed, flat, oval or obovate. Carpels with 5 subcarinate equidistant filiform ribs; lateral ribs dilated into a membranaeeous margin nearly as broad as the seed.—General involucre none or few-leaved; partial one many-leaved. Flowers white.—Has the habit of Enanthe or Sium; the fruit of Pastinaca. Pentandria. Digynia.

1. A. rigida De Cand.: stem erect, rigid, striate; leaves pinnate, smooth; leafets 4—5 pairs, large, oblong-lanceolate, entire or with several remote teeth; umbels terminal, on long peduncles; general involucre none; partial one of 6—8 subulate leaves; fruit much compressed.—Sium rigidius Linn.—Sium marginatum Mich.—Pustinaca rigida Spreng. Torr.—Œnanthe rigida Nutt.

HAB. Swamps. N. J. to S. Car. Sept. 21.—Stem 2-4 feet high. Laces with a white and sometimes scabrous margin.

Flowers white.

2. A. ambigua De Cand.: stem erect, slightly angular; leaves pinnate, smooth; leafets narrow-linear or linear-lanceolate, long, mostly entire, somewhat glaucous beneath; umbels terminal, subsolitary; general involucre none; partial one of 3—5 subulate leaves.— Enanthe ambigua Nutt.—Pastinaca ambigua Torr.—Sium longifolium Pursh.

HAR. Brackish swamps. N. J. Aug. 21.—Stem 3—5 feet high. Flowers white.—Dr. Torrey considers this plant identical with Enanthe ambigua of Nuttall; while according to the latter botanist it is undoubtedly Sium lineare of Linnæus. The principal difference between the present plant as characterized by Torrey and S. lineare, consists in the absence of the general involucre. Dr. Asa Gray informs me that this species has been found in the sandy swamps of Michigan.

18. PASTINACA. Linn.

Calyx with the margin obsolete or minutely denticulate. Petals roundish, entire, involute. Fruit dorsally and flatly compressed, surrounded by a dilated margin. Carpels with very slender ribs; 3 intermediate ribs equidistant; 2 lateral ones contiguous.—Umbels compound. Involucres none or few-leaved. Flowers yellow. Pentandria. Digynia.

P. sativa Linn.: stem smooth, sulcate; leaves pinnate; leafets sessile, subpubescent beneath, oblong, incised, terminal one 3-lobed; umbels large, terminal; fruit oval, much compressed.

Hab. Fields. July, Aug. O.—Stem 2—3 feet high. Flowers yellow. Introduced. Wild Parsnip.

19. HERACLEUM. Linn.

Calyx 5-toothed. Petals obovate, emarginate, inflexed; outer ones often rayed, bifid. Fruit dorsally and flatly compressed, surrounded by a membranaceous margin. Carpels with 3 equidistant ribs on the back; 2 lateral ribs with a dilated margin.—Umbels many-rayed. General involucre caducous, often few-leaved; partial one many-leaved.

Pentandria. Digynia.

II. lanatum Mich.: stem sulcate, pubescent; leafets ternate, petioled, tomentose beneath; leafets petioled, round-cordate, lobed; partial involuere 5—6 leaved; fruit orbicular.

HAB. Meadows. June. 21.—Stem 3—5 feet high. Petioles very broad and membranous. Flowers white, in very large terminal umbels.—One of our largest umbelliferous plants. Sprengel considers it identical with the foreign H. panaces Linn.

Cow Parsnip.

20. DAUCUS. Linn.

Calyx with the margin 5-toothed. Petals obovate, emarginate, inflexed; outer ones often rayed and deeply bifid. Fruit somewhat laterally compressed, ovate or oblong. Carpels with 5 primary filiform ribs; 3 intermediate dorsal ones, 2 lateral flat, placed on the commissure; 4 secondary ones equal, with prominent wings, parted into a simple aculeate series.—General involucre with many pinnate or pinnatifid leaves; partial one with many entire or trifid leafets. Flowers white or yellow.

Pentandria. Digynia.

D. carota Linn.: stem erect, hispid; leaves tripinnate; leafets incised, linear-lanceolate, acute; umbel at length concave; fruit bristly.

Hab. Old fields. June—Aug. O.—Stem 2 feet. Flowers white.
Introduced. Wild Carrot.

SUBORDER II. CAMPYLOSPERMÆ.

Albumen involute.

21. CHÆROPHYLLUM. Linn.

Calyx with the margin obsolete. Petals obovate, emarginate, inflexed. Fruit not beaked, laterally contracted or compressed. Carpels with 5 obtuse equal ribs; lateral ribs margined.—General involucre none or few-leaved; partial one many-leaved. Flowers white, sometimes reddish.

Pentandria. Digynia.

C. procumbens Lam.: stem procumbent, somewhat hairy; leaves bipinnate; segments lanceolate, rather obtuse; umbels terminal, 3-rayed; partial involucre of 4—5 ovate ciliate leaves; fruit prismatic, smooth, crowned with the persistent styles.—Scandix procumbens Linn.—Myrrhis procumbens and M. bifida Spreng.

Hab. In shady situations. N. Y. to S. Car. May. Q.—Stem 6-8 inches high. Umbel bifid, few-flowered. Flowers small,

white.

22. OSMORHIZA. Raf.

Calyx with the margin obsolete. Petals ovate, scarcely emarginate, with a very short inflexed point. Fruit elongated, 13*

attenuated at base, solid, acute-angled, in the transverse section roundish. Carpels with hispid angles and 5 acute ribs; commissure sulcate.—General involucre 2—3-leaved; partial one often 5-leaved. Flowers white; central ones sterile; outer ones fertile.

Pentandria. Digynia.

1. O. longistylis De Cand.: stem smooth and striate; leaves biternate; the lower ones on short petioles; leafets ovate, incisely lobed and dentate; umbel 3-4-rayed.—Myrrhis longistylis Torr.—Uraspermum claytoni Nutt.—Scandix dulcis Muhl.

Hab. Wet meadows. N. S. June. 21.—Stem 3 feet high.—Can be most easily distinguished by its long subulate styles.

2. O. brevistylis De Cand.: stem hairy (at first hoary-white); leaves biternate, pubescent; leafets incisely lobed, dentate; umbel 3-rayed; styles very short.—Myrrhis claytoni Torr.—Uraspermum hirsutum Big.?

HAB. Shady rocks. Can. to Car. May, June. 24.—Stem 2 feet high. Flowers white. Whole plant sweet tasted.

Sweet Cicily.

23. CONIUM. Linn.

Calyx with the margin obsolete. Petals obcordate, somewhat emarginate, very short and inflexed. Fruit ovate, laterally compressed. Carpels with 5 prominent equal, undulate ribs; the lateral ribs margined.—Involucres 3—5-leaved; partial one dimidiate. Flowers white, all fertile.

Pentandria. Digynia.

C. maculatum Linn.: stem erect, branched, smooth and spotted; leaves large, tripinnate; leafets lanceolate, pinnatifid; ultimate segments lanceolate, mostly entire; general and partial umbels manyrayed; general involucre of several short lanceolate leaves; partial one few-leaved, setaceous, directed to one side.

Hab. Road sides. Can. and N. S. July. 7.—Stem 2—4 feet high. Leaves smooth and shining. Flowers white, numerous. Probably introduced. Whole plant highly poisonous; fetid when bruised. Medicinal.—Big. Med. Bot. i. 113.—Raf. Med. Fl. i. 118.

ORDER LIX. ARALIACEÆ. De Cand. Lind.

Calyx superior, entire or toothed. Petals definite, 5 or 6, deciduous. Stamens definite, 5 or 6 or 10 or 12, arising from within the border of the calyx, and from without an epiginous disk. Ovary inferior, with many cells; ovules solitary, pendulous; styles equal in number to the cells; stigmas simple. Fruit succulent or dry, consisting of several 1-seeded cells. Seeds solitary, pendulous.

Trees, shrubs or herbaceous plants with the habit of umbelliferæ.

1. ARALIA. Linn.

Calyx 5-toothed or entire. Corol 5-petalled. Stamens 5, often more. Styles 5, spreading. Berry 5—10-seeded, crowned with the styles.—Umbels often with small involucres.

Pentandria. Pentagynia.

1. A. nudicaulis Linn.: nearly stemless; leaf mostly solitary, triquinate; leafets sessile, oblong-oval, acute, serrate, smooth; scape naked, shorter than the leaf, 3-cleft at the top; umbels few, small, on long peduncles, without involucres.

HAB. Rocky woods. Can. to Car. N. to Arc. Amer. W. to Rocky mountains. June, July. 21.—Root thick and creeping, aromatic. Flowers small, 3-umbelled, greenish. Wild Sarsaparila.

2. A. racemosa Linn.; stem herbaeeous, branched; petioles 3-parted; divisions ternate and quinate; leafets ovate, often cordate, acuminate, sharply serrate, mostly smooth; umbels numerous, compound, in large axillary panicles; involucre small, few-leaved.

HAB. Woods. Can. to Car. W. to Rocky mountains. June
—Aug. 5.—Stem 3—4 feet high. Flowers white.—The root
is highly aromatic, and is sometimes used for medicinal purposes. Spikenard.

3. A. hispida Mich.: low, suffruticose; stem and petioles hispid; leaves doubly pinnate; leafets ovate, sharply serrate, unarmed; umbels axillary and terminal, on long peduncles.

IIAB. Rocky woods. Can to Virg. July. 5.—Stem a foot and a half high, with stiff and thick bristles at the base. Flowers greenish-white.

Wild Elder.

4. A. spinosa Linn.: arborescent; stem and leaves spinous; leaves doubly pinnate; leafets ovate-acuminate, sessile; umbels numerous, in compound panicles; involucre small, few-leaved.

Hab. Fertile woods. Penn. to Geor. W. to Miss. Aug., Sept. 7.—Shrub 8—12 feet high, with the leaves crowded at the summit. Flowers white, in very large terminal panicles.—A watery infusion of the bark is said to be both emetic and cathartic. Ell. Sk. i. 373.

Angelica Tree.

2. PANAX. Linn.

Calyx with the margin very short and obsoletely 5-toothed. Petals 5. Stamens 5, inserted under the margin of the disk and alternating with the sepals. Styles 2—3, short. Fruit fleshy, compressed, orbiculate or didymous, 2-celled; cells 1-seeded.—Flowers in simple umbels, polygamous.

Pentandria. Digynia.

1. P. quinquefolium Linn.: root fusiform; stem angular; leaves ternate-quinate; leafets oval, acuminate, petioled, serrate; peduncles shorter than the petioles; styles and seeds 2.

Hab. Mountains. Can to Geor. June. 24.—Stem 12 inches high. Flowers greenish.—Highly esteemed by the Chinese for its supposed medicinal properties.—Big. Med. Bot. ii. 82.

Ginsena

2. P. trifolium Linn.: root tuberous, roundish; stem simple, smooth; leaves ternate; leafets subsessile, oblong-lanceolate, serrate; styles often 3; berry 3-seeded.

Hab. Woods. Can. to Geor. May. 21.—Stem 4—6 inches high.

Leaves ternate or quinate.

Dwarf Ginseng.

ORDER LX. HAMAMELIDEÆ. De Cand. Lind.

Calyx superior, in 4 pieces. Petals 4, linear, with a valvular æstivation. Stamens 8, of which 4 are alternate with the petals, anthers turned inwards, 2-celled, each all opening by a valve which is finally deciduous, and 4 are sterile, and placed at the base of the petals. Ovary 2-celled, inferior. Styles 2. Fruit half inferior, capsular, usually opening with two septiferous valves. Seeds pendulous. Embryo in the midst of fleshy albumen.

Shrubs, with deciduous alternate leaves and small axillary flowers.

1. HAMAMELIS. Linn.

Calyx 4-lobed, with 2—3 scales (an involucre) externally at base. Petals 4, long, ligulate, alternating with the lobes of the calyx. Stamens 4, with very short filaments. Capsule coriaceous, 2-celled, 2-valved at the top; valves bifid.

Tetrandria. Digynia.

H. virginica Linn.: leaves ovate, acute, toothed, cordate, with the sinus small; flowers in axillary clusters.

b. parvifolia Nutt.: leaves oblong-ovate; upper part undulately and coarsely crenate; under surface pubescent, somewhat hirsute; segments of the calyx oblong; stamens and perigynous filaments often nearly equal.

Hab. Woods. Can to Flor. Oct., Nov. b.—Shrub 6—12 feet high. Flowers yellow and continue during a great part of the winter.—Var. b. is found on mountains in Penn. and is smaller than the common variety. Nutt. Witch-hazel.

ORDER LXI. CORNEÆ. De Cand.

Calyx 4-lobed. Petals 4, oblong, broad at the base, regular, inserted on the top of the tube of the calyx; æstivation

valvate. Stamens 4, alternate with the petals, inserted with them; anthers 2-celled. Ovary closely-cohering with the tube of the calyx, 2-celled; ovules pendulous, solitary; style filiform; stigma simple. Fruit fleshy, crowned by the remains of the calyx, 2-celled, (or rarely 1-celled by abortion,) endocarp thick and bony. Seeds solitary, pendulous; albumen fleshy; embryo straight; radicle superior, shorter than the oblong cotyledons.

Trees, shrubs or herbs. Leaves opposite, rarely alternate.

1. CORNUS. Linn.

Calyx with the tube adnate to the ovary, the limb very small and 4-toothed. Petals 4, oblong. Stamens 4. Style 1. Drupe with a 2-celled nut. Tetandria. Monogynia.

* Howers capitate, surrounded by an involucre.

1. C. eanudensis Linn.: herbaceous; lower leaves opposite, small; upper ones verticillate, veincd; leaves of the involucre ovate, acuminate, white; flowers numerous, very small, in a terminal head; drupe globose.

HAB. Woods. Arc. Amer. to Car. May, June. 24.—Stem 6 inches high. Involuere white. Flowers reddish-white. Drupe

2. C. florida Linn.: arborescent; leaves opposite, ovate-acuminate, entire, ribbed; leaves of the involucre 4, large, obcordate, nerved, white; flowers in terminal heads.

HAB. Woods. Can. to Car. May, June. 5.—A tree 15—20 feet high. Flowers greenish-yellow. Involuere very large, white. Drupe scarlet. Medicinal. Big. Med. Bot. ii. 73.

Dog Wood.

** Flowers naked, in cymes.

† Leaves opposite.

3. C. circinata L'Herit.: branches warty; leaves on short petioles, broad-oval, acuminate, white-downy beneath; cymes crowded, depressed; drupe globose.—C. tomentulosa Mich.—C. rugosa Lam.

Hab. Banks of streams. Can. to Virg. June, July. 5.—
Shrub 6—8 feet high. Leaves broad, waved on the edges. Flowers white. Drupe blue.

4. C. serieca L'Herit.: branches expanded; leaves ovate, acuminate, the under surface clothed with a silky ferruginous down; cymcs depressed, woolly.—C. tanuginosa Mich.—C. alba Walt.

HAB. Banks of streams. Can. to Car. June. 5.—Shrub 5—10 feet high. Leaves oblong, sometimes slightly cordate. Drupe bright blue.

5. C. sanguinea L'Herit.: branches straight; leaves ovate, green on both sides, pubescent beneath; cymes expanding.

HAE. Low grounds. Can. to Car. June, July. 5.—Shrub 8—12 feet high. Branches pubescent when young. Leaves broad, often oval. Drupe dark brown.

6. C. stricta L'Herit.: branches stiff and straight, fastigiate; leaves ovate-lanceolate, acuminate, entire, green on both sides, somewhat naked; cymes panieled.—C. fastigiata Mich.—C. sanguinea Walt.

Hab. Banks of streams. Can. to Car. June. 7.—Shrub 8—12 feet high, stoloniferous. Cymes naked, sometimes paniculate. Flowers white. Drupe blue.

7. C. alba L'Herit.: branches recurved, smooth; leaves broadovate, acute, pubescent, hoary beneath; cymes depressed, slightly pubescent.—C. stolonifera Mich.

Hab. Wet woods. Can. and N. S. N. to Arc. Amer. May—July. 5.—Shrub 6—10 feet high. Cymes small. Drupe white

or lead-coloured.

8. C. paniculata L'Herit.: branches erect; leaves ovate, acuminate, sometimes lanceolate-ovate, hoary beneath; cymes panicled.—C. racemosa Lam.

Hab. Wet woods. July. 5.—Shrub 6—10 feet high. Flowers in compact panicles, white. Drupe white, nearly globose.

†† Leaves alternate.

9. C. alternifolia Linn.: branches warty; leaves alternate, ovate, acute, hoary beneath; cymes depressed, expanding.

Hab. Shady woods. Can. to Car. June. 5.—Small tree, 15—20 feet high. Leaves on slender petioles. Drupe purple.

ORDER LXII. LORANTHACEÆ. De Cand.

Calyx with 2 bracts at base. Petals 4—8, more or less united; estivation valvate. Stamens as many as the petals, and opposite to them. Ovary 1-celled; ovule pendulous; style I or none; stigma simple. Fruit fleshy, 1-celled; endocarp membranaceous. Seed 1, pendulous; embryo straight in the axis of fleshy albumen; radicle superior, next to the hilum.

Skrubs, almost parasitical. Leaves fleshy, entire, opposite, rarely alternate or wanting.

1. VISCUM. Linn.

Flowers monoecious or dioecious. Calyx with the margin entire or a little prominent. Sterile Fl. Petals 4, (rarely 3 or 5) united at base. Anthers 4, adnate with the petals.

Fertile Fl. Petals 4, distinct. Germ crowned with the margin of the calyx. Stigma 1, obtuse, sessile. Berry globose, mucilaginous, 1-seeded. Dioecia. Tetrandria.

V. flavescens Pursh: branches terete, opposite and verticillate; leaves cuneate-obovate, 3-nerved; spikes axillary, solitary, about as long as the leaves; sterile flowers mostly trifid.—V. verticillatum Nutt.

HAB. Parasitic on trees. N. J. to Car. and throughout the valley of the Mississippi. Berries white and diaphanous. Misseltoc.

ORDER LXIII. CAPRIFOLIACEÆ. De Cand.

Calyx with its limb 5- (very rarely 4-) lobed. Corol monopetalous, lobed, sometimes irregular, the divisions alternate with those of the calyx. Stamens as many as the lobes of the corol, and (sometimes 1 abortive) alternating with them; filaments subulate; anthers ovate, 2-celled. Ovary cohering with the calyx, 3-rarely 4—5-celled; ovules few in each cell, pendulous; style 1, exserted. Stigmas as many as the cells. Fruit crowned by the limb of the calyx, fleshy, or rarely almost dry, 1 or many-celled. Seeds solitary, in pairs or several; embryo straight, in fleshy albumen; radicle superior.

Shrubs, with opposite leaves destitute of stipules. Flowers

terminal, corymbose or axillary.

1. SAMBUCUS. Linn.

Calyx minute, 5-cleft. Corol subrotate, 5-cleft, with the lobes obtuse. Stamens 5. Style none. Stigmas 3, sessile. Berry roundish, 1-celled, 3-5-seeded.

Pentandria. Trigynia.

1. S. canadensis Linn.: stem frutescent; leaves pinnate; leafets 4 or 5 pairs, oblong-oval, acuminate, smooth and shining; nerves and petioles smooth; stipules wanting; cymes 5-parted, lax.

Hab. Wet grounds. Can. to Car. May, June. 5.—Shrub 5—10 feet high. Leaves sometimes bipinnate. Flowers white. Fruit oval, deep purple. Common Elder.

2. S. pubens Mich.: stem frutescent; leaves pinnate; leafets in 2 or 3 pairs, oval-lanceolate and with the petioles pubescent beneath; cymes dense, panieled or racemose.—S. pubescens Pers.

HAB. Mountains. Can. to Car. June, July. 5.—Shrub 6—8

feet high. Flowers white. Fruit small, red.

2. VIBURNUM. Linn.

Calyx with the limb small, 5-toothed and persistent. Corol rotate subcampanulate or tubular, 5-lobed. Stamens 5,

equal. Stigmas 3, sessile. Berry ovate or globose, 1-seeded, crowned by the teeth of the calyx.

Pentandria. Tryginia.

1. V. prunifolium Linn.: branches spreading, smooth; leaves obovate, nearly round and oval, very smooth, acutely serrate; petioles winged; cymes large, lateral; corol large.

Hab. Woods. N. Y. to Car. June. 5.—Shrub or small tree, 8—15 feet high. Flowers large, white. Fruit oval, dark blue.

2. V. pyrifolium Lam.: leaves ovate-oblong, somewhat acute, subserrate, smooth; petioles naked; cymes large, spreading, on angular peduncles; fruit ovate-oblong.

HAB. Mountains. N. S. May, June. 5.—Shrub 5—10 feet high. Flowers white, on large spreading cymes. Fruit red.

- 3. V. lentago Linn.: smooth; leaves broad-ovate or oval, acuminate, sharply serrate; petioles with waved margins; cymes terminal, sessile; flowers small.
 - Hab. Rocky banks of streams. N. Y. to Geor. June. b.— Shrub 10—15 feet high. Flowers small, white. Fruit black.
- 4. V. nudum Linn.: leaves oval-oblong, slightly acuminate, smooth above, veins and margins pubescent beneath, obsoletely crenulate; petioles naked; cymes peduncled; flowers small, crowded; fruit oval, dark blue.—V. squamatum R. & S.

Hab. Swamps. Can. to Geor. June. 5.—Shrub 8—12 feet high. Flowers white. Fruit black.

5. V. lantanoides Mich.: branches flexuous and often procumbent; leaves orbicular-cordate, abruptly acuminate, unequally serrate; nerves and petioles purverulent-tomentose; cymes closely sessile; fruit ovate.—V. lantana var. grandiflorum Ait.

Hab. Mountains. Can. and N. S. May, June. 5.—Shrub 4—8 feet high. Fruit red, black when ripe. Hobble Bush.

6. V. dentatum Linn.: nearly smooth; leaves on long petioles, orbicular-ovate, with coarse serratures, plaited; axils of the veins pubescent beneath; cymes large, terminal, peduncled; fruit nearly globose, small.—V. dentatum var. glabellum Mich.

Hab. Moist woods. Can. to Car. June. b.—Shrub 8 feet high. Flowers white, in a large expanding cyme. Fruit blue, small.

Arrow-wood.

7. V. pubescens Pursh: pubescent; leaves on very short petioles, ovate, subcordate, acuminate, dentate-serrate, villous beneath; cymes pedunculate; fruit oblong.—V. dentatum var. semitomentosum Mich.

Hab. High grounds. N. Y. to Car. June. 7.—Shrub 6 feet high. Flowers in a small cyme.

8. V. acerifolium Linn.: leaves subcordate, 3-lobed, acutely serrate, pubescent beneath; petioles without glands, hairy; cymes on long peduncles; fruit oval, compressed.

IIAB. Woods. N. Y. to Car. May, June. h.-Shrub 4-8 feet high. Flowers white. Fruit black.

9. V. oxycoccus Pursh: leaves 3-lobed, acute at the base, 3-nerved; lobes divaricate, acuminate, remotely and obtusely toothed; petioles glandular; cymes radiate; flowers of the ray large and abortive. - V. opulus var. americana Ait .- V. opuloides Muhl.

HAB. Woods. Can. and N. S. N. to Arc. Amer. May, June. b .- Shrub small, with spreading branches. Fruit large, subglobose, red, of an agreeable acid resembling that of cranberries.

10. V. edule Pursh: leaves 3-lobed, rather obtuse at the base, 3nerved; lobes very short, with acuminate-dentate serratures; petioles

glandular; cymes radiate. - V. opulus var. edule Mich.

HAB. Banks of rivers. Can. and N. Y. N. to Arc. Amer. July. 21.—A smaller and more upright shrub than the preceding; berries of the same colour and size, but when completely ripe more agreeable to eat. Pursh.

3. TRIOSTEUM. Linn.

Calyx 5-cleft; lobes linear-lanceolate, as long as the corol. Corol tubular, subequally 5-lobed, gibbous at base. Stamens 5, included. Stigma capitate. Berry 3-celled. 3-seeded, Pentandria. Monogynia. crowned by the calyx.

T. perfoliatum Linn. : leaves connate, spatulate, lanceolate, acuminate, pubescent beneath; margin undulate; flowers 1-3 in the axils of the leaves, sessile - T. majus Mich.

HAB. Rocky woods. N. Y. to Car. June. 21.—Stem 2-3 feet high. Flowers purple. Medicinal. Big. Med. Bot. i. 90.

Fever Root.

DIERVILLA. Tourn.

Calyx oblong, 5-cleft, bibracteate at base. Corol funnelform, 5-cleft, spreading, much longer than the calyx. Stamens 5, somewhat exserted. Stigma capitate. Capsule oblong, acute, not crowned, 1-celled, many-seeded.

Pentandria. Monogynia.

D. tournefortii Mich. : peduncles axillary and terminal, dichotomous, 2-3-flowered; leaves opposite, ovate, on short petioles, serrate, acuminate, smooth.—D. lutea Pursh.—D. canadensis Muhl.—Lonicera diervilla Linn.

HAB. Rocky woods. Throughout the U. S. June. 5 .- Shrub 2-3 feet high. Corol yellow.

5. LONICERA. De Cand.

Calyx 5-toothed. Corol tubular, campanulate or funnel-

form, 5-cleft, often irregularly. Stamens 5. Style filiform. Stigma capitate. Berry 3-celled, few-seeded.

Pentandria. Monogynia.

- * Flowers capitate-verticillate. Berry solitary, 3-celled, crowned by the calyx. Lonicera.
- 1. L. flava Sims: leaves ovate, glaucous beneath, with a cartilaginous margin; upper ones connate-perfoliate; spikes verticillate, terminal; corol ringent; segments oblong, obtuse.—Caprifolium flavum Ell.—C. frascri Pursh.

HAE. Catskill mountains, N. Y. S. to Car. June, July. b .-

Shrub twining, very smooth. Flowers bright yellow.

Yellow Honeysuekle.

- 2. L. hirsuta Eat.: leaves broad ovate and obovate, pubescent and ciliate, glaucous beneath; upper ones connate-perfoliate, nearly smooth; spikes verticillate, terminal, subcapitate, glandular-pubescent.—Caprifolium pubescens Goldic.
 - Hab. Rocky woods. N. S. June. 5.—Shrub climbing. Flowers yellow, pubescent. Berries orange. Distinct from the preceding.

 Rough Woodbine.
- 3. L. parviflora Lam.: leaves deciduous, glaucous beneath, all connate-perfoliate; spikes verticillate, in heads, subsessile; corol ringent; gibbous at base; filaments bearded.—Caprifolium parviflorum Pursh.—C. bracteosum Mich.
 - Hab. Rocky woods. N. Y. to Car. N. to Subarc. Amer. June, July. 5.—Shrub twining. Flowers yellow, smaller than in either of the preceding.
- 4. L. grata Ait.: leaves perennial, obovate, slightly mucronate, reticulate and paler beneath; upper ones connate-perfoliate; spikes verticillate, approximate; corol ringent, with the tube long.—Caprifolium gratum Pursh.

Hab. Mountains. N. Y. to Car. June—Sept. β.—Shrub climbing or erect. Flowers scarlet.

5. L. sempervirens Ait.: leaves oblong, glaucous beneath, shining above, the upper ones connate-perfoliate; spikes verticillate, somewhat naked, terminal; corol nearly equal, with the tube ventricose above.—Caprifolium sempervirens Mich.

Hab. Stony dry woods. N. Y. to Car. May—Aug. h.—Shrub climbing. Leaves evergreen. Flowers crimson.

- ** Pedicels axillary, in pairs. Berries in pairs, distinct or more or less connate, 2-celled, many-seeded. XYLOSTEUM.
- 6. L. ciliata Muhl: stem erect; leaves opposite, ovate and subcordate, ciliate on the margin, younger ones villous beneath; tube of the corol calcarate at base, ventricose above; segments short, acute; style exserted; berries distinct.—Xylosteum ciliatum Pursh. Torr.

HAB. Hills and rocks. Can. and N. S. May, June. P.—Shrub 2—4 feet high. Corol yellow, long, bilabiate. Berries ovate, red. Fly Honeysuckle.

7. L. villosa Muhl.: leaves oblong and oval, obtuse; the younger ones as well as the corol villous; peduncles much shorter than the flower; berries coadnate.—Xylostcum villosum Mich.—X. solonis Eut.—X. oblongifolium Goldie.

HAB. Mountains. Hudson's bay to N. J. May. 5.—Skrub 2—4 feet high. Flowers axillary, yellow. Berries red or purple.

6. SYMPHORIA. Pers.

Calyx minute, 4—5-toothed. Corol funnel-form, subequally 4—5-lobed. Stamens 5, scarcely exserted. Stigma subglobose. Berry crowned by the calyx, 4-celled, 4-seeded; 2 of the cells sometimes abortive. Pentandria. Monogynia.

1. S. glomerata Pursh: racemes axillary, capitate, glomerate; leaves opposite, ovate, on short petioles; flowers small, numerous.—S. vulgaris Mich.—Symphoricarpos vulgaris De Cand.

HAB. Sandy fields. Penn. to Car. July, Aug. 5 .- Shrub 3-4

feet high. Corol red and yellow. Berries purple.

2. S. racemosa Pursh: racemes terminal; corol bearded within: leaves elliptical ovate, opposite.—Symphoricarpos racemosus Mich.

HAB. Niagara Falls. N. Y. W. to Miss. July. 5.—Shrub 2—3 feet high. Corol pale red. Berries large, white.

7. LINNÆA. Gron.

Calyx with the tube ovate; limb 5-parted; segments lanceolate-subulate. Corol turbinate, subcampanulate, 5-lobed. Stamens 4, subdidynamous, included. Stigmas globose. Berry dry, small, ovate-globose, 3-celled, (one cell only bearing a perfect seed.)

Tetrandria. Monogynia.

L. horcalis Gron.

HAB. Woods and hills. N. S. N. to Arc. Amer. July. 21.— Evergreen, creeping. Leaves opposite, on short petioles, roundovate, crenate, slightly hairy. Peduncles erect, long. Flowers 2, drooping, pedicelled, white or pale red. Twin Flower.

ORDER LXIV. RUBIACEÆ. De Cand.

Tube of the calyx adhering to the ovary; the limb variable, truncate or lobed, consisting of as many sepals as petals, rarely with accessary intermediate teeth. Petals 4—5, rarely 3—S, united, inserted on the top of the tube of the calyx. Stamens as many as the lobes of the corol and alternate with them; anthers oval, 2-celled, turned inwards. Ovary 2—many

celled, (by abortion 1-celled) crowned by a fleshy urceolate disk; style single, sometimes partly divided; stigmas usually 2, rarely several. Fruit splitting into 2 cocci, or capsular, or baccate, or drupaceous, 2 or many-celled. Seeds one or many in each cell. Albumen copious, horny or fleshy; embryo straight or slightly curved; radicle turned to the hilum; cotyledons leafy.

Trees, shrubs or herbs. Leaves simple, entire, opposite,

rarely verticillate.

1. HEDYOTIS. Linn.

Calyx 4-toothed, or 4-parted. Corol tubular, bearded at the throat, 4-parted. Stamens 4, somewhat exserted. Capsule ovate, 2-celled, opening transversely at the top, many-seeded; dissepiment contrary to the valves.

Tetrandria. Monogynia.

H. glomerata Ell.: stem procumbent, assurgent, pubescent; leaves opposite, lanceolate, attenuate at base, pubescent; flowers in clusters, sessile, axillary and terminal.—H. auriculata Walt.—Oldenlandia glomerata Mich.

HAB. Damp grounds. N. J. to Car. Aug. © ?—Stem 1-3 inches high. Flowers white, minute, in clusters forming whorls.

2. MITCHELLA. Linn.

Flowers by pairs upon the same germ, superior. Calyx 4-toothed. Corol funnel-form; tube cylindric; limb 4-parted, spreading, villous on the inner side. Stamens 4, adnate to the tube, scarcely exserted. Stigma 4-cleft. Berry by the union of 2 germs, didymous, 4-seeded.

Tetrandria. Monogynia.

M. repens Linn.: stem branched, smooth, creeping; leaves opposite, petioled, round or ovate, cordate at the base, smooth, very entire; flowers terminal, in pairs on each germ; calyx minute.

Hab. Woods, among dried leaves. Can. to Geor. June, July.
 2.—A small, evergreen, creeping plant. Flowers white, hairy within, fragrant. Berries red. Partridge Berry.

3. CEPHALANTHUS. Linn.

Common calyx none; proper superior, small and angular, 4-cleft. Corol tubular, slender, 4-cleft. Style much exserted. Stigma globose. Capsule 2-celled, 2-seeded, (mostly 2 partile.) Receptacle globose, hairy.—Flowers in a globose head.

Tetrandria. Monogynia.

C. occidentalis Linn.: leaves opposite or ternate, ovate or oval, acuminate; peduncles much larger than the head of flowers.

Hab. Borders of ponds and streams. Can to Flor. W. to Miss. July, Aug. 5.—Shrub 4—5 feet high, branched. Leaves ovate-oblong, petioled, smooth. Flowers in heads, white.

Button Bush.

4. DIODIA. Linn.

Calyx with the tube ovate or obovate, often 8-nerved; 2—4-toothed. Corol funnel-form, 4-lobed. Stamens 4, exserted or included. Style bifid or undivided. Fruit crowned with the calyx, 2-celled, bipartile; carpels 1-seeded.

Tetrandria. Monogynia.

1. D. tores Walt.: stem procumbent, diffuse, terete, hairy; leaves linear-lanceolate, nearly smooth, margin and keel serrulate; stipules with numerous long bristles; flowers axillary, solitary, alternate; corol bearded within; fruit ovate, pubescent, crowned by the 4-lobed calyx.—Spermacoce diodina Mich.

Hab. Sandy fields. N. J. to Car. Aug. . Stem 6-8 inches long. Flowers opposite, often clustered, white or pale purple.

2. D. virginica Linn.: smooth; stem procumbent, nearly terete; leaves lanceolate, opposite, acute, scabrous on the margin; corol nearly smooth within; fruit oblong, smooth, crowned by the 2-lobed calyx.

HAB. Damp soils. Md. to Car. Sept. 21.—Stem smooth, slender, purple. Flowers white, solitary, opposite.

5. GALIUM. Linn.

Calyx with the tube ovate-globose or oblong; limb nearly wanting. Corol 4-parted, rotate, (very rarely 3-parted.) Stamens short. Styles 2, short. Fruit didymous, roundish, rarely oblong. Tetrandria. Monogynia.

* Fruit smooth, Flowers yellow.

1. G. verum Linn.: leaves about 8 in a whorl, linear, grooved, entire; flowers in dense panicles.

HAB. Pastures. N. S. June, July. 21.—Stem erect, 9—18 inches high, slender, branched. Leaves linear, deflexed, roundish. Flowers yellow. Introduced? Yellow Bedstraw.

** Fruit smooth. Flowers white.

2. G. trifidum Linn.: stem procumbent, scabrous downward; leaves 4—6 in a whorl, linear, obtuse, scabrous on the margin and midrib; peduncles smooth, spreading, 3-cleft; corol 3—4-cleft.—G. claytoni Mich.

HAB. Swamps and wet fields. Can. to Car. N. to Arc. Amer. June, July. 24.—Stems procumbent and assurgent, much branch-

- ed. Flowers in threes, white, very minute.—It varies with obovate-cuneate leaves.

 Small Cleavers.
- 3. G. tinctorium Linn.: stem diffuse, smoothish; leaves linear, somewhat acute; those of the stem in sixes; of the branches in fours; peduneles terminal, elongated, mostly 3-flowered.

HAB. Wet woods. N. S. June—Aug. 21.—Stem weak, branching. Leaves very narrow. Corol white, mostly 4-cleft. Used as a red dye.

Dyer's Cleavers.

4. G. obtusum Big.: stem smooth, procumbent; leaves in fours, oblaneeolate, obtuse, rough on the edge and midrib; peduncles slender, 3-flowered; lobes of the corol acute; fruit smooth, globose.

HAB. Banks of streams. Mass. Big. July. 21.—Stem much branched, entire, smooth. Leaves very obtuse. Flowers white.
—Plant larger and more open than G. tinctorium.

5. G. asprellum Mich.: stem diffuse, very branching, aculeate back wards; leaves in fives and sixes, lanceolate, acuminate, their margins and nerves aculeate; pedicels short.

HAB. Moist places. Can. to Virg. June, July. 21.—Stem 1-2 feet high. Flowers white, minute.

*** Fruit hispid.

6. G. aparine Linn.: stem weak, branching, aculeate backwards: leaves 6-8 in a whorl, linear-lanceolate, mucronate, with the keel and margin rough with reflexed prickles; fruit with hooked bristles.

HAB. Moist woods. N. S. June. Q.—Stem 3—4 feet long. Flowers white, numerous, on axillary and terminal peduncles.

7. G. micranthum Pursh: stem very branching, divaricate, with reflexed prickles; leaves short, lanceolate, mucronate, smooth, their margin and keel aculeate; flowering branches divaricate; pedicels sub-2-flowered, hispid.

Han. Mountain swamps. Can. and N. J. July. 21.—Flowers white, and very minute. Fruit mostly 1-seeded. Pursh.

8. G. brachiatum Pursh: stem flaccid, elongated, brachiate-ramose; branches short; leaves in sixes, oblong-lanceolate, acuminate, smooth, their margin and keel setaceously-ciliate; flower bearing branches longer than the whorls, divaricate and dichotomous; pedicels 2-flowered; fruit with hooked bristles.

HAB. Woods and meadows. N. S. June—Aug. 21.—Flowers white. Pursh.—Perhaps not distinct from G. aparine.

9. G. triflorum Mich.: stem procumbent, smoothish; leaves in fives and sixes, obovate-lanceolate, mucronate, glabrous, margin scarcely ciliate; flowering branches long, 3-flowered at the summit; flowers on short pedieels; fruit small, hispid.—G. cuspidatum Muhl. Ell.

Hab. Moist woods. Can. to Car. July, Aug. 24.—Stem weak, 3—5 feet long. Flowers white, very small.

10. G. puncticulosum Mich.: stem erect, very branching, seareely pubescent; leaves in fours, ovate, obtuse, smooth, with pellucid dots;

margin and nerves pubescent; flowering branches elongated; fruit with hooked bristles.—G. bermudianum Pursh not of Linn.?

- HAB. In wet places. Penn. to Car. June. 24.—Stem erect, nearly smooth. Flowers purple.
- 11. G. pilosum Ait.: stem nearly simple, elongated, ascending, with remote joints, hispid; leaves in fours, oval, mucronate, very hairy on every part, nerveless; flowering branches elongated, nearly simple, 3-flowered at the extremity; fruit hairy.—G. puncticulosum var. pilosum De Cand.
 - Hab. Woods. N. Y. to Car. July, Aug. 2f.—Stem a foot high, rough. Flowers purple.—Probably not distinct from the preceding.
- 12. G. circæzans Mich.: stem erect, smooth or slightly pubescent on the angles; leaves in fours, oval, obtuse, smooth; margin and nerves ciliate; peduncles short, divaricate, few-flowered; flowers remote, subsessile, alternate; fruit nodding, with hooked bristles.—G. borcale Walt.—G. brachiatum Muhl.
 - IIAB. Rocky woods. N. Y. to Car. June, July. 21.—Stem about a foot high. Flowers purple.
- 13. G. lanceolatum Torr.: stem erect, very smooth, with remote joints; leaves in fours, lanceolate, generally acute, smooth, 3-nerved, margin subciliate; peduncles long, divaricate; fruit sessile, nodding, covered with hooked bristles.—G. torreyi Big.
 - Hab. Rocky woods. N. S. July. 21.—Stem 12—18 inches high. Flowers purple.—De Candolle considers this a variety of the former.
- 14. G. septentrionale R. & S.: stem erect, branched above, very smooth; leaves in fours, linear-acute or linear-lanceolate, 3-nerved, smooth, margin involute and scabrous; flowers in a divaricate terminal panicle; fruit with minute hooked hairs.—G. boreale Pursh. Torr.—G. strictum Eat.

Hab. Sandy woods. N. S. Aug. 24.—Stem 1 1-2—2 feet high. Flowers white, in a terminal crowded panicle.

ORDER LXV. VALERIANEÆ. De Cand. Lind.

Calyx with a limb of various kinds, either membranous or resembling pappus. Corol inserted into the top of the ovary, 3—5-lobed, regular or irregular, sometimes calcarate at the base. Stamens 1—5, inserted into the tube of the corol and alternate with its lobes. Ovary inferior, 1—3-celled; ovule solitary, pendulous; style filiform; stigmas 1—3. Fruit dry, indehiscent, with 1 fertile cell and 2 empty ones. Seed solitary, pendulous; embryo straight, destitute of albumen; radicle superior.

Herbs. Leaves opposite, without stipules.

1. VALERIANELLA. Manch. De Cand.

Calyx with the limb toothed and persistent. Corol not calcarate, regular, 5-lobed. Stamens 5. Stigmas scarcely divided or trifid. Fruit 3-celled, submembranaceous, indehiscent, crowned by the limb of the calyx; 1 or 2 of the cells only fertile.

Triandria. Monogynia.

V. radiata De Cand.: leaves spathulate-oblong, nearly entire, attenuate at base; fruit oblong, smooth, somewhat 4-sided.—Fedia radiata Mich. Pursh. Torr.

HAB. Fields. N. Y. to Car. W. to Miss. May. O.—Stem a foot high, dichotomous. Leaves opposite. Flowers small, pale blue, in fastigiate corymbs, with lanceolate bracts at base.

Wild Lamb Lettuce.

2. VALERIANA, De Cand.

Calyx with the limb involute, at length evolved in a deciduous plumose pappus. Corol with the tube obconic or cylindric, equal or gibbous at base, limb obtusely, 5-cleft. Stamens 3. Fruit indehiscent, 1-celled, 1-seeded.

Triandria. Monogynia.

V. sylvatica Rich.?: flowers triandrous, perfect; cauline leaves pinnate, acute; radical ones oblong, entire.

Hab. Spagnous swamps, near Fairhaven, Ver. June, July. 21.

—Root consisting of numerous long fibres, having the odour and probably the medicinal properties of V. officinalis. Stem 2—3 feet high, simple, smooth, erect. Radical leaves on long petioles, usually simple, but sometimes lobed at base, varying from lanceolate, to ovate and subcordate; stem leaves pinnate; leafets in 4—6 pairs with an odd one, ovate oval or somewhat rhomboidal, coarsely but sometimes very sparingly toothed. Flowers numerous, reddish-white, perfect, in a large and dense dichotomous corymb. Corol gibbous at base, 5-cleft. Stumens and pistil much exserted. Capsule ribbed, as long as the narrow and hispid bracts.—This plant agrees very well with the short description given by Dr. Richardson (App. to Frank. Jour.) of V. sylvatica, a new species found in Arctic America and Newfoundland, but it may prove distinct. From V. pauciflora it appears to differ, although I have had no opportunity of comparing specimens. It was first discovered by Dr. Robbins at the above locality, where I have since found it growing abundantly.

ORDER LXVI. DIPSACEÆ. De Cand. Lind.

Calyx with a limb short or elongated, entire or toothed, or pappose. Corol tubular, inserted into the calyx; limb oblique, 4—5-lobed, with an imbricate æstivation. Stamens usually 4 or 5, alternate with the lobes of the corol; anthers distinct.

Ovary inferior, 1-celled, with a single pendulous ovule; style 1; stigma simple. Fruit dry, indehiscent, 1-celled, crowned by the pappus-like calyx; embryo straight, in the axis of fleshy albumen; radicle superior.

Herbs or undershrubs. Leaves opposite or whorled. Flow-

ers densely capitate or very rarely whorled.

1. DIPSACUS. Linn.

Flowers collected in an ovate or roundish head. Common calyx (involucre) foliaceous, many-leaved; proper superior, of one leaf. Corol tubular, 4-cleft. Stamens 4. Stigma longitudinal. Fruit crowned with the limb of the calyx.

Tetrandria. Monogynia.

D. sylvestris Linn.: leaves opposite, rarely connate; the many-leaved involucre curved upwards; scales of the receptacle straight.

HAB. Fields and waste places. N. S. July. 7.—Stem 3—5 feet high, strong, angular, prickly. Flowers blue, in dense oval heads, shorter than the scales of the receptacle. Introduced.

Wild Teasel.

ORDER LXVII. COMPOSITE. Adans. Lind.

Calyx with the limb either wanting or membranous, and divided into bristles paleæ or hairs, and called pappus. Corol monopetalous, usually deciduous, either ligulate or tubular; in the latter case 4—5-toothed or lobed, with a valvate æstivation. Stamens 5, alternate with the teeth of the corol; filaments distinct; anthers cohering in a cylinder. Ovary inferior, 1-celled, with a single erect ovule; style single; stigmas 2, distinct or united. Fruit a small indehiscent dry pericarp, (acine) crowned with the limb of the calyx. Seed solitary, erect; embryo with a taper inferior radicle; albumen none.

Herbs or shrubs. Leaves alternate or opposite, usually simple, without stipules. Flowers (called florets) collected in dense heads upon a common receptacle, surrounded by an involucre.

SUBORDER 1. CICHORACE/E.

Obs. In the arrangement of the genera of this suborder, I have adopted Mr. Don's New Classification of the Cichoraceæ. Edin, New Phil. Jour. vi. 305. Wherever he has enumerated the species of his new genera, I have quoted him as the authority; although he has not in any case given specific descriptions.

1. HIERACIUM. Linn. Don.

Receptacle subfavose. Acines sim-Involucre imbricate. ple at the apex. Pappus with the rays numerous, persistent, setaceous-pilose, arranged in one row .- Flowers yellow, so-Syngenesia. Æqualis. litary or corymbose.

* Stemless. Scape many-flowored.

1. H. venosum Linn. : scape hairy at base, smooth and branching above; branches 1-flowered; leaves obovate-oblong, entire, a little hairy above; margins ciliate; veins coloured; involucre smooth.

HAB. Shady woods. Can. to Car. July, Aug. 21.-Scape 1-2 feet high, branching towards the summit. Leaves all radical, spreading on the ground, coloured with dark red veins. Flowers panicled, on slender pedicels, yellow. Veiny Hawkweed.

** Stem leafy, many-flowered.

2. H. gronovii Linn.: radical leaves oblong, obtuse, very entire, ciliate; cauline ones ovate and clasping; flowers in loose racemes; pedicels glandular-pilose; involucre smooth.

Hab. Dry woods. Can. to Car. July, Aug. 21.—Stem 2 feet high, nearly naked. Flowers yellow, in a long terminal panicle or raceme. - Both Pursh and Elliott have probably taken this

for the next.

3. H. marianum Willd.: stem erect, villous; leaves obovate-oblong, strigose-villous on the midrib; lower ones slightly toothed; pedicels and involucre hispid.—H. gronovii var. foliosum Pursh.—H. scabrum Mich.

HAB. Woods. Can. to Car. July, Aug. 21.—Stem 2 feet high, very rough. Flowers in a small irregular panicle, yellow. Rough Hawkweed.

- 4. H. paniculatum Willd.: stem erect, leafy, smooth above, whitish tomentose below; leaves lanceolate, oblong, few-toothed, membranaceous, naked; pedicels divaricate, capillary, 1-flowered; bracts setaceous.
 - Hab. Woods. Can. to Car. July—Sept. 21.—Stem slender, 1—2 feet high. Leaves thin, paler beneath. Flowers small, on long slender pedicels, forming a large panicle.
- 5. H. kalmii Linn.: stem erect, simple, smoothish; leaves sessile, oblong-lanceolate, acuminate, acutely and divaricately toothed; pedicels tomentose, somewhat in the form of an umbel; involucre loose.—H. virgatum and H. fascieulatum Pursh.

HAB. Rocky woods. Can. and N. S. Aug. 21 .- Stem 2 feet Leaves with acute diverging teeth. Pedicels axillary and

terminal, covered with down, thick, erect.

2. HARPALYCE. Don.

Involucre cylindric, many-leaved, in a single row, with a few very short appressed scales at base. Receptacle slightly pitted. Florets indefinite. Stigmas filiform, somewhat hispid. Acines narrow, angled, sulcate, simple at the apex. Pappus pilose, stiflly erect, fragile, persistent and coloured, with the rays crowded in a double row, denticulate-scabrous.

Syngenesia. Æqualis.

- 1. II. altissima Don: stem branching; leaves 3-lobed, petioled, angular, denticulate, scabrous on the margin; racemes axillary; flowers nodding; involucre about 5-flowered.—Prenanthes altissima Linn. Pursh.
 - IIAB. Woods. Can. to Car. Aug. 2f.—Stem 4—6 feet high, branching, glabrous. Flowers in axillary panicles or racemes, yellowish.
- 2. II. cordata Don: stem paniculate above; leaves petiolate, cordate, toothed, ciliate; the floral ones sessile, oblong, very entire; panicle loose, with the flowers somewhat racemose and nodding; involuere 6-leaved, 6-8-flowered.—Prenanthes cordata Pursh.
 - IIAB. Woods. N. Y. to Car. Aug. 21.—Stem 4—6 feet high. Leaves ovate-lanceolate, cordate. Flowers in long loose panicles, yellowish.
- 3. H. virgata Don: smooth; stem simple; leaves all lyrate and sinuate, sessile; racemes generally secund; flowers pendulous; involucre 8-leaved, 10-flowered.—Prenanthes virgata Mich.

Hab. Sandy fields. N. J. to Car. Aug., Sept. 21.—Stem 2—5 feet high. Flowers in a long terminal raceme, pale-purple.

- 4. II. alba Don: radical leaves angular-hastate, toothed and somewhat lobed; stem-leaves roundish-ovate, toothed and petioled, the upper ones lanceolate; panicle loose; fascicles terminal, nodding; involucres 8-leaved, 9—12-flowered.—Prenanthes alba Linn.
 - b. nana: stem low; lower leaves 3-parted; middle ones hastate, upper ones ovate or lanceolate; sometimes all are entire.—P. alba var. nana Big. Torr.
 - alba var. nana Big. Torr.

 Hab. Woods. N. Y. to Car. Aug. 21.—Stem 5 feet high. Flowers in a loose panicle which is composed of small terminal clusters, yellowish-white. Var. b. White mountains. Stem 4—15 inches high. Flowers in simple or panicled racenes, purple.
- 5. H. serpentaria Don: leaves toothed, rough; those of the root palmate; of the stem on long petioles, sinuate-pinnatifid, somewhat 3-lobed, the middle segment 3-parted; upper leaves lanceolate; racemes terminal, paniculate, short, nodding; involucre 8-leaved, 12-flowered.—Prenanthes serpentaria Pursh.
 - HAB. Mountain woods. N. Y. to Car. Aug. 21.—Stem 2—4 feet high, nearly glabrous. Flowers in loose terminal panicles, purple.—Resembles H. alba, and by Dr. Torrey is placed as a variety of that species. The whole genus, indeed, is so liable to variation, that it may be doubted whether many of the species usually considered distinct, are more than mere varieties. But as

Pursh has apparently investigated it with more attention than any succeeding botanist, 1 have preferred adopting his views concerning the species. H. serpentaria is said to be a cure for the bite of the rattle snake. Pursh. Lion's Foot.

6. H. racemosa Don: stem simple; leaves all undivided, smooth; radical ones oval-lanceolate; cauline ones subclasping; racemes oblong, very hairy, in nodding fascicles; involucre 8—9-leaved, 9—12-flowered.—Prenanthes racemosa Mich.

HAB. Can. Mich. N. S. Torr. Sept. 21.—Stem 2 feet high. Flowers purple.

3. LEONTODON. Schreb.

Involucre imbricate, with a few loose scales at base. Receptacle naked. Pappus simple, stipitate.

Syngenesia. Æqualis.

L. taraxacum Linn.: outer scales of the involucre reflected; leaves runcinate, smooth, the segments lanceolate and toothed; scape 1-flowered.

HAB. Pastures, &c. Throughout the U. S. April—Nov. 24.

—Leaves all radical, smooth. Scapes often several from each root, with one terminal large yellow flower. Introduced.

Dandclion.

4. OPORINIA. Don.

Involucre deeply many-parted, with a few appressed scales at base. Receptacle dotted. Anthers bisetose at base. Acines somewhat fusiform, compressed, sulcate; furrows transversely rugose. Pappus with the rays distinct, in a single row, persistent, plumose, scariose and dilated at base.—Flowers pedunculate, yellow.

Syngenesia. Equalis.

O. autumnale Don: scape branching; peduncles scaly; leaves lanceolate, toothed or pinnatifid, smoothish.—Apargia autumnale Willd.

HAB. Fields and road sides. N. S. July—Sept. 21.—Scape spreading, branching into a few peduncles which are furnished with a few remote scales. Flowers bright yellow, resembling the Dandelion. Introduced.

5. CYNTHIA. Don.

Involucre many-parted; segments in a double tow. Receptacle scrobiculate. Anthers 2-toothed at base, Stigmas linear-ligulate, pruinose. Acines oval, complanate. Pappus double; outer one chaffy, very short; inner pilose, rough.—Flowers yellow.

Syngenesia. Æqualis.

1. C. amplexicaule Beck: smooth and glaucous; scape somewhat fleshy, simple or bifid; branches 2—3-flowered; radical leaves sublyrate, spatulate; cauline ones clasping, lanceolate, entire, smooth.—

Krigia amplexicaulis Nutt.—Troximon virginicum Pursh.—Hyoscris amplexicaulis Mich.

- Hab. Wet woods. N. J. to Car. W. to Miss. June. 24.—
 Stem a foot high, resembling a scape, and divided into long slender branches. Flowers solitary at the extremity of the branches, large, orange-yellow.
- 2. C. virginica Beck: glaucous; primary leaves roundish, entire, the rest lyrate, nearly smooth; scape 1-flowered, smooth, at length longer than the leaves.—Krigia virginica Linn.—Hyoscris virginica Mich.
 - Hab. Fields and arid soils. Can. to Flor. May—Aug. . .—
 Scape 2—8 inches high. Flowers small, orange-yellow.—This plant continues in flower for some time; during which it varies greatly in the length of the scape. Krigia dichotoma of Nuttall can be nothing more than a mere variety.

6. LACTUCA. Linn.

Involucre imbricate, cylindrical; the scales membranaceous at the margin. Receptacle naked. Seeds smooth. Pappus simple, stipitate. Syngenesia. Equalis.

- 1. L. clongata Muhl.: leaves smooth beneath; the lower ones runcinate, amplexicaule; upper ones lanceolate, sessile; flowers in corymbose panicles.
 - HAB. Woods and road sides. Can. to Car. Aug. Sept. J.—Stem 3—6 feet high. Leaves long, spreading, runcinate, clasping. Panicle terminal, composed of small clusters of yellow flowers.—This plant appears on grounds newly burnt over and hence called
- 2. L. hirsuta Nutt.: lower part of the stem and leaves hirsutely pilose; radical leaves lyrate, segments truncate; the upper ones partly runcinate-pinnatifid; flowers in racemes; scales subulate.

HAB. In Pennsylvania. Muhl. Aug. 21.—Flowers yellow and purple.

- 3. L. integrifolia Big.: leaves sagittate, entire, unarmed and clasping; flowers panicled.
 - Hab. Road sides. N. S. July. 3.—Stem 3—4 feet high, round, smooth and striated. Leaves pale beneath. Flowers yellow, in a panicle which is more compact than that of L. elongata, from which Dr. Bigelow thinks it may be descended. It should not be confounded with the L. integrifolia of Nuttall, which is now removed to the genus Agathyrsus of Don.
- 4. L. sanguinea Big.: leaves clasping, runcinate, smooth beneath, with the midrib filamentous; flowers panicled.
 - HAB. Dry woods. N. S. July, Aug. 3.—Stem 2—3 feet high, erect and smooth, mostly of a reddish-purple colour. Flowers panieled, with short acuminate bracts. Involucre purple. Corol crimson.

5. L. canadensis Linn.: leaves lanceolate-ensiform, clasping, toothedy raceme compound, terminal —Sonchus pallidus Pursh. Torr.

Hab. Woods and road sides. Can. and N. S. July—Sept. 24.
—Stem 2—3 feet high. Flowers small, yellow.

6. L. villosa Jacq.: radical leaves slightly runcinate; those of the stem, ovate, acuminate, petiolate, toothed in the middle; flowers paniculate; peduncles somewhat scaly.—Sonchus acuminatus Willd.

HAB. Shady woods. Mass. to Car. Aug., Sept. 3.—Stem 3—4 feet high. Leaves attenuated at base into a winged petiole, hairy beneath. Flowers in a loose terminal panicle, purple. Peduncles with a few ovate ciliate scales. Florets about 15. Pappus stipitate.—Although this plant differs somewhat in its habit from the other species of Lactuca, it agrees more nearly with this genus, than with Sonchus.

7. AGATHYRSUS. Don.

Involucre many-leaved, terete, closely imbricate; the inner scales elongated and connivent. Receptacle very smooth. Florets indefinite. Anthers obtusely bidentate at base. Acines ancipital-compressed, 5-ribbed on each side, transversely rugulous, somewhat attenuated at the summit; disk epiginous, nearly flat, dilated. Pappus very slender, fugaceous, with the rays very numerous and arranged in a triple row—Flowers corymbose paniculate, blue.

Syngenesia. Æqualis.

1. A. leucophaus Don: stem virgate and panicled; leaves runcinate, acuminate; peduncles scaly; flowers racemose.—Sonchus leucophaus Wild. Pursh. Torr.—S. spicatus Lam.

Hab. Woods and road sides. N. S. July—Sept. 3.—Stem 2 feet high. Flowers bluish-white.

2. A. floridanus Don: stem terete; leaves petioled, lyrate-runcinate, segments oblong, acuminate, toothed; flowers paniculate; peduncles somewhat scaly.—Sonchus floridanus Linn. Pursh. Torr.

Hab. Woods and road sides. N. S. S. to Car. July—Sept. 3.—Stem erect, 3—5 feet high. Leaves narrow lanceolate, sometimes with runcinate segments. Flowers in a long slender panicle, small, blue.—Pursh states that this plant is used as a cure for the bite of the rattle snake, in the same manner as Prenanthes scrpentaria, and is called—Gall of the carth.

3. A. macrophyllus Don: ? leaves lyrate, cordate at base, very hairy beneath; petioles winged; flowers paniculate; peduncles hairy, naked—Sonchus macrophyllus Willd. and the American authors.

Hab. Springy ground. Penn. to Car. Aug., Sept. 21.—Stem 4—7 feet high. Leaves large, lyrate, very hairy beneath. Flowers blue, of the size of Cichorium intybus. Root tuberous.

8. SONCHUS. Linn. Don.

Involucre many-leaved, closely imbricate, dilated at base, connivent at the summit. Receptacle pitted, scabrous, with the elevated and torn margins of the pits slightly dotted. Florets indefinite, the mouth very villous without. Anthers acutely bidentate at base. Stigma hispid. Acines ancipital-compressed, sulcate, transversely rugose, simple at the summit, very soft, capillary, fugaceous; rays very copious, unequal, fasciculately connate at base—Flowers yellow, corymbose, rarely solitary.

Syngenesia. Equalis.

- 1. S. oleraccus Linn.: leaves oblong-lanceolate, clasping, slightly toothed and sinuate; involucre smooth; peduncles somewhat tomentose.
- 2. S. arvensis Linn.: root creeping; leaves runcinate, denticulate, cordate at base; involucre hispid; peduncles hispid, somewhat umbelled.
 - HAB. Near cultivated grounds. N. S. 21.—Stem 2 feet high. Flowers large, deep yellow. Introduced.
- 3. S, $spinulosus\ Big.:$ leaves clasping, oblong, waved, prickly; flowers somewhat umbelled.
 - HAB. Salt marshes. Mass. Aug. . Stem 2 feet high, smooth or slightly hairy. Leafets smooth, with teeth ending in short spines. Flowers somewhat umbelled, small, yellow.

9. CICHORIUM. Linn.

Involucre surrounded with leafy scales. Receptacle somewhat chaffy. Pappus plumose, sessile, unequal, shorter than than the acines. Syngenesia. Æqualis.

C. intybus Linn.: leaves runcinate; flowers axillary, sessile, in pairs.

HAE. Fields. N. S. July-Sept. 21.—Stem 2—3 feet high, with rough branches. Flowers large, blue. Introduced.

Succory.

SUBORDER II. CARDUACEÆ.

10. ARCTIUM. Linn.

Involucre globose, each of its scales with an incurved hook at the extremity. Receptacle chaffy. Pappus simple, the rays short.

Syngenesia. Æqualis.

A. lappa Linn : leaves cordate, petiolate, unarmed.

HAB. Waste grounds. N. S. July, Aug. 21.—Stem 3—4 feet high. Leaves very large, cordate and wavy. Flowers numerous, purple.—As Dr. Bigelow remarks, "this plant intrudes itself on every one's acquaintance by the sharp firm hooks at the end of the calyx scales, which attach themselves to the clothes, and serve as a remarkable mechanism for dispersing the seeds." Introduced.

Burdock.

11. CARDUUS. Linn.

Involucre ventricose, imbricate, with spinous scales. Receptacle hairy. Pappus pilose or plumose, deciduous.

Syngenesia. Æqualis.

* Leaves decurrent.

1. C. lanceolatus Linn.: stem hairy; leaves decurrent, pinnatifid, hispid; the segments divaricate and spinous; scales of the involucre lanceolate, spreading.—Cnicus lanceolatus Willd.—Cirsium lanceolatum Spreng.

HAB. Road sides. N. S. July—Sept. J.—Stem 2—4 feet high. Leaves woolly beneath, the segments armed with long and acute spines. Flowers terminal, purple, middle-sized.

** Leaves sessile.

2. C. altissimus Linn.: leaves sessile, oblong-lanceolate, scabrous, tomentose beneath, dentate-ciliate; radical ones pinnatifid; involucre ovate, bracteate; scales ovate, lanceolate, spinous, appressed.—Cnicus altissimus Willd.

HAB. Old fields. Penn. to Car. June—Sept. 21.—Stem 3—8 feet high, and on the Missouri, according to Mr. Nuttall, 12—18 feet. Flowers terminal, large, purple.

3. C. arvensis Linn.: stem paniculate; leaves sessile, pinnatifid, spinous; involucre ovate or globose; scales ovate-lanceolate, mucronate, appressed.—Cnicus arvensis Willd.

Hab. Fields and roads sides. N. S. July. 21.—Root creeping. Stem 2—3 feet high, many-flowered. Leaves very thorny. Flowers terminal, small, purple.—A very troublesome weed. Introduced.

Canada Thistle.

- 4. C. muticus Nutt.: leaves all pinnatifid, woolly beneath; segments spinulose, somewhat lanceolate, acute; branches naked, 1-flowered; involucre globose; scales unarmed.—Cnicus muticus Pursh.—Cirsium muticum Mich.
 - HAB. Mountains and low grounds. N. Y. to Car. Aug., Sept. 3.—Stem 2—4 feet high, branching above. Flowers purple, middle-sized. Lower scales of the involucre spinous; upper ones simple, acute.—C. glaber of Nuttall appears to be only a variety of this species.
- 5. C. virginianus Willd.: stem attenuated, mostly 1-flowered; leares sessile, lanceolate, margin revolute, distantly and spinosely serrate.

smooth above, tomentose beneath; involuere ovate; seales appressed, shortly mueronate, earinate.—Cnicus virginianus Pursh.—Cirsium virginianum Mich.

IIAB. Woods. Penn. to Car. July—Sept. 21.—Stem 2—3 feet high, covered with a white down, especially towards the

summit. Flowers solitary, terminal, purple.

6. C. discolor Nutt.: stem divaricately branched; leaves lanecolate, sessile or clasping, more or less deeply pinnatifid, smooth above, tomentose beneath; segments 2-lobed, ciliate and spinous; involucre subglobose; scales ovate, spinous.—Cnieus discolor Muhl.

HAB. Margins of swamps. N. J. to Car. July, Aug. 3.—
Stem 3—6 feet high, hairy and tomentose; branches leafy.

Leaves long. Flowers solitary, middle-sized, purple.

7. C. pumilus Nutt.: stem hairy, few-flowered; leaves clasping, green on both sides, oblong-lanceolate and pinnatifid; segments irregularly lobed, ciliate and spinous; involuere large, and somewhat globose, naked; seales appressed, lanceolate, acuminate, spinous.

- HAB. Dry fields. N. S. &.—Stem 1—2 feet high, erect or subdecumbent. Leaves large, the lowest often 12 inches long. Flowers few, very large, purple. Pappus more than an inch in length.—Nuttall describes a variety of this species with the stem simple, 1-flowered, and the leaves densely margined with spines. It occurs on the banks of the Hudson near the city of New-York, and is called var. hystrix.
- 8 C. spinosissimus Wult.: leaves sessile, pinnatifid, acutely incised, very spinous, woolly beneath; flowers crowded, braeteate; bracts very spinous, the spines generally in pairs; involuere unarmed.—Cnicus horridulus Pursh.
 - Hab. Fields. N. S. to Car. July—Sept. 21.—Stem 2—3 feet high, hollow. Flowers axillary and terminal, large, yellowishwhite, (pale purple Elliott.) Braets 20 or 30 round the base of each flower, on the outer ones spines in pairs. Scales of the involucre lanceolate, very acute, but scarcely spiny.
- 9. C. glutinosus Beck: leaves pinnatifid, with divaricate segments; involuere ovate, with unarmed glutinosus seales.—Cnicus glutinosus Big.
 - Hab. Damp soils. Mass. Aug., Sept. 3.—Stem 4—6 feet high, branching. Leaves sessile, somewhat clasping. Flowers small, on slender stalks, deep purple.—Allied to C. mutieus, but differs by its leaves and by the ovate glutinous scales of the involuere.

12. ONOPORDON. Linn.

Involucre ventricose, with the scales spreading and spinous. Receptacle pitted. Puppus deciduous, rough.

Syngenesia. Æqualis.

O. acanthium Linn.: leaves ovate-oblong, sinuate and spinous, decurrent, woolly on both sides; scales of the involucre subulate, spreading.

Hab. Waste grounds. N. S. July. 3.—Stem 4—6 feet high, branched and winged to the summit; wings very spinous. Involucre globose. Flowers large, solitary, purple. Introduced.

Cotton Thistle.

13. CENTAUREA. Lina.

Involucre scaly. Receptacle bristly. Corol of the ray infundibuliform, irregular, larger than those of the disk. Pappus simple. Syngenesia. Frustranea.

1. C. jacca Linn.: leaves linear-lanceolate, the lower ones broader and toothed; scales of the involucre scariose and torn, the lower ones pinnatifid.

HAB. Penn. Muhl. July, Aug. 21.—Scales of the involucre pale-brown and shining, the outer ones deeply pinnatifid, the inner or uppermost ones torn. Flowers purple. Introduced.

Brown Knapweed.

2. C. nigra Linn.: lower leaves angular-lyrate, upper ones ovate; scales of the involucre ovate, ciliated with capillary teeth.

Hab. Mass. and Penn. July, Aug. 21.—Stem 2—3 feet high. Leaves scabrous. Scales of the involucee almost black, the teeth brown. Flowers solitary, terminal, purple. Introduced.—Besides the above, C. cyanus, C. benedicticta and C. calcitrapa are naturalized in some parts of the United States. None of them are indigenous.
Black Knapweed.

14. ELEPHANTOPUS. Linn.

Partial involucre 4-flowered. Florets ligulate, 5-cleft, perfect. Receptacle naked. Pappus setaceous.

Syngenesia. Segregata.

E. carolinianus Willd.: stem branched, leafy, hairy; leaves of the root and stem oblong, tapering at base, hairy.

Hab. Dry soils. Md. to Car. Sept. 21.—Stem 2 feet high, villous, especially near the base, branching towards the summit. Heads of flowers composed of four clusters, each 4-flowered, with the involucre 9—10-leaved. Corol purple.

Elephant's-foot.

15. VERNONIA. Linn.

Involucre ovate, imbricate. Receptacle naked. Stigma bifid. Pappus double; outer short, chaffy; inner capillary. Syngenesia. Æqualis.

- 1. V. noveboracensis Willd.: leaves numerous, lanceolate, scabrous, serrulate; corymb fastigiate; scales of the involucre filiform at the summit.
 - HAB. Wet grounds. Can. to Car. W. to Miss. Aug., Sept. 24.—Stem 4—6 feet high, branching towards the top. Flowers in a very large terminal corymb, purple.
- 2. V. prealta Willd.: stem very tall, angular, densely pubescent; leaves numerous, lanceolate, acutely serrate, pubescent beneath; corymb fastigiate; scales of the involucre ovate, acute, unarmed.

HAB. Meadows. N. S. to Car. Aug.—Oct. 21.—A very tall rough looking plant. Flowers purple.

16. LIATRIS. Linn.

Involucre oblong, imbricate. Receptacle naked. Pappus feathered, generally coloured. Acines pubescent, obconic.

Syngenesia. Æqualis.

1. L. spicata Willd.: leaves linear, entire, smooth, ciliate at base, nerved and punctate; flowers in spikes; scales of the involucre linear, obtuse.—L. macrostachya Mich. Pursh.

HAB. Meadows. Penn. to Car. Aug., Sept. 21.—Stem 3—6 feet high. Flowers in a terminal spike, purple. Involuces 8—10-flowered.

2. L. pilosa Willd.: stem simple, pubescent; leaves linear, hairy, ciliate; flowers in loose racemose heads; scales of the involucre oblong, obtuse; pedicels bracteate.

Hab. Pine barrens. N. J. to Goor. Sept.—Nov. 21.—Stem 2—3 feet high, a little hairy. Leaves long and linear. Raceme long, leafy. Involucre with 10—14 flowers. Flowers small, bright purple.

3. L. scariosa Willd.: stem erect, hairy; leaves lanceolate, pubescent, scabrous on the margin; raceme long; involucre 14-flowered; seales obovate, nearly glabrous, with the margins scarious; the lower ones expanding.

HAR. Sandy woods. Penn. to Car. Aug.—Oct. 24.—Stem 3—4 feet high. Lower leaves very long. Flowers numerous, in a terminal raceme, bright purple. A very variable species. Sec. Ell. Sk. ii. 281.

4. L. squarrosa Willd.: stem simple, pubescent; leaves very long, linear, nerved, with the margins scabrous; racemes few-flowered, leafy; upper scales of the involucre lanceolate, rigid and spreading; segments of the florets linear, villous internally.

HAB. Sandy woods. Penn. to Flor. W. to Miss. Sept.—Oct. 21.—Stem 2—3 feet high. Flowers generally 4—5, in a terminal

raceme, bright purple. Involucre about 20-flowered.

17. BACCHARIS. Linn.

Involucre imbricate, its scales ovate and somewhat coria-

ceous. Receptacle naked. Florets tubular, dioecious. Sterile with the anthers exserted, unawned at base, pappus slightly feathered. Fertile filiform, pappus capillary.

Syngenesia. Superflua.

B. halimifolia Linn.: leaves obovate and oval, incisely toothed near the summit; panicle compound, leafy; heads of flowers peduncled.

HAB. Sea coast. Md. to Geor. Sept., Oct. 5.—A shrub 6—12 feet high, and with the leaves covered with a whitish powder or dust. Flowers in a large loose terminal panicle. Pappus of the fertile florets hairy, twice as long as the corel.

Ploughman's Spikenard.

18. CONYZA. Linn.

Involucre imbricate, the scales appressed. Receptacle naked. Marginal florets fertile, 3-cleft. Pappus simple, capillary. Acines hairy. Syngenesia. Superflua.

C. camphorata Pursh: herbaceous, slightly pubescent; leaves on petioles, ovate-lanceolate, very acute, denticulate; corymbs terminal and axillary, shorter than the leaves; scales of the involucre acute, as long as the florets.—Erigeron camphoratum Linn.

HAB. Salt marshes. Mass. to Geor. Aug., Sept. 21.—Stem 1—2 feet high, rather succulent. Flowers in axillary and terminal corymbs, purple.—When bruised, this plant gives out a strong spicy but somewhat disagreeable odour. Big. Marsh Fleabane.

19. INULA. Linn.

Involucre squarrose or imbricate. Florets of the ray very numerous, yellow. Anthers each with 2 bristles at the base. Receptacle naked. Pappus simple. Nutt.

Syngenesia. Superflua.

· I. helenium Linn.: leaves clasping, somewhat toothed, ovate, rugose and tomentose beneath; scales of the involucre downy.

HAB. Road sides. N.S. July, Aug. 21.—Stem 3—4 feet high. branching at the top. Leaves very large, those of the root petioled, of the stem clasping. Flowers large, solitary, terminal, yellow.

Elecampane.

20. CHRYSOPSIS. Nutt.

Involucre imbricate. Anthers naked at the base. Receptacle naked. Pappus double; the outer chaffy and minute; the inner hairy, scabrous and many rayed. Acines obovate, villous.—Rays of the corol mostly yellow.

Syngenesia. Superflua.

- 1. C. mariana Nutt.: hairy; leaves oblong, lanceolate, serrate; the upper ones sessile, acute; the lower ones spathulate and generally obtuse; coryinb simple; involucre viscidly pubescent.—Inula mariana Linn.
 - Hab. Sandy woods. N. J. to Car. Aug.—Oct. 24.—Stem 1—2 feet high, clothed with long hairs. Flowers in corymbs; florets of the ray 16—20.
- 2. C. falcata Beck: woolly and villous; leaves sessile, linear, very acute, subfalcate and spreading; nerves pilose on both sides; flowers in axillary corymbs; involucre pilose.—Inula falcata Pursh.
 - HAB. Pine woods. N. J. Sept., Oct. 21.—Stem 6—12 inches high. Flowers in crowded corymbs, small, bright yellow. Ray florets oblong, tridentate.—Mr. Nuttall supposes this species to be a mere variety of the preceding.
- 3. C. graminifolia Nutt.: silky; stem leafy towards the summit; leaves linear-lanceolate, acute, entire, nerved; corymb compound.—
 Inula graminifolia Mich.
 - HAB. Sandy woods. Del. to Flor. Aug.—Oct. 21.—Stem 1—2 feet high and with the leaves covered with a silky pubescence. Leaves long, linear. Corymb made up of many heads. Flowers yellow.—Closely allied to C. argentea of Elliott, but the leaves are conspicuously nerved, the corymbs generally more compact and the heads more numerous.—The three species above described, differ so much in habit from Inula helenium, as to warrant their separation; a suggestion first made by Mr. Nuttall, and subsequently adopted by Mr. Elliott. But it is doubtful whether the range of the genus is so extensive as we should be led to infer from the remarks of Mr. Nuttall.

21. ARNICA. Linn.

Involucre hemispherical, with the leafets equal and longer than the disk. Receptacle naked. Pappus simple. Florets of the ray often with 5 filaments destitute of anthers, (yellow.)

Syngenesia. Superflua.

- A. nudicaulis Nutt.: hirsute; radicle leaves opposite, decussate, broad-lanceolate, nerved and toothed; stem nearly leafless, divided near the summit into a few 1-flowered branches.—A. claytoni Pursh.—Doronicum nudicaule Mich.
 - HAB. Pine barrens. Penn. to Car. July, Aug. 21.—Stem 2—3 feet high, simple, hirsute, somewhat viscid. Leaves of the root large, spreading, strongly nerved. Flowers large, yellow. Leopard's-bane.

22. GNAPHALIUM. Linn.

Involuces imbricate, with the scales membraneous and often coloured. Receptacle naked. Florets of the ray subulate; some of the disk occasionally abortive. Pappus rough.

Syngenesia. Superflua.

* Flowers perfect.

1. G. polyecphalum Mich.: herbaceous, erect; leaves linear-lanceolate, acute, glabrous on the upper surface, pubescent beneath; stem paniculate, tomentose; corymbs terminal, clustered.

Hab. Fields. Can. to Car. W. to Miss. July—Sept. ©.—

Stem 1—2 feet high. Flowers in thick clusters forming a large terminal corymb, pale yellow. Fragrant Life Everlasting.

2. G. purpurcum Linn.: herbaceous; stem erect, simple; leaves linear-spathulate, tomentose beneath; flowers sessile, clustered, axillary and terminal.

HAB. Barren soil. N. Y. to Car. July—Oct. 21.—Stem erect and assurgent, 8—12 inches high. Flowers in compact axillary

and sessile clusters, purplish.

3. G. sylvaticum Linn.: stem herbaceous, very simple, nearly erect; leaves linear-lanceolate, downy on both sides; flowers axillary, forming a distant and leafy spike.

HAB. Woods. Can. and N. S. July, Aug. 21.—Stem a foot high. Flowers sessile in the axils of the leaves, forming a more or less interrupted spike. Scales of the involucre oblong, shining, with a broad brown border.

4. G. americanum Linn.: stem herbaceous, erect, branching; leaves obovate-spathulate, pubescent beneath; flowers axillary and terminal, in clustered spikes.

Hab. Rocky woods. Penn. and Virg. July-Sept. ©.—Stem 6-10 inches high. Flowers small, pale yellow.

5. G. nliginosum Linn.: stem herbaccous, branched, diffuse, woolly; leaves linear-lanceolate; flowers in terminal crowded clusters which are shorter than the leaves.

Hab. Wet grounds. Can. and N. S. Aug., Sept. . —Stem a span high, very much branched. Flowers small, 2—3 together, forming oblong clusters at the extremity of the branches. Scales of the involucre yellowish-brown, shining.

Marsh Cudweed.

6. G. germanicum Smith: stem herbaceous, erect, proliferous at the summit; leaves lanceolate, acute, downy; flowers capitate in the axils of the branches and terminal.

Hab. Fields and pastures. Penn. and Virg. July, Aug. @.—
Stem 6—8 inches high, with numerous leaves. Flowers in a globular head. Scales of the involucre yellowish, very acute.

Common Cudweed.

7. G. decurrens Ires: stem erect, much branched; leaves linear-lanceolate, very acute, decurrent, white and woolly beneath, naked above; flowers in dense terminal roundish clusters.

Hab. Hills. N. S. Aug. 21.—Stem 1 1-2-2 feet high. Flowers yellowish,

** Flowers dioccious. Antennaria. Brown.

8. G. margaritaceum Linn.: herbaceous; stem branching near the summit; leaves linear-lanceolate, tapering, acute; tomentose beneath; corymb fastigiate; flowers on pedicels.

Hab. Woods and mountains. Can. to Car. Aug., Sept. 21.—
Stem 1—2 feet high, clothed with a thick wool. Flowers large, in terminal corymbs. Involucre white. Florets yellow.

Life Everlasting.

9. G. plantagineum Linn.: shoots procumbent; stem simple; radical leaves ovate, nerved; corymb clustered; flowers dioecious; inner scales of the involucre long, obtuse, coloured.—G. dioicum var. plantagineum Mich.

Hab. Woods. Can. to Car. W. to Miss. May, June. 2f.—
Stem 8-10 inches high, downy. Radical leaves large and broad,
those of the stem lanceolate. Flowers in a small terminal corymb, reddish-white; fertile ones cylindrical and slender.

SUBORDER III. ASTEREÆ.

23. ERIGERON. Linn.

Involucre imbricate. Receptacle naked. Florets of the ray numerous, very narrow, (mostly of a different colour from the disk.) Pappus double; the outer very small; the inner hairy, of a few rays.

Syngenesia. Superflua.

- 1. E. bellidifolium Linn.: hirsute-hoary; radical leaves obovate, slightly serrate; those of the stem sessile, scattered, oblong-lanceolate; stem.3—5-flowered; rays twice as long as the involucre.—E. pulchellum Mich.
 - Hab. Shady woods. Can. to Car. W. to Miss. June—Aug. 21.—Stem 12—18 inches high. Flowers few, large, pale purple. Robin's Plantain.
- 2. E. integrifolium Big.: stem simple, leafy, smooth; leaves lanceolate, entire, 3-nerved; flowers corymbed; involucre hemispheric, with acute scales.
 - HAB. Woods and road sides. N. S. June—Aug. 21.—Stem 2 feet high, simple. Leaves slightly clasping, lower ones sometimes toothed. Flowers white, on rough leafy peduncles.
- 3. E. philadelphicum Linn.: pubescent; lower leaves cuneate, oblong, sometimes incisely toothed; stem leaves oblong-lanceolate, clasping; flowers somewhat corymbose; florets of the ray capillary, twice as long as the involucre.
 - HAB. Fields and woods. Can. to Car. W. to Miss. Aug., Sept. 24.—Stem 2-3 feet high, slender. Flowers in a loose corymb, pale purple; ray florets very numerous.
- 4. E. purpurcum Linn.: pubescent; leaves oblong, toothed, clasping; upper ones very entire; peduncles corymbed, thick, the lower

ones elongated; scales of the involucre pilose; rays twice as long as the calyx.

Hab. Woods and pastures. Can. to Virg. N. to Arc. Amer. July, Aug. 21.—Stem 12—18 inches high. Flowers large,

purple.

5. E. strigosum Linn.: strigose and hairy; leaves lanceolate, attenuate at each end, entire or with a few coarse teeth in the middle; flowers in a corymbose panicle.—E. strigosum and E. nervosum Pursh.?

Hab. Fields and meadows. Can. to Car. W. to Miss. July, Aug. O.—Stem 2—3 feet high. Flowers white, with the rays capillary.

oupling

6. E. heterophyllum Linn: radical leaves roundish-ovate, deeply toothed, petiolate; those of the stem lanceolate, acute, serrate in the middle; torymb terminal.

HAB. Waste grounds. N. S. June-Aug. O. Stem 2-3

feet high. Flowers white.

Subgenus Ceanotus. Nutt. Pappus simple.

7. E. canadense Linn.: stem hispid, paniculate, often profusely branched; leaves lanceolate-linear; florets of the ray numerous, crowded, very short.—E. canadense and E. pusillum Nutt.

HAB. Dry fields. Can. to Flor. W. to Miss. July—Sept. @. Stem 6 inches to 6 feet high. When small, constituting E. pusil-

lum of Nuttall.

24. ASTER. Linn.

Involucre imbricate, with the lower scales often spreading. Florets of the ray generally more than 10, (not yellow.) Receptacle naked. Pappus simple, hairy.

Syngenesia, Superflua.

- OBS. Mr. Elliott's admirable Sketch of the Botany of South Carolina and Georgia, contains detailed descriptions of many of our Northern Asters, and may be consulted with much advantage. The whole genus is liable to great variations; and it is more than probable that many of the species here enumerated, will be found, on more minute investigation, to be mere varieties.
- * Florets of the ray 5, white. Scales of the involucre white, with the summits green.
- 1. A. solidaginoides Mich: leaves linear-lanceolate, entire, scabrous on the margin; branches corymbose-fastigiate; flowers sessile, aggregate; scales of the involucre oblong-obtuse, appressed, somewhat reflexed at the summit.—Conyza linifolia Linn.

HAB. Dry swamps and woods. Penn. to Car. Aug.—Oct. 24.
—Stem 2 feet high, smooth. Leaves almost linear, obscurely 3-nerved. Flowers in small clusters, forming a fastigiate corymb.

- 2. A. conyzoides Willd.: stem simple, smooth and rigid; leaves ovallanceolate, acute, serrate towards the summit, 3-nerved; the lower ones attenuate at base; the upper entire; scales of the involucre oval, obtuse, appressed, slightly reflexed at the summit.—A. marylandicus Mich.
 - HAB. Woods and copses. Penn. to Geor. July, Aug. 21.— Stem 1—2 feet high. Var. plantiginifolius of Nuttall, differs only in being smaller and in having its leaves cuneate-ovate.
 - ** Florets of the ray numerous. Pappus simple.

 † Leaves entire.
- 3. A. hyssopifolius Linn.: leaves linear-lanceolate, 3-nerved, dotted, acute, with the margin scabrous; branches fastigiate, clustered; florets of the ray about 5; scales of the involucre about half as long as the disk.
 - HAB. Sandy fields. N. J. to Car. Aug.—Oct. 24.—Stem 1—2
 feet high, smooth. Flowers in small terminal fastigiate corymbs.
 Florets of the ray 3—7 or more, white or purplish.
- 4. A. subulatus Mich.: very smooth; leaves linear-subulate, acute, erect; branches many-flowered; involucre cylindrical, the scales subulate; florets of the ray minute.
 - Hab. Salt marshes. Penn. to Car. Aug.—Nov. 21.—Stem erect, 2—3 feet high, smooth, with numerous spreading branches. Flowers very small, in a loose terminal panicle, pale purple.
- 5. A. foliolosus Ait.: stem bearing many branches, erect; leaves linear-lanceolate, attenuate at each end, acuminate, margin scabrous; those of the branches minute and numerous; branches few-flowered; scales of the involucre linear-acute, appressed.—A. cordifolius Mich.

Hab. Fields and road sides. Can. to Car. Aug.—Oct. 24.—
Stem 2—3 feet high, with spreading branches. Flowers in a compound panicle, white or pale purple.

6. A. tenuifolius Linn.: stem smooth, erect, with 1-flowered branches: leaves linear-lanceolate, tapering at each end, very entire, slightly scabrous along the margin; scales of the involucre acute, loose.

- HAB. Fields and road sides. Can. to Car. Aug.—Nov. 21.—
 Stem 2—3 feet high, with numerous leaves. Flowers numerous, in racemes along the main branches, pale purple.—It sometimes has the branches paniculate, and at others the leaves are quite linear, constituting in the former case A. dumosus Linn., in the latter A. ericoides Linn.
- 7. A. nemoralis Ait.: leaves linear-lanceolate, attenuate at base, with the margin scabrous and revolute; branches filiform, naked, 1-flowered; involucre loosely imbricated, with the scales acute and much shorter than the disk; rays numerous.—A. ledifolius Pursh.
 - HAB. Sphagnous swamps. Can. and N. J. Sept., Oct. 21.— Stem simple, 12—18 inches high, fragile and thickly set with leaves which are sometimes minutely bidentate. Flowers large, pale violet.—The stem is sometimes simple and 1-flowered.—A. uniflorus Mich.

16

8. A paludosus Ait.: stem simple; leaves sessile or clasping, subulate, smooth, with the margin scabrous; peduncles few, 1-flowered, axillary and terminal, leafy, pubescent; involucre large and squarrose.

—A. grandiflorus Walt.?

Hab. Borders of swamps. N. J. to Flor. Aug. - Nov. 21. -Stem 1-2 feet high, smooth nearly to the top, 3-5-flowered.

Flowers very large and beautiful, the rays bright blue.

9. A. multiflorus Ait.: stem diffusely branched, pubescent; leaves linear, entire, nearly smooth, slightly ciliate; involucre and peduncles squarrose, the scales oblong and ciliate.—A. multiflorus and A. ciliatus Willd.

- HAB. Fields and road sides. Can. to Car. Aug. 24.—Stem 2—3 feet high, branching, very pubescent. Flowers in crowded terminal racemes, on horizontal branches. Ray florets nearly white, disk ones yellowish.
- 10. A. sparsiflorus Mich.: very smooth; stem slender, much branched; leaves linear-subulate, somewhat fleshy and reflexed; branches spreading, leafy, 1-flowered; scales of the involucre acute, appressed.

Hab. Salt marshes. N. Y. to Car. Sept.—Nov. 21.—Stem 1—2 feet high. Flowers large; rays pale purple; disk yellow.

11. A. concolor Linn.: stem simple, erect, pubescent; leaves oblong-lanceolate, entire, hoary and pubescent on both sides; raceme terminal; scales of the involucre lanceolate, silky, appressed.

Hab. Pine woods. N. J. to Flor. Aug. - Nov. 21. - Stem 2-3 feet high, sparingly branched. Flowers in a long terminal ra-

ceme, blue. Root often tuberous.

12. A. salicifolius Pursh: stem smooth, paniculate at the summit; leaves linear-lanceolate, nearly entire, smooth; involucre lax, with the scales acute and spreading at their summits.—A. prealtus Lam.

Hab. Low grounds. N. S. Aug.—Oct. 24.—Stem 4—6 feet high. Flowers middle-sized, reddish-blue.

- 13. A. astivus Ait.: stem branching from the base, erect, hispid: branches hairy; leaves lanceolate, subclasping, attenuate at the apex, with the margin scabrous; scales of the involucre loose, linear, acute, equal.
 - Hab. Dry swamps. N. S. July—Sept. 21.—Stem 2 feet high-Flowers middle-sized; rays blue.
- 14. A. novæ argliæ Linn.: stem erect, hairy, paniculate; leaves narrow-lanceolate, hairy, clasping, auriculate, crowded on the branchlets; scales of the involucre lanceolate, loose, rather longer than the disk.
 - Hab. Meadows. Can. to Car. Sept.—Nov. 21.—Stem 3-6 feet high, almost hispid, with spreading branches. Flowers large, in a loose terminal panicle, blue or purple.—A very ornamental species.
- 15. A. cyancus Pursh: stem very smooth, branching, the branches spreading; leaves linear-lanceolate, clasping, smooth; flowers in pani-

culate racemes; scales of the involucre loose, lanceolate, as long as the disk.—A. norw angliw var. b. Ait.

- Has. Old meadows. N. Y. to Car. Sept.—Nov. 21.—Stem 3—4 feet high, smooth or slightly pubescent on the young branches. Flowers large, blue and purple.—Said by Pursh to be the handsomest of the genus.
- 16. A. phlogifolius Willd.: stem very simple, pubescent; leaves lanceolate, cordate, clasping, pubescent beneath, scabrous on the margin; paniele terminal, loose, few-flowered; scales of the involucre loose, imbricate, lanceolate.—A. amplexicaulis Mich.

HAB. Moist grounds. N. J. to Virg. Aug.—Nov. 24.—Stem 1—2 feet high. Flowers middle-sized, violet.

17. A. patens A't.: stem branching, hairy; leaves oblong-lanceolate, ciliate, cordate, clasping, scabrous and hairy on both sides; branches spreading, elongated, few-flowered, with minute leaves; scales of the involucre imbricate, lanceolate, spreading.—A. diversifolius Mich.

HAB. Hedges. N. S. Sept.—Nov. 21.—Stem 1—2 feet high. Flowers middle-sized; rays blue or purple; disk yellow.

†† Leaves lanceolate and ovate; the lower serrate.

1. Flowers in corymbs.

13. A. nudiflorus Nutt.: stem simple and smooth; leaves sessile, ovate-lanccolate, subacuminate, sharply serrate, upper surface scabrous; corymb simple, few-flowered; peduncles pubescent, naked, mostly I-flowered; involucre hemispherical, closely imbricated; scales linear-oblong and ciliate.

HAR. Swamps. N. J. rare. 21.—Stem 2—3 feet high.

Leaves 3 inches long, 1 inch wide. Flowers on peduncles 3—4 inches long, large, pale purple.

menes long, large, pare purple.

19. A. radula Ait.: stem erect, simple, angular; leaves lanceolate, serrate, acuminate, rugose and very scabrous; corymb terminal; involucre imbricate; scales lanceolate, somewhat obtuse, subsquarrose.

HAR. Nova Scotia and high mountains in N. S. Sept.—Nov. 21.—Flowers middle-sized; rays short, white.

- 20. A. strictus Pursh: leaves sessile, narrow-lanceolate, serrate, scabrous; stem one or few-flowered above; scales of the involucre imbricate, appressed, oblong, acute, scarcely shorter than the disk.—A. biflorus Mich.
 - Hab. High mountains. N. S. N. to Labrador. Sept., Oct. 21.—Stem 4—6 inches high. Flowers middle-sized; rays pale violet; disk brownish-yellow.
- 21. A. surculosus Mich.: stem simple, low and slender, minutely pubescent; lower leaves linear-lanceolate, entire or subserrate, scabrous above; upper ones linear, clasping; corymb 3—5-flowered, somewhat naked; involucre imbricate, subsquarrose; scales ciliate, linear-obloug, inner ones obtuse; rays about 20.
 - HAB. Woods. N. S. Torr. S. to Car. Sept. Oct. 21.—Root creeping. Stem 12—18 inches high. Flowers rather large, violet

purple; inner scales of the involucre often coloured .- The habit of this species is very much like that of a corymbose Liatris, and Mr. Nuttall thinks it is the A. elegans of Willdenow.

22. A. spectabilis Ait.: leaves oblong-lanceolate, somewhat scabrous and clasping; lower ones serrate in the middle; branches corymbose; involucre hemispherical, somewhat glandularly pubescent, foliaceous and squarrose; scales ciliate, cuneate-ovate and partly acute.

b. bellidifolius Nutt.: leaves oblong-obovate, serrate; corymb nearly simple, with the branchlets mostly 1-flowered. — A. bellidiflorus

- Hab. Swamps. N. J. to Virg. Aug.—Nov. 21.—Stem 2 feet high; branches 2 or 3-flowered, somewhat hairy. Flowers 10—15 in a corymb, large and blue. Var. b. has the stem never hairy above.
- 23. A. serotinus Willd.: leaves oblong-lanceolate, acuminate, sessile, smooth, scabrous on the margin; lower ones serrate; branches corymbose, smooth; branchlets 1-flowered; scales of the involucre lanceolate, acuminate, spreading.

Hab. Low grounds. N. Y. to Virg. Sept.—Nov. 21.—Stem 3 feet high. Flowers large, blue.

- 24. A. puniceus Linn.: stem hispid; leaves clasping, lanceolate, serrate, somewhat scabrous; branches paniculate; involucre loose, exceeding the disk; scales linear-lanceolate, nearly equal.
 - Hab. Salt swamps. Can. to Car. Sept.—Nov. 21.—Stem 6—8 feet high, purplish. Flowers large, purple or blue.
- 25. A. novi belgii Linn.: stem terete, smooth; leaves subclasping. lanceolate, smooth, scabrous on the margin; lower ones somewhat serrate; branches subdivided; involucre loosely imbricated; scales linearlanceolate. - A. novi belgii and A. floribundus Willd.

HAB. Fields. N. S. Aug. - Oct. 4. - Stem 3 feet high. Flowers middle-sized, pale purple.

- 26. A. acuminatus Mich.: stem simple, flexuous, angular; leaves broad-lanceolate, tapering and entire towards the base, unequally serrate near the summit, conspicuously acuminate; panicle corymbose, divaricate, dichotomous; scales of the involucre loose, linear. shorter than the disk.
 - HAB. Can. and mountains in N. S. Aug.-Oct. 21.-Stem a foot or more high. Leaves large. Flowers middle-sized; rays white.
- 27. A. dracunculoides Willd.: stem nearly smooth; leaves linear, acuminate, very entire; lower ones linear-lanceolate, subserrate; branches corymbose; involucre imbricate.
 - HAB. Low grounds. N. J. to Car. Sept.—Nov. 21.—Stem 4 feet high. Flowers small; rays white.

2. Flowers in panicles.

23. A. amplexicaulis Willd.: stem smooth, paniculate; leaves ovate-

oblong, acute, clasping, cordate, serrate, smooth; scales of the involucre lanceolate, closely imbricate.—A. pennsylvanicus Lam.

HAB. Woods. N. IJ. to Car. Sept.—Nov. 21.—Stem 2—3 feet high. Lower leaves attenuate and clasping, the upper ones more cordate. Flowers in a terminal panicle, middle-sized, blue.

- 29. A. prenanthoides Willd.: branches hairy; leaves clasping, spathulate-lanceolate, acuminate, serrate in the middle, cordate at base; scales of the involucre lanceolate, squarrose.
 - HAB. Penn. Muhl. Aug.-Oct. 21.-Flowers blue.
- 30. A. lævigatus Willd.: stem much branched, smooth; branches many-flowered; leaves subclasping, broad-lanceolate, subserrate, smooth; scales of the involucre lanceolate, loose, as long as the disk.
 - HAB. Wet woods. N. Y. to Car. Sept., Oct. 21.—Stem 2—4 feet high, profusely branched. Upper leaves narrow and nearly entire. Flowers numerous, pale purple; disk yellow.
- 31. A. versicolor Willd.: stem much branched, smooth; leaves subclasping, broad-lanceolate, smooth, somewhat serrate; radicle ones serrate in the middle; scales of the involucre lanceolate, loose, shorter than the disk.
 - Hab. Fields and Woods. N. J. to Car. Aug.—Oct. 21.—
 Stem 2 feet high. Flowers large and very numerous, clustered towards the summits of the branches; disk yellow; rays white, changing to a deep violet. Pursh.
- 32. A. mutabilis Linn.: stem smooth; branches virgate; upper leaves somewhat clasping, lanceolate, acuminate, very entire; lower ones lanceolate, narrow at basc, serrate; scales of the involucre loose, shorter than the disk.
 - HAB. Fields and woods. Penn. to Virg. Aug.—Oct. 21.—
 Flowers middle-sized; disk yellow; rays deep purple, changing to purple. Pursh.
- 33. A. lævis Linn.: stem smooth, angular; branches simple, 1-flowered; leaves somewhat clasping, remote, oblong, very entire, shining; radical ones subserrate; scales of the involucre imbricate, subcuneiform, acute, thickened at the apex.
 - HAB. Woods and sides of ponds. N. Y. to Virg. Sept.—Nov. 21.—Stem 2 feet high. Flowers large, bluish-purple.
- 34. A. concinnus Willd.: stem simple, paniculate at the summit; leaves lanceolate, somewhat clasping; lower ones smooth, subserrate; involucre closely imbricate.
 - Hab. Woods. N. Y. and Penn. Sept.-Nov. 21.—Stem 2 feet high. Flowers bluish-purple. Leaves, said by Pursh, to resemble those of Phlox maculata.
- 35. A. tardiflorus Linn.: branches divaricate; leaves sessile, serrate, smooth, spathulate-lanceolate, attenuate at base, margin reflexed; involucre loose; scales linear-lanceolate, nearly equal, smooth.
 - HAB. Low ground. N. S. Sept.—Nov. 21. rare.—Flowers middle-sized; rays pale blue.

- 36. A. tradescanti Linn.: stem terete, smooth; branches virgate; leaves lanceolate, serrate, sessile, smooth; involucre imbricate
 - HAB. Dry swamps. Can. to Virg. Aug.-Oct. 24.—Stem 3—4 feet high. Flowers very small; rays white or purple.—A. recurvatus of Willdenow, is considered by Dr. Torrey as a mere variety of the above. It has the leaves narrower and the panicle sometimes recurved.
- 37. A. eminens Willd.: stem paniculate; branchlets 1-flowered; leaves linear-lanceolate, acuminate, scabrous on the margin; lower ones subserrate; involucre imbricate; scales lanceolate—and A. laxus. Willd.
 - Hab. Fields. N. J. to Virg. Sept.—Nov. 21.—Flowers middlesized; rays pale, lilac; disk yellow, changing to red.—As suggested by Mr. Nuttall, A. laxus of Willdenow is scarcely to be distinguished from this species.
- 38. A. simplex Willd.: stem very smooth, paniculate at the summit; leaves lanceolate, acuminate, scabrous on the margin; those of the stem serrate at the apex, of the branches very entire; involucre loosely imbricate; scales linear-subulate.
 - HAB. Penn. Torr. 24.-Rays white; disk yellow. Pursh.
- 39. A. polyphyllus Willd.: stem much branched, pubescent; leaves linear, very entire; radical ones oblong, subserrate; involucre loosely imbricate.
 - HAB. Penn. Torr. 21.—Rays white; disk yellow, changing to red or brown. Pursh.
- 40. A. junceus Ait.: stem paniculate, smooth; branches virgate; leaves lanceolate-linear, sessile, smooth; lower ones subserrate; those of the branches lanceolate; involucre imbricate.
 - Hab. Low grounds. N. S. Aug.—Oct. 21.—Stem 4—6 feet high. Flowers flesh coloured.—A lanceolatus of Willdenow, is only a variety with a branched stem and smaller flowers.
- 41. A. fragilis Willd.: stem smoothish; branches corymbose-paniculate; leaves linear, acuminate, very entire; radical ones oblong, serrate; involucre imbricate; scales appressed.
 - Hab. Fields. N. S. Sept. 24.—Stem 2 feet high. Flowers small, white.
- 42. A. miser Linn.: stem villous; leaves sessile, lanceolate, serrate, smooth; involucre imbricate; scales acute; disk equal to the ray.
 - a. divergens; leaves elliptical-lanceolate .- A. divergens Ait.
 - b. diffusus; leaves all proportioned .- A. diffusus Ait.
 - c. pendulus; leaves of branches rather remote.—A. pendulus Ait. Hab. Fields. N. S. Aug.—Nov. 21.—Flowers small, white.
 - -I follow Dr. Torrey in uniting the above species with A. miser.

3. Leaves cordate and ovate, serrate.

43. A. undulatus Linn.: stem paniculate, hispid; branchlets secund, leafy, 1-flowered; leaves_oblong, cordate, clasping, very entire, hairy,

subundulate; lower ones cordate, ovate, subserrate, petiolate; petioles winged.—A. diversifolius Mich.

- HAB. Old fields. N. Y. to Car. Sept. 4.—Stem 2—3 feet high. Flowers large, in a terminal spike; ray pale blue; disk yellow.—According to Mr. Elliott A. patens of Willdenow and A. amplexicaulis of Michaux are identical with this species.
- 44. A. sagittifolius Willd.: stem smooth, branched; leaves oblong-lanceolate, acuminate, sessile, serrate in the middle; radical ones oblong, cordate-saggitate, serrate, petiolate; scales of the involuere loosely imbricate, lanceolate.

HAB. Rocky woods. N. S. Torr. S. to Car. Sept. 21.— Stem 2-3 feet high, erect, with many branches. Flowers mid-

dle-sized, blue.

- 45. A. paniculatus Ait.: stem much branched, smooth; branchlets hairy; leaves ovate, lanceolate, subserrate, smooth, petiolate; radical ones ovate-cordate, serrate, seabrous, petiolate; petioles naked; involuere loose, somewhat imbricate.
 - HAB. Woods. Can. to Car. Aug.—Oct. 21.—Stem 2—4 feet high. Flowers rather small, but numerous; rays changing from white to blue; disk from yellow to purple or brown.—Seareely different from A. undulatus.
- 46. A. cordifolius Linn.: stem paniculate, nearly smooth; leaves cordate, hairy beneath, coarsely serrate, petiolate; petioles winged; panicle divarieate; involucre loose, slightly imbricate—and A. heterophyllus Willd.
 - HAB. Mountainous woods. Can. to Flor. Sept.—Nov. 21.—
 Stem 2-3 feet high, branched, with the branches pubescent.
 Flowers small, in panieles composed of crowded racemes, white or pale purple.
- 47. A. corymbosus Ait.: stem smooth; branches hairy; leaves ovate, sharply serrate, acuminate, nearly smooth; lower ones cordate, petiolate; petioles naked; corymb fastigiate; involucre oblong, imbricate; scales obtuse, closely appressed.

HAB. Dry woods. N. Y. to Car. July, Aug. 21.—Stem 2 feet high. Flowers larger than in the preceding, in a fastigiate corymb, white tinged with purple.

48. A. macrophyllus Linn.: stem branched, diffuse; leaves ovate, petiolate, serrate, scabrous; upper ones cordate-ovate, sessile; lower ones cordate, petiolate; petioles somewhat margined; involuere eylindrical, closely imbricate; scales oblong, acute.

HAB. Rocky woods. Can. to Geor. Sept., Oct. 24.—Stem 1—2 feet high. Flowers above middle-size; rays white or blue.

- *** Pappus double. Flowers generally in corymbs.
- 49. A. linariifolius Linn.: stem somewhat decumbent; branches fastigiate, 1-flowered; leaves numerous, linear, mucronate, without nerves or punctures, carinate, scabrous, rigid; those of the branches recurved; involuere imbricate, as long as the disk—and A. rigidus Willd. Pursh.—Chrysopsis linariifolia Nutt.

- HAE. Gravelly and rocky places. N. Y. to Car. Sept., Oct. 21.—Stem 1—2 feet high, pubescent when young scabrous on the margins. Branches 1-flowered, forming an umbellate corymb. Flowers middle-sized; rays pale violet; disk yellow.
- 50. A. linifolius Linn.: stem corymbosely branched, scabrous; branches leafy; leaves linear, without nerves, punctate, scabrous, reflexed-spreading; involucre imbricate, short; rays nearly equal to the disk,—Chrysopsis linifolia Nutt.

Hab. Shady woods. N. S. Sept., Oct. 21.—Stem 1 1-2-2 feet high. Flowers large, white or pale purple.—Scarcely dis-

tinct from the preceding.?

51. A. humilis Willd.: leaves somewhat rhomboidal, oval-lanceolate, acuminate at each end, slightly petiolate, smooth, hispid on the margin; corymb diverging, dichotomous, rather naked, few-flowered; involucre loose, imbricate; florets of the ray 8—and A. cornifolius Willd.—A. infirmus Mich.—Chrysopsis humilis Nutt.

HAB. Rocky situations. Can. to Car. Aug., Sept. 21.—Stem 1—2 feet high, pubescent. Flowers in small terminal corymbs, white and large in proportion to the plant; ray florets about 8.

52. A. amydalinus Lam.: stem simple, corymbose-fastigiate at the summit; leaves lanceolate, attenuate at base, acuminate, scabrous on the margin; involucre loose, imbricate; scales lanceolate, obtuse.—A. umbellatus Ait.—Chrysopsis amygdalina Nutt.

Hab. Low grounds. N. S. Aug., Sept. 24.—Stem 2 feet high. Flowers numerous; ray florets about 12, narrow, white.—Closely

allied to the former.

25. SOLIDAGO. Linn.

Involucre imbricate, with the scales appressed. Florets of the ray about 5. Receptacle naked, punctate. Pappus simple, hairy.—Flowers yellow. Syngenesia. Superflua.

Obs. An excellent monograph of this difficult genus by Sir J. E. Smith, will be found in Rees' Cyclopædia, art. Solidago. The remarks made concerning the variable character of the preceding genus will equally apply to this.

- * Racemes secund. Leaves with 3 combined nerves.
- 1. S. canadensis Linn.: stem villous; leaves lanceolate, serrate, 3-nerved, scabrous; racemes paniculate, secund, recurved; rays short.
 - HAB. Fields. Can. to Car. Aug., Sept. 24.—Stem 2—5 feet high, very villous. Leaves large, always scabrous on the upper surface. Flowers in secund racemes, on large branches, recurved at the summit.

 Golden Rod.
- 2. S. procera Ait.: stem erect, villous; leaves lanceolate, serrate, 3-nerved, scabrous, villous beneath; racemes erect, spiciform, before flowering nodding; rays short.

- HAB. Swamps and low grounds. Can. to Geor. N. to Subarc. Amer. July—Sept. 21.—Stem 4—7 feet high. Flowers in a pyramidal panicle which is recurved before flowering.
- 3. S. serotina Ait.: stem erect, terete, smooth; leaves linear-lanceolate, serrate, smooth, 3-nerved; racemes paniculate, secund; peduncles pubescent.

HAB. Woods. N. S. Sept., Oct. 24.—Stem 4 feet high. Leaves ciliate on the margin when young.

- 4. S. gigantea Ait.: stem erect, smooth; leaves lanceolate, serrate, scabrous on the margin, obscurely 3-nerved; racemes paniculate, secund; peduncles hirsute; rays short.
 - Hab. Low grounds. N. S. Aug., Sept. 21.—Stem 4—7 feet high, purplish.
- 5. S. ciliaris Willd.: stem erect, smooth; leaves lanceolate, sub-3-nerved, smooth, scabrous on the margin, subserrate; raceme paniculate, secund; peduncles smooth; bracts ciliate; rays short.

HAB. Woods. Penn. Aug. 21.—Stem 3 feet high, angular. Radical leaves oval, petioled.

6. S. reflexa Ait.: stem erect, villous; leaves lanceolate, subserrate, 3-nerved, scabrous, reflexed; branches paniculate, subsecund, reflexed.

Hab. Pine woods. N. J. to Car. Aug., Sept. 21.—Leaves narrow-lanceolate, with a few serratures in the middle. Racemes short.

7. S. lateriflora Linn.: stem erect, somewhat hairy; Ieaves Ianceolate, sub-3-nerved, smooth, scabrous on the margin; the lower ones slightly serrate; racemes paniculate, somewhat recurved, secund.

HAB. Dry woods. Can. to Car. Aug.—Oct. 21.—Stem 2—3 feet high; the lower part sometimes with lateral flowering branches. Flowers larger and leaves broader than in any of the preceding species.

** Racemes secund. Leaves veined.

8. S. aspera Ait.: stem erect, terete, hairy; leaves ovate, somewhat elliptic, very scabrous, rugose, serrate, without nerves; racemes paniculate, secund.

HAB. Fields and woods. N. Y. to Car. Sept. 24.—Stem 3—5 feet high, very hairy and somewhat scabrous. Flowers in a long terminal panicle composed of secund racemes.

9. S. altissima Linn.: stem erect, hispid; leaves lanceolate, the lower ones deeply serrate, very scabrous, rugose; panicle secund and often spreading—and A. rugosa Willd.

HAB. Fields and woods. Can. to Car. Aug., Sept. 21.—Stem 3—7 feet high, robust and hairy, much branched at the summit. Leaves sessile, lanceolate, acute, rugose and scabrous. Flowers in large and almost corymbose panicles composed of small, nearly erect recurved branches.—A very variable species.

10. S. scabra Willd.: stem erect, hairy, sulcate; leaves oblong, at.

tenuate at both ends, acuminate, glabrous above, rugose and scabrous beneath, with appressed serratures in the middle; racemes secund.

HAB. Old fields. Penn. to Virg. Aug.—Oct. 24.—Stem 2-5 feet high.

11. S. memoralis Ait.: stem erect, tomentose; radical leaves somewhat cuneate, serrate; cauline ones lanceolate, hispid, very entire; racemes paniculate, secund.

HAB. Sandy fields. Can. to Car. Aug.—Oct. 24.—Stem 1—2 feet high. Flowers in a small and somewhat corymbose panicle.

—The whole plant has a greyish or pulverulent appearance.

12. S. patula Willd.: stem erect, smooth; leaves elliptic, serrate, smooth; radical ones oblong-spathulate; racemes paniculate, secund, spreading; peduncles pubescent.

HAB. Shady woods. N. S. Sept., Oct. 21.—Stem 2 feet high, virgate and striate. Racemes short, with the flowers rather

ıarge.

13. S. ulmifolia Willd.: stem erect, smooth, striate; leaves elliptic, deeply serrate, acuminate, villons beneath; radicle ones obovate; racemes paniculate, secund; peduncles villous; rays short.

Hab. Shady woods. N. S. Aug. - Oct. 21. - Stem 3-4 feet high. Flowers in an oblong terminal panicle composed of secund

and recurved racemes.

14. S. arguta Ait.: stem erect, smooth; leaves smooth, acutely and unequally serrate; radical ones spathulate-ovate; cauline elliptic; racemes paniculate, secund; florets of the ray long.

Hab. Woods and meadows. Can. to Car. Sept.—Nov. 24.—
Stem 2—3 feet high, smooth or a little pubescent. Flowers on

recurved racemes forming long terminal panicles.

15. S. juncea Ait.: stem erect, smooth; leaves lanceolate, smooth, scabrous on the margin; lower ones serrate; racemes paniculate, secund.

Hab. Sandy fields. N. J. to Car. Aug.—Oct. 21.—Stem 3 feet high, slender; branches when young pubescent. Leaves long, lanceolate. Racemes secund, forming a scattered terminal panicle.

16. S. elliptica Ait.: stem erect, smooth; leaves elliptic, smooth, serrate; racenies paniculate, secund; rays middle-sized.

Hab. Shady woods. N. Y. to Car.? Aug.—Oct. 24.—Stem 2—3 feet high. Leaves large.

17. S. recurrata Willd.: stem erect, pubescent; leaves lanceolate, serrate, scabrous on the margin; racemes elongated, secund, recurved, paniculate.

HAB. Shady woods. Penn. and Virg. Sept.—Nov. 21.—Pursh.

18. S. sempervirens Linn.: stem erect, smooth; leaves linear-lanceolate, somewhat fleshy, smooth, very entire, scabrous on the margin; racemes paniculate, secund; peduncles hairy.

- Hab. Swamps. Can. and N. S. Sept.—Nov. 21.—Stem 2—3 feet high.
- 19. S. odora Ait.: stem erect, pubescent; leaves linear-lanceolate, entire, smooth, scabrous on the margin; racemes paniculate.
 - Hab. Fertile woods. Can. to Car. Aug.—Oct. 21.—Stem 3 feet high, pubescent near the summit. Racemes recurved, forming a pyramidal panicle.—The flowers when dried, form an excellent substituc for tea, and have been exported to China. Pursh. The leaves yield by distillation, a fragrant volatile oil. Big. Med. Bot. i. 187. Golden Rod.

*** Racemes erect.

- 20. S. speciosa Nutt.: stem smooth, simple or virgately branched; leaves lanceolate, entire, somewhat fleshy, seabrous on the margin; the lower very broad; radical ones subserrate; racemes terminal, ereet and compound, pubescent; peduncles mostly shorter than the involucre; rays elongated.—S. sempervirens Mich.
 - HAB. Shady woods. N. J. to Car. Sept., Oct. 2f.—Stem often 6 feet high, smooth and sulcate. Leaves large. Racemes numerous, terminal and erect; rays very broad.
- 21. S. bicolor Linn,: stem and leaves hairy; leaves elliptic, the lower ones serrate; branches leafy; racemes erect; scales of the involucre obtuse.—Aster bicolor Nees and Sprengel.
 - HAB. Dry hills. Can. to Car. Aug.—Oct. 21.—Stem 1—2 feet high, erect, very pubescent. Leaves covered with a whitish pubescence. Flowers numerous, rather large, in short clusters, forming a compact raceme along the upper part of the stem; rays nearly white.
- 22. S. petiolaris Ait.: stem erect, villous; leaves elliptic, somewhat scabrous, petiolate; racemes erect; rays elongated.
 - IIAB. Sandy woods. N. J. to Car. Sept., Oct. 21.—Stem 2—3 feet high, very villous. Leaves large, the upper ones nearly sessile, the lower tapering into a petiole. Racenes numerous, short.
- 23. S. stricta Ait.: stem ereet, smooth; cauline leaves lanceolate, very entire, smooth, scabrous on the margin; radical ones serrate; racemes paniculate, erect; peduncles smooth.
 - Hab. Sandy woods. N. J. to Car. Aug.—Oct. 21.—Stem 2 feet high, very smooth.
- 24. S. virgata Mich.: stem smooth and simple, summit racemose; leaves smooth, lanceolate-oblong, somewhat obtuse, appressed to the stem, diaphanously punctate; the upper ones small and entire; branches of the panicle elongate, racemed at the summit; peduneles erect, smooth, filiform and squarrose.
 - HAB. Swamps. N. J. to Geor. Sept., Oct. 21.—Stem 4—5 feet high, much attenuated. Leaves gradually diminishing upwards; lower ones very large, serrulate. Flowers small.
- 25. S. casia Ait: stem erect, smooth; leaves lanceolate, smooth; racemes erect; rays middle-sized.

- Hab. Sandy woods. N. J. to Car. Aug.—Oct. 21.—Stem 2 feet high, very smooth and glaucous. Racemes not very compact, sometimes slightly recurved. Leaves sometimes scabrous on the margin, finely and acutely serrate.
- 26. S. hispida Willd.: stem erect, hispid, scabrous; leaves lanceolate, scabrous, entire; radical ones serrate; racemes erect; rays middle-sized.

HAB. Fields and woods. N. J. to Virg. Oct. 21.—Resembles S. eæsia.

27. S. lithospermifolia Willd.: stem branched, pubescent; leaves lanceolate, scabrous on both sides, attenuate, 3-nerved, very entire; racemes erect; rays elongated.

HAB. Sandy woods. N. J. to Car. Aug.-Oct. 21.-Pursh.

28. S. lavigata Ait.: stem erect, smooth; leaves lanceolate, fleshy, very entire, very smooth; racemes paniculate, erect; peduncles scaly, villous; rays elongated.

HAB. Salt marshes. Can. to Virg. Sept., Oct. 21.—Stem 4-5 feet high. Radical leaves somewhat ovate. Rays about 10.

29. S. viminea Ait.: stem erect, subpubescent; leaves linear-lanceolate, membranaceous, attenuate at base, smooth, scabrous on the margin; lower ones slightly serrate; racemes erect; rays elongated.

HAB. Banks of streams. Can. to Virg. Aug. - Oct. 21.

- 30. S. limonifolia Pers.: stem oblique, smooth; leaves lanceolate, somewhat fleshy, entire, smooth on both sides; racemes panicled, erect; peduncles scaly, smooth; rays long.—S. mexicana Willd. Pursh.
 - HAB. Salt marshes. N. S. S. to Car. Aug.—Oct. 21.—Stem 3—5 feet high, generally purple, Leaves sessile, lower ones very large. Racemes generally erect, rarely recurved. Flowers large.
- 31. S. macrophylla Pursh: lower leaves ovate, acuminate, attenuate, unequally and acutely serrate, smooth; cauline ones lanceolate, attenuate at each end, nearly sessile, serrate; racemes axillary, pedunculate, leafy, as long as the leaves; involucre oblong, turgid, many-flowered; rays somewhat elongated.
 - HAB. Woods, near White mountains. Big. Can. Pursh. Aug. 21.—Stem 3 feet high. Flowers yellow, in short axillary racemes.—This plant, which is described by Pursh, from a specimen in the Banksian Herbarium, he thinks intermediate between this genus and Aster. According to Dr. Bigelow it has broader leaves than any other species, sometimes rough beneath.
- 32. S. flexicaulis Linn.: stem flexuous, smooth, angled; leaves ovate, acuminate, serrate, smooth; racemes erect, axillary; rays middle-sized,—and S. latifolia Muhl.
 - Hab. Woods. Can. to Car. Aug.—Oct. 21.—Stem 2—3 feet high, slender and flexuous. Racemes scattered, as long as the stem, small, axillary, erect.

- 33. S. axillaris Pursh: stem smooth, terete, very erect; leaves lanceolate, serrate, smooth; racemes axillary, subglobose, ereet; rays elongated.
 - IIAB. Woods. Can. to Virg. Aug.—Oct. 21.—Stem 2—3 feet high. Lawes narrow-lanecolate.—This species, which is quite common, is distinguished from the former by its narrower leaves and by its compact, somewhat globular racemes, clustered along the stem.
- 34. S. rigaurea Linn.: stem erect, terete, pubeseent and branching at the top; cauline leaves lanceolate, serrate, attenuate at each end; lower ones elliptic, somewhat hairy; racemes erect; rays elongated.
 - alpina Big.: a few inches in height, with obovate or laneeolate, mostly entire, leaves.
 - Hab. Woods on the sides of the White Mountains. Big. N. to Labrador. Aug.—Oct. 21.—Stem flexuous, 1—3 feet high. Leaves elliptic or lanceolate, often with a long narrow base, serrate; the upper ones nearly entire. Flowers in a large paniele, yellow; rays 5—10.—Distinguished from all other species by its much larger flowers. Common to Europe, Asia and America. Var. b. is found, according to Dr. Bigelow, on the alpine summits of the White Mountains.
- 35. S. rigida Linn.: stem hairy and scabrous; leaves ovate-oblong, rough with minute hairs; those of the stem very entire, lower ones serrate; flowering branches paniculate; racemes compact; seales of the involucre obtuse; rays elongated.
 - HAB. Mountains. N. J. to Car. Aug. Oct. 21. Stem 3-4 feet high, very pubescent when young. Flowers large, somewhat clustered near the summits of the branches, forming a somewhat fastigiate corymb.
- $36.\ S.\ norchoraccns is\ Linn.:$ radical leaves ovate-oblong, petiolate; stem nearly naked, with fastigiate branches.
 - Hab. Sandy fields. N. Y. Muhl. Sept. Oct. 21.—Stem 3 feet high. Leaves rough. Flowers large.
- 37. S. squarrosa Muhl.: stem thick, pubescent above; leaves smooth, lower ones very broad, spathulate oval, serrate, acute, margin scabrous; the upper sessile, lanceolate-elliptic, entire; racemes glomerate, rigid and pubescent; involucre squarrose, many-flowered; rays elongated, 10 or 12.
 - Hab. Rocky hills. Ver. to Geor. Sept. 24.—Stem 2-3 feet high, always simple. Racemes axillary, thick and crowded, forming a compound spike.—Well distinguished by its squarrose involucre.
- 38. S. puberula Nutt.: stem simple and terete, somewhat pubescent; leaves lanceolate, entire, on each side minutely pubescent, attenuated at each end; radical ones subserrate; racemes spiked, axillary, erect and condensed; peduncles pubescent; scales of the involuere linear-lanceolate, acute; rays clongated, about 10.

HAB. Sandy fields. N. J. Nutt. 21.—Stem brownish, 1—2 feet high. Racemes shorter than the lower leaves, collected into a leafy spike; rays bright yellow.—Resembles S. ncmoralis.

* Scales of the ealyx agglutinated. Ray florets 10-20, very small, yellow.

Receptaele setose. Euthamia. Nutt.

39. S. lanceolata Ait: stem much branched, angular, hairy; leaves lanceolate-linear, very entire, nearly erect, 3--5-nerved, somewhat scabrous on the margin, nerves beneath minutely hispid; corymbs terminal, fastigiate; branches clustered; rays 15-20, as long as the disk. —Chrysocoma graminifolia Linn.—Euthamia graminifolia Nutt.

Hab. Fields and meadows. Can. and N. S. N. to Subarc. Amer. Sept., Oct. 24.—Stem 2—3 feet high, with the branches very numerous. Flowers numerous, clustered in a terminal corymb.

40. S. tenuifolia Pursh: stem angled, scabrous, with fastigiate branches; leaves very narrow, linear, spreading, obscurely 3-nerved, scabrous on the margin, the axils leafy; corymbs terminal, fastigiate, heads clustered; rays about 10, scarcely as long as the disk.—S. lunceolata var. minor Mich.—Euthamia tenuifolia Nutt.

HAB. Pine barrens. N. J. to Flor. Sept., Oct. 21.—Stem 12—18 inches high. Leaves linear, covered with glandular dots. Scales of the involucre viscid.—Every way smaller than the preceding.

26. CHRYSOCOMA. Linn.

Involucre imbricate, oblong or hemispherical. Style scarcely exserted. Receptacle naked. Pappus pilose, scabrous. Rays crowded and unequal. Acines pubescent.

Syngenesia. Æqualis.

C. virgata Nutt: herbaceous and every where smooth; stem virgately branched; branches corymbiferous, fastigiate; leaves all narrow and linear; involucre oblong, 3—4-flowered; scales glutinous and appressed.

HAB. Swamps. N. J. 2f.—Stem 18 inches high and branched nearly from the base. Leaves 1—2 inches long, smooth and

thickish, somewhat remote. Flowers yellow.

27. BOLTONIA. L'Herit.

Involucre imbricate. Rays numerous. Receptacle conic, punctate. Acines flat and margined. Pappus consisting of many minute setæ, with two of them opposite and mostly elongated. Syngenesia. Superflua.

1. B. glastifolia L'Herit: lower leaves serrate; flowers on short peduncles; seeds obcordate, conspicuously winged, pubescent; awns of the pappus 2, nearly of its own length.

HAB. Banks of streams. Penn. to Virg. July, Aug. 21.—Stem 2 feet high. Leaves linear, alternate. Flowers reddish. 2. B. asteroides L'Herit: leaves entire; flowers on long peduncles; seeds oval, smooth, nearly awnless.—Chrysanthemum carolinianum Walt.

HAB. Swamps. N. S. to Car. W. to Ill. Aug. 24.—Stem 1—2 feet high. Leaves lanceolate. Rays flesh coloured.

SUBORDER IV. EUPATORINE Æ.

28. KUHNIA. Linn.

Involucre imbricate, cylindric. Receptacle naked. Pap pus plumose. Seed pubescent, many-striate.

Syngenesia. Æqualis.

1. K. eupatorioides Linn.: smooth; leaves petiolate, broad-lanceolate, serrate; corymb terminal, few-flowered, crowded.

HAB. Shady woods. Penn. to Virg. Aug., Sept. 21.—Stem 2-3 feet high. Flowers white. Resembles an Eupatorium.

2. K. eritonia Linn.: pubescent; leaves narrow-lanceolate or linear, petioled, punctate and glandular beneath; panicle terminal, divaricate.—Critonia kuhnia Mich.

HAB. Mountains. Penn. and Virg. Aug., Sept. 24.—Flowers pale yellow. Seed striate. Pappus of 24 rays.

29. EUPATORIUM. Liun.

Paris

Involucre imbricate, oblong. Style long, deeply cleft. Receptacle naked. Pappus hairy, generally scabrous. Acines smooth, 5-striate or angled. Syngenesia. Equalis.

* Involucre 3-5-flowered.

1. E. hyssopifolium Linn.: stem erect; lowest leaves opposite, lanceolate-linear, slightly toothed; corymb nearly fastigiate; style much larger than the corol.

HAB. Pine woods. N. J. to Car. Aug., Sept. 21.—Stem 1—2 feet high. Leaves small, punctate. Flowers in a terminal corymb, white, sprinkled with glandular dots.

2. E. linearifolium Walt.: stem somewhat procumbent, villous towards the summit; stem leaves opposite, lanceolate-linear, rarely toothed, sometimes clustered; style as long as the corol.

HAB. Sandy fields. N. J. to Car. Aug.—Nov. 21.—Stem generally procumbent, 1—2 feet long, almost viscidly-pubescent. Flowers in an irregular corymb, white.—This species seems to have been confounded with the preceding, by both Walter and Michaux. I have adopted the characters given by Elliott.

3. E. lanccolatum Willd.: leaves sessile, distinct, oblong-lanceolate, scabrous, deeply serrate at base; scales of the involucre similar coloured.

HAB. Dry woods. Penn. to Virg. Aug.—Nov. 24.—Resembles the preceding.

- 4. E. verbenafolium Mich.: leaves sessile, ovate-lanceolate, oblong, notched and toothed, rugose, scabrous; flowers small.—E. teuerifolium Willd. Pursh.
 - Hab. Low woods. N. Y. to Car. Aug.—Nov. 21.—Stem 1—2 feet high, pubescent. Leares opposite, somewhat deltoid, very hairy beneath. Flowers in a fastigiate corymb, small, white.—Michaux's name for this species has the claim of priority, and as Mr. Elliott remarks, is equally, perhaps more appropriate.
- 5. E. melissoides Willd.: leaves petiolate, ovate, somewhat obtuse. obtusely serrate, veined, nearly smooth.
 - Har. Penn. Muhl. Aug.—Oct. 21.—Resembles the last, but the leaves are smaller, petiolate and smooth. Still a doubtful species.
- 6. E. rotundifolium Linn.: leaves sessile, distinct, roundish-cordate, obtusely serrate, veined; scales of the involucre acuminate.
 - HAB. Shady woods. Can. to Car. Aug.—Nov. 24.—Stem 12—18 inches high. Leaves large. Flowers subfastigiate.
- 7. E. pubescens Willd.: stem paniculate, pubescent; branches fastigiate; leaves sessile, distinct, ovate, scabrous, veined; lower ones doubly serrate; upper ones subserrate.
 - HAB. Sandy woods. N. J. to Car. Aug.—Oct. 21.—Stem 2 feet high, the lower branches opposite. Leaves thin and slightly scabrous. Flowers in a fastigiate corymb, white.
- 8. E. ccanothifolium Willd.: leaves petioled, ovate, acuminate, dentate, 3-nerved, glabrous.
 - HAB. Shady woods. N. Y. to Virg. Aug.—Nov. 24.—Resembles Ceanothus americanus in its foliage exceedingly.
- 9. E. oratum Big.: hairy and scabrous; leaves opposite, sessile, ovate, obtusely toothed; corymb fastigiate; involucre about 8-flowered.
 - Hab. Low grounds. Mass. July, Aug. 24.—A stout rough species, 3—4 feet high. *Leaves* perfectly ovate. *Flowers* white, in a level topped corymb.
- 10. E. altissimum Linn.: leaves subsessile, lanceolate, 3-nerved, attenuate at each end, pubescent; lower ones serrate in the middle.
 - Hab. Sandy woods. Penn. to Virg. W. to the Miss. Aug.— Oct. 21.—Stem 3—7 feet high.
- 11. E. amanum Pursh: leaves on short petioles, opposite and ternate, lanceolate-oblong, acute at each end, serrate, nearly smooth, somewhat rugose, reticular-veined beneath; panicle corymbose-fasciculate, crowded; scales of the involucre oblong, somewhat acute, coloured.
 - Hab. Mountains. N. J. Sept., Oct. 21.—Stem 2 feet high, solid, smooth, purple; peduncles tomentose. Flowers small, in a crowded corymbose panicle, pale purple.
- 12. E. trifoliatum Linn.: leaves petiolate, in threes or fours, ovate, attenuate at each end, serrate, somewhat scabrous.

- HAB. Banks of streams. N. Y. to Virg. W. to Miss. Aug.—Oct. 21.—Stem 2—4 feet high, solid. Flowers in a large corymb, purple.
- 13. E. scssilifolium Linn.: stem nearly smooth; leaves sessile, clasping, distinct, ovate-lanceolate, round at base, serrate, very smooth.
 - HAB. Rocks on mountains. Mass. to Car. Aug., Sept. 21.—
 Stem obscurely angled. Leaves opposite, but not connate, minutely dotted beneath. Flowers in a terminal corymb, white.

14. E. truncatum Muhl.: stem pubescent; leaves sessile, clasping,

distinct, lanceolate, truncate at base, serrate, nearly smooth.

- HAB. Shady woods. Penn. to Car. July—Sept. 21.—Stem slightly hairy.—Very similar to E. sessilifolium, yet sufficiently distinct by a stem pubescent; leaves truncate at base, the serratures larger and more obtuse, and the involucre more pubescent. Willd.
- 15. E. album Linn.: leaves nearly sessile, oblong-lanceolate, somewhat scabrous, serrate; the inner scales of the involucre long, lanceolate, scarious, white.—E. glandulosum Mich.
 - Hab. Woods. Penn. to Car. Aug.—Oct. 21.—Stem erect, 11-2—2 feet high, villous. Involuce with glandular dots. Flowers in fastigiate corymbs, white.

** Involucre many-flowered.

- 16. E. purpureum Linn.: stem smooth and glaucous, hollow; leaves petiolate, in fours or fives, ovate-lanceolate, serrate, rugose-veined, somewhat scabrous.
 - Hab. Wet woods. Can. to Virg. Aug.—Oct. 24.—Stem 5—6 feet high, purplish. Flowers in a large terminal corymb, pale purple.
- 17. E. maculatum Linn.: stem solid, furrowed; leaves petiolate, in fours or sixes, ovate-lanceolate, unequally serrate, pubescent beneath.
 - HAB. Low grounds. Can. to Car. Aug.—Oct. 21.—Stem 4—5 feet high, furrowed and dotted with purple. Leaves pubescent and slightly scabrous beneath. Involucre 5—8-flowered; corol purplish.
- 18. E. rerticillatum Muhl.: stem solid, smooth; leaves petiolate, in threes or fours, ovate-lanceolate, acuminate at each end, unequally serrate, nearly smooth.—E. purpurcum Mich.
 - Hab. Low grounds. N. Y. to Car. Aug.—Oct. 21.—Stem 4—6 feet high, tinged with purple. Leaves large, smooth, dotted beneath. Flowers in a terminal corymb, purple.
- 19. E. punctatum Willd.: stem solid, terete; leaves petioled, in fours or fives, ovate, acuminate, serrate, scabrous on both sides.
 - HAB. Mountains. N. J. and Penn. Aug.—Oct. 21.—This plant is described by Pursh as not so tall as the preceding—with the flowers purple and very ornamental. It may be only a variety.

20. E. perfoliatum Linn.: stem villous; leaves connate-perfoliate, oblong, becoming gradually narrower, serrate, rugose, tomentose be-

neath .- E. connatum Mich.

Hab. Swampy grounds. Can. to Flor. W. to Miss. Aug., Sept. 24.—Stem 2—4 feet high, hairy, branched at the top. Leaves large. Flowers in large corymbs, white.—The whole plant is bitter, and is used as a tonic. Big. Med. Bot i. 33. Anderson's Inaugural.

Boneset. Thoroughwort.

*** Involucre simple.

21. E. aromaticum Linn.: stem paniculate at the summit; leaves petiolate, ovate, acute, 3-nerved, obtusely serrate, smooth; flowers in corymbs; involucre simple.

HAB. Low woods. Penn. to Flor. Aug., Sept. 21 .- Stem 2 feet high, pubescent. Flowers in small corymbs, large, white

and aromatic.

22. E. ageratoides Linn.: leaves petioled, ovate, acuminate, 3-nerved, unequally and coarsely serrate, smooth; corymb many-flowered,

divaricate; involucre subsimple.— E. urticafolium Mich.

HAB. Woods and rocky hills. Can. and N. S. W. to Miss. Aug.-Oct. 24.-Stem 2 feet high, round and smooth. Leaves opposite, the lower ones on long petioles and somewhat cordate. Flowers small, white, in small panicled corymbs.

30. CŒLESTINA. Cassin. Spreng.

Involucre imbricate. Receptacle naked. Acines angled, Syngenesia. Æqualis. with a membranaceous crown.

C. carulea Cassin: perennial; leaves petioled, cordate-ovate, somewhat obtuse, obtusely serrate, 3-nerved, scabrous; involucre manyleaved; flowers in corymbs. - Eupatorium calestinum Linn.

Hab. Woods. Penn. to Car. W. to Miss. Aug.—Oct.—Stem
 2—3 feet high, pubescent. Leaves on petioles, opposite, sometimes deltoid. Flowers in close fastigiate corymbs, fragrant, light blue. Involucre about 30-leaved, 40—60-flowered.

SUBORDER V. JACOBEÆ.

31. MIKANIA.

Involucre 4-6-leaved, equal, 4-6 flowered. Receptacle naked. Style long, deeply cleft. Pappus pilose.

Syngenesia. Æqualis.

1. M. scandens Willd .: stem climbing, smooth; leaves cordate, repand-toothed, acuminate, with the lobes divaricate and unequal; flowers in corymbs. - Eupatorium scandens Linn.

HAB. Low grounds. Can. to Car. July-Sept. 21 .- A twining plant. Flowers bluish-white, in axillary corymbs.

Climbing Thoroughwort.

2. M. pubescens Nutt.: stem climbing, pubescent; leaves cordate. acuminate, angularly toothed, and with the calyx pubescent; lobes divaricate, equal.

HAB. Low grounds. Penn. to Car. Sept. 21.-Flowers pale purple, odorous, in paniculate coryinbs which are axillary and

terminal .- Nearly allied to the preceding.

32. CACALIA. Linn.

Involucre cylindric, oblong, the base only somewhat scaly. Receptacle naked. Pappus hairy. Syngenesia. Æqualis.

- 1. C. suaveolens Linn.: stem herbaceous; lcaves petiolate, hastatcsagittate, serrate, smooth, similarly coloured on both sides; flowers corymbed, erect; involucre many-flowered.
 - HAB. Banks of streams. Penn. to Car. Aug., Sept. 21 .- Stem 3-4 feet high. Leaves large. Flowers white, with yellow anthers. - According to Mr. Nuttall it is a Senecio.
- 2. C. atriplicifolia Linn.: stem herbaceous; leaves petioled, smooth, glaucous beneath; radical oncs cordate, toothed; cauline ones rhomboidal, somewhat toothed on each side; flowers corymbed, erect; involucre 5-flowered.
 - HAB. Low ground. Can. to Car. Aug., Sept. 21.-Stem 3-6 feet high. Peduncles almost white. Flowers nearly white, in a small terminal corymb.
- 3. C. reniformis Willd.: stem herbaceous; leaves petioled, smooth, hairy on the veins beneath; radical ones broad-cordate, reniform, repand-toothed: cauline oblong, toothed, wedgeform and very entire at base; corymbs fastigiate; involucre many-flowered.

Hab. Low grounds. Penn. to Virg. W. to Miss. Aug., Sept.21.—Stem 5—8 feet high. Flowers white.

33. TUSSILAGO, Linn.

Involucre simple, swelling; scales equal, even with the disk and submembranous. Receptacle naked. Pappus simple. (Flowers mostly polygamous, dioecious.) Fertile florets ligulate or tubular. Syngenesia. Superflua.

- 1. T. frigida Linn.: scape with a fastigiate many-flowered thyrse; flowers radiate; leaves roundish, unequally toothed, tomentose beneath.
 - HAB. Mountains. Can. and N. S. June. 24.-Stem 5-10 iches high. Florets of the ray white; of the disk pale purple.
- 2. T. palmata Ait.: scape with a fastigiate thyrse; flowers obscurely rayed; leaves roundish-cordate, half 7-lobed, incisely toothed, tomentose beneath.
 - HAB. Swamps. Fairhaven, Ver. Islands of Lake Huron. Nutt. N. to Labrador. April, May. 21 .- The leaves of this species

are aptly compared by Mr. Nuttall to those of the Podophyllum peltatum, although they are not so large.

3. T. farfara Linn.: scape 1-flowered, bractcate; flowers rayed; leaves cordate, angular, toothed, pubescent beneath.

Hab. Low grounds. April. 21.—Stem 6—10 inches high. Flowers appearing before the leaves. Introduced? Colt's foot.

34. SENECIO. Linn.

Involucre cylindric, scaly at base; scales withered at the points. Receptacle naked. Pappus simple, capillary and copious.

Syngenesia. Superflua.

* Flowers radiate.

1. S. gracilis Pursh: radical leaves on very long petioles, orbicular, subcordate, crenate; cauline ones few, very remote, linear-oblong, dilated at base, incisely toothed; peduncles very short, hairy, somewhat umbelled; involucre smooth; rays few, very short.

Hab. Rocky banks. Penn. N. to Subarc. Amer. May—Aug. 21.—Stem a foot high, very slender. Flowers small, yellow.

2. S. oboratus Willd.: stem smoothish; radical leaves obovate, crenate-serrate, petiolate; cauline ones pinnatifid, toothed; flowers somewhat umbelled, on long peduncles.

Hab. Rocky hills. N. Y. to Virg. June, July. 2f.—Stem a foot high, simple. Flowers in small terminal panicles. Rays 10—12, yellow.

3. S. balsamita Willd.: stem and peduncles villous at the base; radical leaves oblong, serrate, petiolate; lower cauline ones lyrate-pinnatifid, serrate; upper pinnatifid-toothed; flowers somewhat umbelled.—S. lyratus Mich.

Hab. Damp grounds. Can. to Car. N. to Subarc. Amer. June,
 July. 24.—Stem 1—2 feet high, smooth except at the base.
 Flowers in small terminal umbels. Rays 10—12, deeply 3-cleft.

4. S. aureus Linn.: radical leaves ovate, cordate, serrate, petiolate; cauline ones pinnatifid, toothed, the terminal segments lanceolate; peduncles thickened; flowers somewhat umbelled.

Hab. Shady woods. Can. to Car. N. to Subarc. Amer. June, July. 24.—Stem 2 feet high. Radical leaves on long petioles. Flowers in a simple terminal umbel, yellow.

5. S. dubius Beck: woolly and tomentose; radical leaves on long petioles, spathulate-obovate and ovate, somewhat acute and pinnatifid; cauline ones 2—3, linear, pinnatifid; flowers corymbed.—S. heterophyllus Nutt. Torr.—Cineraria heterophylla Pursh.—C. dubia Spreng.

Hab. Rocks in Blue Mountains. Penn. Pursh. May, June. 21.—Stem about a span high. Flowers deep yellow.—I have followed Mr. Nuttall and Dr. Torrey in placing this plant under genus Senecio, although there is still some doubt whether it really belongs to this or to Cineraria. Mr. Nuttall thinks it a variety of C. integrifolia of Willdenow and Pursh, a plant which

is still retained under the latter genus by Dr. Richardson, (App. to Frank. Jour.) and by Dr. Torrey, in his account of plants collected during a journey to the Rocky Mountains by Dr. E. James. I have changed the specific name, as that of hetero phyllus had been long since applied to another Senecio from the Cape of Good Hope.

** Florets tubular: those of the ray wanting.

6. S. rulgaris Linn.: leaves mostly clasping, pinnatifid, toothed; flowers in crowded corymbs.

HAB. Cultivated grounds. N. S. May—Oct. 21.—Stem 18 inches high. Flowers yellow. Introduced. Groundsel.

7. S. hieracifolius Linn.: stem virgate, paniculate; leaves clasping, oblong, acute, unequally, acutely and deeply toothed; involucre smooth; seeds pubescent.

HAB. Road sides, &c. Can. to Car. July, Aug. . Stem 2—6 feet high, succulent, branching towards the summit. Flowers in a compound terminal paniele, white. Fire Weed.

8. S. clongatus Pursh: smooth; radical leaves spathulate, serrate, attenuated into a petiole; cauline ones pinnatifid, toothed, very remote; peduncles elongated, umbelled, corymbed.

HAB. Rocks on banks of streams. Penn. July, Aug. 24 .-

Resembles S. balsamita, but is destitute of ray florets.

SUBORDER VI. HELIANTHEÆ.

35. HELENIUM. Linn.

Involucre simple, many parted. Rays deeply 3-cleft. Pappus chaffy; chaff 5-awned. Receptacle globose, naked, chaffy on the margin. Acines villous.

Syngenesia. Superflua.

 $H.\ autumnale\ Linn.\ :$ leaves lanceolate, serrate, decurrent; flowers in corymbs; florets of the disk 5-cleft; of the ray flat, reflexed.

Hab. Low grounds. Can. to Car. W. to Miss. Sept., Oct. 21.—Stem 2—3 feet high, winged by the decurrent leaves. Flowers in small corymbs, yellow.—Whole plant intensely bitter.

American Sneezewort.

36. HELIANTHUS. Linn.

Involucre imbricate, generally squarrose, leafy. Receptacle chaffy, flat. Pappus 2-leaved, caducous.

Syngenesia. Frustranea.

* Florets of disk dark purple.

1. H. atrorubens Linn.: hispid; stem naked towards the summit, loosely paniculate; leaves opposite, spathulate, oblong-ovate, crenate, 3-nerved, scabrous on the upper side; scales of the involucre ovatelanceolate, as long as the disk.

- HAB. Gravelly soil. Penn. to Car. W. to Miss. Aug., Sept. 21.—Stem 3—4 feet high, somewhat branched. Lower leaves very large. Flowers in a loose terminal panicle. Rays yellow; disk dark purple.
- 2. H. angustifolius Linn.: stem slender, slightly scabrous; leaves narrow-lanceolate, entire, glaucous beneath, with the margin revolute, the upper ones alternate; scales of the involucre linear-lanceolate, ciliate, spreading; chaff 3-toothed.—Rudbeckia angustifolia Willd.

Hab. Cedar swamps. N. J. to Flor. Sept.—Nov. 21.—Stem 2—3 feet high, sparingly branched. Leaves opposite below, alternate above, scabrous on the upper surface. Flowers small, terminal. Rays about 12, yellow; disk dark purple at the summit.—I have adopted the specific description of Mr. Elliott.

** Florets of the disk yellowish.

† Leaves opposite.

- 3. H. divarieatus Linn.: stem smooth, branched; leaves ovate-lanceolate, 3-nerved scabrous above, smooth beneath; panicle trichotomous; flowers small.
 - Hab. Woods. Can. to Car. Aug.—Oct. 21.—Stem 5—6 feet high, di- and tri-chotomously divided. Leares on long petioles, rounded at base, and tapering to a long almost acuminate point; upper ones often alternate. Flowers small, in terminal panicles.
- 4. H. trachelifolius Willd.: leaves ovate-lanceolate, acuminate, serrate, 3-nerved, very scabrous on both sides; scales of the involucre linear-lanceolate, ciliate, outer ones larger.—H. gigas Mich.
 - Hab. Woods. Can. to Car. Aug.—Oct. 21.—Stem 3—4 feet high, branching towards the summit, very scabrous. Leaves attenuated at base into a short petiole. Flowers in a loose terminal panicle. Rays 10—12.—This species is united by Sprengel with H. decapetalus.
- 5. H. frondosus Willd.: stem smooth below; leaves ovate, acutely serrate, peduncles scabrous; involucre squarrose, undulate, leafy, ciliate; rays 8-flowered.
 - HAB. Woods. Can. and N. S. Aug., Sept. 21.—Stem 4 feet high. Flowers small.—Resembles H. decapetalus and multiflorus in several respects, but is distinct. Pursh.
- 6. H. mollis Willd.: stem smooth below, scabrous near the summit; leaves ovate-lanceolate, acute, serrate, scabrous above, pubescent and hoary beneath; flowers-few, terminal.
 - Hab. Low grounds. Penn. to Car. July—Sept. 21.—Stem 3—6 feet high, purple, smooth except near the top. Flowers few, in a terminal panicle. Rays about 10.—This is the H. mollis of Elliott, which, although it agrees in most points with Pursh's description, is not according to the former author H. tomeutosus of Michaux.

†† Upper leaves alternate.

7. H. giganteus Linn. : leaves alternate, lanceolate, serrate, scabrous,

obscurely 3-nerved, tapering at each end, nearly sessile, ciliate at base; scales of the involucre lanceolate, ciliate.

- IIAB. Dry swamps. Can. to Car. Aug. Sept. 21.—Stem very tall, branching, rough near the summit. Leaves paler and often nearly smooth beneath. Flowers in a loose terminal panicle. Rays 12—14, not large.
- 8. II. altissimus Linn.: leaves alternate, ovate-lanceolate, serrate, scabrous, 3-nerved, tapering towards the summit, petioled; petioles ciliate; scales of the involucre lanceolate, ciliate.
 - II ab. Mountain meadows. Penn. to Car. July—Sept. 24.—Resembles the preceding, but the stem is smooth and purple. Leaves petiolate, broader and almost ovate-lanceolate. Scales of the involucre shorter. Florets of the ray about 16. Willd.--Pursh says the chaff of the receptacle is green in this species, but black in the preceding.
- 9. II. strumosus Linn.: leaves ovate, acuminate, serrate, 3-nerved, scabrous beneath; scales of the involucre linear-lanceolate, ciliate at base.
 - Hab. Can. and N. Eng. Aug.—Oct. 21. Pursh.—Under the above name Mr. Elliott describes a plant found in North-Carolina; but it seems doubtful whether it is really the same. Stem tall, slender, sparingly branched and smooth. Leaves lanceolate or ovate-lanceolate, acuminate, serrate, thin, slightly scabrous on both sides, paler beneath. Flowers small, few, terminal. Florets of the ray 8—10. There are probably several species of this genus in the N. S. not now credited to it.
- 10. II. decapetalus Linn.: leaves ovate, acuminate, remotely serrate, 3-nerved, scabrous; scales of the involucre ovate-lanceolate, nearly equal, somewhat ciliate.—II. macrophyllus Willd. Pursh.?
 - HAB. Rocky woods. Can. to Car. Aug.—Oct. 21.—Stem 3—4 feet high, branching. Leaves alternate above, the petioles ciliate at base. Flowers large, in terminal panicles.
- 11. H. multiflorus Linn.: leaves 3-nerved, scabrous, lower ones cordate; upper ones ovate; florets of the ray numerous; scales of the involucre lanceolate.
 - HAB. Mountain woods. Penn. to Car. July-Sept. 24.—Stem and peduncles scabrous. Scales of the involucre 40—50, loosely imbricated, not squarrose.
- 12. H. tuberosus Linn.: leaves 3-nerved, scabrous: lower ones cordate-ovate; upper ones ovate-acuminate; petioles ciliate.
 - Hab. Fields. N. S. July—Sept. 24.—Root tuberous. Stem 4—8 feet high. Naturalized in various parts of the N. S.

Jerusalem Artichoke.

37. HELIOPSIS. Pers.

Involucre imbricate; scales subovate, nearly equal. Rays large and linear. Receptacle chaffy, conic; chaff lanceolate. Seeds 4-angled. Pappus none. Syngenesia. Superflua.

H. heris Pers.: leaves opposite, ovate, serrate, 3-nerved.—Buphthalmum helianthoides Willd.—Helianthus lævis Linn.

Hab. Banks of streams. N. Y. to Flor. Aug., Sept. 21.—
Stem 3—5 feet high, dichotomously branched above. Flowers
solitary, terminal and in divisions of the stem, on long peduncles, large, yellow.

38. RUDBECKIA. Linn.

Involucre nearly equal; scales in a double series. Receptacle conic, chaffy. Pappus a 4-toothed margin.

Syngenesia. Frustranea.

* Involucre imbricate; chaff of the receptacle mucronate.

1. R. purpurca Linn.: very rough; lower leaves broad-ovate, attenuate at base, remotely toothed; cauline ones lanceolate-ovate, acuminate at each end, nearly entire; ray florets very long, deflexed, bifid.

Hab. High grounds. N. Y. to Flor. W. to Miss. July—Sept. 21.—Stem 3—4 feet high, sparingly branched, differing somewhat in the degree of roughness. Leaves also varying much in length and breadth. Flowers large, terminal; rays purple; disk brown.—This plant has been found by Mr Edward Dunn, on the banks of the Hudson, about two miles below this city, which I believe is the most northern station yet discovered. It differs considerably in its generic character from most of the other species, and Mr. Elliott, indeed, suggests its separation from them.

** Involuere nearly equal; chaff unarmed.

2. R. fulgida Ait.: stem hispid, the branches long. virgate and 1-flowered; leaves oblong-lanceolate, denticulate, hispid, narrowed and slightly cordate at base; scales of the involucre as long as the ray; chaff lanceolate.—R. chrysomela Mich.

Hab. Mountains. Penn. to Car. July—Oct. 24.—Stem 2-3 feet high, branched. Ray florets 12-14, 2-cleft at the summit, yellow, scarcely longer than the leafy scales of the involucre.

3. R. hirta Linn.: very hirsute; stem virgate, sparingly branched, 1-flowered; peduncles naked; leaves ovate-spathulate, 3-nerved, serrate, hairy; scales of the involucre imbricate, in a triple series, shorter than the ray; chaff obovate, acute.

Hab. Mountains. N. S. to Flor. W. to Miss. Aug., Sept. 21.—Stem 2-3 feet high, scabrous and hairy. Leaves alternate, sessile or subclasping, very hairy. Flowers solitary, terminal. Ray florets about 14, bifid, hairy, yellow, twice as long as the involucre.

4. R. triloba Linn.: hairy-hispid; stem paniculate; branches divaricate, many-flowered, leafy; leaves lanceolate, acuminate at each end, serrate; the lower ones 3-lobed; scales of the involucre linear, deflexed, as long as the ray.

HAE. Mountains. N. S. to Car. W. to Miss. Aug., Sept.

21.—Stem 4—5 feet high. Flowers numerous, on the summits of the branches. Ray florets about 8, yellow; disk dark purple.

5. R. Laciniata Linn.: stem smooth; lower leaves pinnate, the seg-

ments 3-lobed; upper ones ovate; pappus crenate.

HAB. Borders of swamps. Can. to Car. W. to Miss. Aug., Sept. 21.—Stem 4—6 feet high, branching. Leaves rough, the lower ones pinnate or pinnatifid, with about 5 segments; upper ones nearly sessile, ovate or 3-eleft. Flowers large, yellow, in a loose terminal panicle. Ray florets about 6, 3-toothed.

Conc Flower.

6. R. digitata Ait.: stem smooth; lower leaves pinnate, the segments pinnatifid; the upper ones simple, pinnate; the highest 3-cleft; pappus crenate.

Hub. Mountains. N.S. to Geor. W. to Miss. Aug.—Oct. 21.—Stem 5—6 feet high. Leaves thin, the segments more or less toothed, generally lanceolate. Flowers terminating the branches, yellow.

7. R. pinnata Mich.: stem furrowed, hispid; leaves all pinnate: lower segments sometimes 2-parted; pappus entire.

HAB. Mountains. Penn. Muhl. W. to Miss. S. to Geor. July—Oct. 21.—Flowers very large, yellow. Rays long reflexed; disk ovate, purple.

39. VERBESINA. Linn.

Involucre many-leaved, the leaves in a double series. Rays about 5. Receptacle chaffy. Pappus 2-awned.

Syngenesia. Superflua.

V. siegesbeckia Mich.: stem winged; leaves opposite, ovate-lanceolate, acuminate at each end, acutely serrate; coryinb brachiate; branches irregularly many-flowered at the summit.—Siegesbeckia occidentalis Linn.

HAB. Shady woods. Penn. to Car. July—Sept. 21.—Root creeping. Stem erect, 4—6 feet high, 4-winged. Flowers in large somewhat fastigiate corymbs, yellow; rays 3-toothed.

40. CALLIOPSIS. Reichenbach.

Involucre double; inner one many-parted, coloured; outer erect. Receptacle chaffy. Pappus none.

Syngenesia. Frustranea.

C. rosca Spreng.: small and very smooth; stem mostly simple; leaves linear, entire, axils leafy; flowers few, on long peduncles, axillary, terminal; rays unequally 3-toothed; seeds very entire, naked.—Corcopsis rosca Nutt.

flas. Swamps. N. J. to Geor. Aug. 21.—Stem 12 inches high, smooth and generally simple. Leaves 2 inches long, op-

posite and connate at base. Flowers small, few, on peduncles 3 inches long, pale red.

41. COREOPSIS. Linn.

Involucre double, each many-leaved; the inner one equal, subcoriaceous and coloured. Receptacle chaffy, scales flat. Acines compressed, emarginate, bidentate; dentures rarely awned. Syngenesia. Frustranea.

* Leaves opposite, divided.

1. C. trichosperma Mich.: smooth; leaves generally quinate, pinnate; segments linear-lanceolate, serrate; flowers in coryinbs; leafets of the outer involucre spathulate, ciliate-serrate; rays entire; acines cuneate, 2—4-toothed.

Hab. Swamps. N. J. and Car. Aug., Sept. 3.—Stem 2—3 feet high, branching towards the top. Flowers peduncled, opposite and terminal; rays about 8, lanceolate, yellow.

Tickseed Sunflower.

2. C. tripteris Linn.: smooth; leaves petiolate, lanceolate, very entire; radical ones pinnate; cauline ternate; rays entire; acines obovate, naked at the summit.

Hab. Mountains. Penn. to Car. Aug., Sept. 21.—Stem 4—6 feet high, terete. Flowers rather small, in a loose terminal corymb; rays about 8, yellowish.

** Leaves alternate.

3. C. gladiata Walt: stem smooth, dichotomous towards the summit; leaves narrow-lanceolate, entire, thick, tapering into a petiole; acines obovate, winged, the wings serrulate; pappus 2-awned, bristly.—C. dichotoma Mich.

HAB. Swamps. N. J. and Car. July—Sept. 3.—Stem 2—3 feet high, simple and slender. Leaves thick, 3—6 inches long. Flowers terminal; rays 8, dilated, trifid-yellow; disk dark purple.

4. C. aspera Pursh: leaves lanceolate-linear, rough; upper ones alternate; lower opposite; stem 1-flowered.

HAB. In Maryland. Pursh.

42. ACTINOMERIS. Nutt.

Involucre simple, many-leaved; leaves nearly equal. Rays remote, elongated, (4 to 8.) Receptacle small and chaffy, the scales embracing the margin of the acines. Acines compressed and marginated, with the summit persistently 2-awned.

Syngenesia. Frustranea.

A.? squarrosa Nutt.: stem erect, winged, pubescent towards the summit; leaves lanceolate, serratc, scabrous; panicle loose, leafy;

involucre spreading; receptacle nearly globose.—Corcopsis alternifolia Linn.—Verbesina corcopsis Mich. Spreng.

HAB. Penn. to Car. July—Sept. 21.—Stem 3-4 feet high.

Leares alternate. Flowers varying, yellow and white.—There seems to be still some doubt with regard to its generic character.

43. BIDENS. Linn.

Involucre double, the outer unequal. Ray florets frequently wanting. Receptacle chaffy, flat. Pappus of 4 reflected or creet and retrosely scabrous awns. Acines 4-angled.

Syngenesia. Frustranea.

1. B. cernua Linn.: flowers subradiate, cernuous; outer involucre as

long as the flower; leaves lanceolate, subconnate, dentate.

HAB. Near ponds and ditches. Can., N. Y. and Penn. W. to Miss. Aug.—Sept. O.—Stem 1—2 feet high. Ray florets as in all the species, yellow, often wanting.—This plant is sometimes not more than 8 inches high, with very small erect flowers, when it constitutes the variety minima.

Water Beggar-ticks.

2. B. chrysunthemoides Mich.: flowers radiate, nodding; florets of the ray thrice as long as the nearly equal involucre; leaves oblong, tapering at each end, toothed, connate at base.

Hab. Wet places. N. Y. to Car. Aug., Sept. . — Stem 1—3 feet high. Leaves glabrous. Flowers erect, yellow. Acines commonly with 4 awns. — From the remarks of Mr. Elliott, it is not improbable that several distinct species are covered under the above name.

3. B. frondosa Linn.: flowers discoid; outer involucre six times as long as the flower, its leafets ciliate at base; lower leaves pinnate; upper ones ternate, lanceolate, serrate.

HAB. Woods and fields. N. Y. to Car. Aug., Sept. O.— Stem 3—4 feet high, branching. Flowers terminal, erect, surrounded by a large leafy involucre. Rays none. Acines 2-awned.

Burr Marygold.

4. B. connata Willd.: flowers discoid; outer involucre thrice as long as the flower; cauline leaves ternate; lateral ones connate; floral oblong-lanceolate.

Hab. Fields. Can. to Car. July—Sept. . Stem 2 feet high. Peduncles opposite, 1-flowered.

5. B. bipinnata Linn.: flowers somewhat rayed; outer involucre as long as the inner; leaves bipinnate; leafets lanceolate-pinnatifid.

HAB. Near cultivated grounds. Penn. to Car. July—Sept. O.— Stem 2—4 feet high. Flowers on long, mostly terminal peduncles. Rays 3, or none, obovate, yellow.

6. B. beckii Torr.: stem subsimple; submerged leaves capillaceous-multifid; emersed ones lanceolate, connate, acutely serrate or laciniate; flowers rayed; the rays longer than the involucre.

Hab. In water. Can. and N. Y. July, Aug. 24.—Stem 2—3 feet long, simple or with very small and slender branches arising from the axils of the upper leaves. Lower leaves very multifid, capillary, as in Ranunculus aquatilis; upper ones about an inch and a half long, broadly lanceolate, attenuated at each extremity, deeply serrated. Flowers solitary, at the extremity of the stem, rather large, yellow. Rays much longer than the involucre.—This species was first discovered in a pond near Schenectady, N. Y. It has since been found in Canada, by Mr. Goldie, and more recently in the western part of N. Y. by Drs. Asa Gray and William Aikin.

44. POLYMNIA. Linn.

Involucre double; the outer one 4—5-leaved; the inner 10-leaved; leafets concave. Receptacle chaffy. Pappus none. Syngenesia. Necessaria.

1. P. canadensis Linn.: viscid and villous; leaves denticulate, acuminate; lower ones pinnatifid, upper 3-lobed or entire.

HAB. Shady hills. Can. to Car. June, July. 21.—Stem 2-4 feet high. Leaves thin, slightly scabrous. Flowers in a loose terminal panicle, yellow.

2. P. uvedalia Linn.: leaves opposite, 3-lobed, acute, decurrent into a petiole; lobes angled and sinuate; rays elongated.

Hab. Mountains. Penn. to Car. July—Sept. 21.—Stem 3—5 feet high, terete. Leaves opposite or alternate. Flowers in a loose terminal panicle; rays about 10, 3-toothed, yellow.

45. SILPHIUM. Linn.

Involucre leafy, squarrose. Receptacle chaffy. Seeds compressed, obcordate-marginate, 2-toothed.

Syngenesia. Necessaria.

- 1. S. perfoliatum Linn.: stem 4-angled, smooth; leaves opposite, connate, ovate, serrate.
 - Hab. Mountains. Penn. to Car. Aug. 24.—Stem 6 feet high, angled, smooth. Peduneles terminal and from the axils of the highest leaves; rays 24, yellow.
- 2. S. trifoliatum Linn.: stem 6-angled, smooth; leaves verticillate by threes, ovate-lanceolate, unequally toothed and serrate, scabrous on the upper surface; upper ones sessile, panicle trichotomous.—S. ternifolium Mich.
 - Hab. Mountains. N. S. Torr. S. to Car. Sept., Oct. 24.— Stem 4—6 feet high, mostly purple. Flowers in a terminal corymb; rays about 14, long, bright yellow.
- 3. S. ternatum Retz: stem terete, smooth; leaves verticillate by threes, petiolate, lanceolate, slightly toothed, ciliate at base, somewhat scabrous; upper ones scattered, sessile; panicle dichotomous; involucre ciliate.

HAE. Penn. to Car. July. 21.—Stem 4—6 feet high. Flowers in a loose terminal corymb; rays 14, long, yellow.—Mr. Elliott doubts whether the two last species are sufficiently distinct.

SUBORDER VII. AMBROSIACEÆ.

46. IVA. Linn.

Involucre about 5-leaved or 5-parted. Florets of the ray 5, naked. Receptacle bristly. Pappus none. Acines obovate. (Anthers approximate, not united.) Syngenesia. Necessaria.

I. frutescens Linn.: shrubby; leaves opposite, lanceolate, deeply ser-

rate, slightly scabrous; heads globular-depressed.

HAB. Sea coast. N.Y. to Flor. Aug. 21.—Shrub 3—8 feet high, with numerous opposite branches and leaves. Flowers small, in axillary leafy raceme, forming a large terminal panicle.

47. AMBROSIA. Linn.

Monoecious. Sterile Fl. Involucre 1-leaved, hemispherical, many-flowered. Anthers approximate but not united. Receptacle naked. Fertile Fl. Involucre 1-leaved, entire or 5-toothed, 1-flowered. Corol none. Styles 2. Nut formed from the indurated calyx, 1-seeded.

Monoecia. Pentandria.

- 1. A. integrifolia Muhl.: leaves ovate, sessile, acuminate, serrate, hispid on both sides, ciliate at base; racemes terminal and mostly ternate.
 - HAB. Near ponds and ditches. Penn. and Virg. July—Sept. Q.—Pursh.
- 2. A. bidentata Mich.: very hairy; leaves closely sessile, simple, lanceolate, 1—2 toothed on each side near the base; fruit 4-sided, 4-spined below the summit.

HAB. Allegany mountains. W. to Illinois.—Perhaps not in the limits assigned to the present work. July—Sept. Q.

3. A. trifida Linn.: hirsute, rough; leaves 3-lobed, serrate; the lobes oval-lanceolate, acuminate; fruit 6-spined below the summit.

Hab. Banks of streams. N. Y. to Car. W. to Miss. July—Sept. @.—Stem 4—8 feet high. Leaves very large. Flowers in large terminal panicles composed of long axillary and terminal spikes.

4. A. clatior Linn.: stem virgate; leaves bipinnatifid, nearly smooth; petioles conspicuously ciliate; racemes terminal.

HAB. Old fields. Can. to Car. Aug., Sept. ©.—Stem 1—4 (at the south 4—7) feet high. Flowers in paniculate racemes.

Nut with 6 spines.

Hog Weed.

5. A. artemisifolia Linn.: leaves bipinnatifid, hoary underneath, the uppermost pinnatifid; racemes by threes, terminal; branches fastigiate.—A. absynthifolia Mich.

Hab. Fields. Penn. to Car. W. to Miss. Aug., Sept. @.—
Stem 4—6 feet high. Leaves opposite below, alternate above.
Racemes loosely paniculate. Spines of the fruit very short.

6. A. paniculata Mich.: stem branching, paniculate at the summit, and with the petioles villous; leaves green on both sides, bipinnatifid, the segments lanceolate; fruit somewhat clustered, small, obovate, slightly awned.—Iva monophylla Walt.

Hab. Old fields. Can. to Flor. July—Sept. ©. Pursh.— Stem 2-4 feet high. Flowers in simple terminal and axillary

racemes.

7. A. heterophylla Muhl.: stem paniculate; cauline leaves pinnatifid, subdentate, petiolate, those of the branches lanceolate, sessile; petioles with long ciliæ; racemes terminal, solitary.—A. peruviana Willd.

HAB. Banks of streams. Penn. July-Sept. @. Muhl.

48. XANTHIUM. Linn.

Monoecious. Sterile Fl. Involucre imbricate. Anthers approximate, but not united. Receptacle chaffy. Fertile Fl. Involucre 2-leaved, 1-flowered. Corol none. Drupe dry, muricate, 2-cleft. Nut 2-celled.

Monoecia. Pentandria.

1. X. strumarium Linn.: stem unarmed, branching; leaves cordate, lobed, serrate, scabrous, 3-nerved; fruit elliptic, pubescent, armed with rigid hooked bristles.

Hab. Road sides. N. Y. to Car. W. to Miss. Aug., Sept .—Stem 3—6 feet high. Flowers in axillary racemes.

Clot-weed.

2. X. macrocarpon De Cand.: stem unarmed, spotted; leaves cordate, lobed, obscurely sinuate-toothed, scabrous, 3-nerved; fruit oval, densely armed with short rigid uncinate bristles; horns incurved.—X. orientale Linn.—X. maculatum Raf.

Hab. Near salt water. N. S. Aug. . Stem purple, spotted. Fruit very large, woolly.

3. X. spinosum Linn. : spines ternate; leaves 3-lohed.

Hab. Waste ground. Md. to Geor. @.—Stem 3 feet high. Flowers small.

Prickly Clot-wccd.

SUBORDER VIII. ANTHEMIDEÆ.

49. SPARGANOPHORUS. Mich.

Involucre somewhat globose, imbricate, with the scales recurved at the point. Receptacle naked. Acines crowned with a small cartilaginous cup. Syngenesia. Equalis.

S. verticillatus Mich.: leaves linear, verticillate; heads few, terminal; pappus campanulate, 5-toothed.

IIAB. In shallow water. N. J. to Flor. Aug., Sept. 24.—Stem a foot high, simple. Leaves linear, an inch long, 6—8 in a whorl. Flowers purple.

50. TANACETUM. Linn.

Involucre imbricate, hemispherical, scales acuminate. Rays of the corol obsolete, trifid. Receptacle naked. Pappus subemarginate. Syngenesia. Superflua.

T. rulgare Linn.: leaves doubly pinnate, incisely serrate; corymb terminal.

IIAB. Road sides, &c. Aug., Sept. 21.—Stem 2—4 feet high. Flowers in a dense terminal corymb, yellow.—Whole plant odorous. Naturalized. Tansey.

51. ARTEMISIA. Linn.

Involucre imbricate; scales round, connivent. Florets of the ray none. Pappus none. Receptacle naked, or slightly villous. Syngenesia. Superflua.

1. A. vulgaris Linn.: leaves tomentose beneath; cauline ones pinnatifid; segments lanceolate, subdentate, acute; floral ones undivided, linear, lanceolate; flowers nearly sessile, oblong, erect; involucre tomentose.

HAB. Banks of streams. Can. and N. S. N. to Arc. Amer. Sept.—Nov. 21.—Stem 2—3 feet high. Flowers few, purplish.

Mugwort.

2. A. canadensis Mich.: stem herbaceous and paniculate, mostly erect; radical leaves subpinnate, somewhat tomentose; cauline subpinnate; segments subsetaceous, incised, flat, nearly smooth; flowers partly glomerate and sessile; involucre subglobose; scales oval, scarious.—A. campestris Pursh.

HAB. Sandy shores of Lake Erie, &c. W. to Miss. N. to Hudson's Bay. July, Aug. 21.—Stem sometimes decumbent at base, mostly erect, 3—4 feet high. Leaves of linear segments, singly or doubly pinnatifid or subpinnate. Flowers small, very numerous, in terminal panicles resembling spikes. Wild Wormwood.

3. A. caudata Mich.: stem herbaceous, simple, densely and pyramidally paniculate; radical and lower cauline leaves sub-bipinnate, pubescent; upper subpinnate; segments subsetaceous, alternate, divaricate, somewhat convex; flowers pedicillate, erect, globose ovate.

HAB. Sea shores. N. J. to N. Car. 24.—Stem 2-6 feet high.

52. CHRYSANTHEMUM. Linn.

Involucre hemispherical, imbricate; innermost scales scarious. Receptacle naked. Pappus none.

Syngenesia. Superflua.

C. leucanthemum Linn.: stem erect, branching; leaves clasping, anceolate, deeply notched and toothed at the base.

Hab. Fields, &c. Can to Car. June—Aug. 21.—Stem 1—2 feet high, sparingly branched. Flowers solitary on the branches, large; rays white; dish yellow. Introduced. Ox-eye Daisy.

53. ANTHEMIS. Linn.

Involucre hemispherical, subequal. Rays more than 5. Receptacle chaffy; chaff flat, with rigid acuminate points. Pappus none or a membranous margin.

Syngenesia. Superflua.

1. A. arvensis Linn.: leaves bipinnate; segments lanceolate-linear; receptacle conic; chaff lanceolate; acines crowned with a margin.

2. A. cotula Linn. : leaves bipinnatifid; segments subulate, 3-part-

ed; receptacle conic; chaff setaceous; pappus none.

HAB. Road sides. N. Y. to Car. W. to Miss. June—Oct.

©.—Stem a foot high, erect, branched. Flowers solitary, terminal; disk convex, yellow; rays white.—An exotic, now almost every where naturalized.

May-weed.

54. ACHILLEA. Linn.

Involucre ovate, imbricate. Rays 5—10, roundish. Receptacle chaffy. Pappus none. Syngenesia. Superflua.

1. A. ptarmica Linn.: leaves linear-lanceolate, acuminate, equally

and acutely serrate, smooth.

HAB. Dry swamps. Arc. Amer. Can. and N. Y. Aug., Sept. 21.—Pursh. Stem 1—3 feet high, erect, terminating in a large corymb. Flowers white. Introduced.? Sneeze-wort.

2. A. millefolium Linn.: stem furrowed; leaves bipinnate, slightly

hairy; segments linear, toothed, acute.

W. to Miss. June—Aug. 21.—Stem erect, branched at the top. Flowers in large dense terminal corymbs; rays 4 or 5, white or rose coloured.—A powerful astringent. Introduced.?

ORDER LXVIII. CAMPANULACEÆ. Lind.

Calyx superior, usually 5-lobed, (sometimes 3—8,) persistent. Corol monopetalous, inserted into the top of the calyx, usually 5-lobed, (sometimes 3—8,) withering on the fruit, regular; æstivation valvate. Stamens inserted into the calyx

alternately with the lobes of the corol, to which they are equal in number; anthers 2-celled, distinct; pollen spherical. Ovary inferior, with 2 or more polyspermous cells opposite the stamens or alternate with them; style simple, covered with collecting hairs; stigma naked, simple, or with as many lobes as there are cells. Fruit dry, crowned by the withered calyx and corol, dehiseing by lateral irregular apertures, or by valves at the apex, always loculicidal. Seeds numerous, attached to a placenta in the axis; embryo straight, in the axis of fleshy albumen; radicle inferior.

Herbs or undershrubs yielding a white milk. Leaves simple or deeply divided, without stipules.

1. CAMPANULA. Linn.

Calyx mostly 5-cleft. Corol campanulate, the base closed with 5 staminiferous valves. Stigma 3—5-cleft. Capsule inferior, 3- (rarely 5-) celled, opening by lateral pores.

Pentandria. Monogynia.

1. C. rotundifolia Linn.: glabrous; stem erect, slender, somewhat branched at base; radical leaves reniform-cordate, crenate or cut; cauline ones linear, entire; paniele lax, few-flowered.

HAB. Rocky banks. N. S. N. to Subarc. Amer. W. to Rocky Mountains. June, July. 24.—Stem 8—12 inches high. Radical leaves cordate, (withering early.) Flowers few, large, blue, in a loose terminal panicle or raceine. Flax Bell-flower.

2. C. amplexicaulis Mich.: stem simple, erect, angular; angles hispid backwards; leaves cordate, toothed, clasping; flowers sessile, 1—5 in the axil of each leaf.—C. perfoliata Liun.

- 3. C. americana Linn.: stem simple, smooth; leaves ovate-lanceolate, much acuminate, membranaceous, uncinately scrrate; lower ones somewhat cordate, with the petioles ciliate; flowers subsolitary, nearly sessile, in a terminal leafy raceme; corol subrotate; style exserted.— C. acuminata Mich.
 - Hab. Mountains and rocks. Niagara Falls and S. to Goor. July, Aug. 21.—Stem 2—3 feet high. Flowers blue, flat, 1--2 in the axils of the leaves.
- 4. C. aparinoides Pursh: stem slender, much branched, acutely angled; angles with the margin and nerves of the leaves aculeate backwards; leaves linear-lanceolate, sessile, somewhat serrate, smooth

above; flowers solitary, on terminal filiform flexuous peduncles.—C. erinoides Muhl.—C. flexuosa Mich.?

Hab. Wet meadows. Can. to Geor. June, July. . — Stem a foot high, weak. Flowers small, white. Priekly Bell-flower.

ORDER LXIX. LOBELIACEÆ. Lind.

Calyx superior, 5-lobed, or entire. Corol monopetalous, irregular, inserted into the calyx, 5-lobed, or 5-cleft. Stamens 5, inserted into the calyx alternately with the lobes of the corol; anthers cohering; pollen oval. Ovary inferior, with from 1 to 3-cells; ovules very numerous, attached either to the axis or the lining; style simple; stigma surrounded by a cuplike fringe. Fruit capsular, 1 or more celled, many seeded, dehiscing at the apex. Seeds attached either to the lining or the axis of the pericarp; embryo straight, in the axis of fleshy albumen; radicle pointing to the hilum.

Herbs or shrubs. Leaves alternate, without stipules. Flowers axillary or terminal.

1. LOBELIA, Linn.

Calyx 5-cleft. Corol monopetalous, irregular, cleft on the upper side nearly to its base. Stamens united into a tube. Stigma 2-lobed. Capsule inferior or semisuperior, 2 or 3-celled, opening at the summit. Seeds minute, scabrons.

Pentandria. Monogynia.

1. L. dortmanna Linn.: leaves linear, 2-celled, fleshy, obtuse; scape nearly naked; flowers in a terminal raceme, remote, pcdicelled, nodding.—L. paludosa Nutt.

Hab. Ponds and swamps. Mass. to Geor. July. 21.—Scape 18 inches high. Leaves growing in a single tuft about the root, obtuse, spreading and recurved. Flowers 3 or 4, very remote, pendulous, pedicelled, pale blue. Water Gladiole.

2. L. kalmii Linn.: whole plant smooth; stem erect, branched; leaves linear, remotely toothed; radicle ones spathulate; racemes terminal, lax, few-flowered, leafy; peduncles longer than the fruit, with 2 minute bracts near the flower; capsule tapering at base.

HAB. Fields. N. S. July, Aug. 21.—Stem 12—20 inches high, slender. Flowers blue, on long peduncles.

3. L. nuttallii R. & S.: stem erect, minutely scabrous, simple, or with filiform branches; leaves oblong-linear, denticulate; flowers in slender racemes, distinct; peduncles coloured, shorter than the flower, with minute bracts near the base; capsule obtuse below.—L gracilis Nutt.—L. kalmii Bart. Ell.

- HAB. Margins of swamps. N. J. to Car. Aug. 3.—Stem filiform, erect, 2 feet high, often flexuous. Peduncles 1-4 inch long. Flowers pale blue, smaller than in the preceding : segments of the ealyx nearly double the length of the capsule.
- 4. L. claytoniana Mich.: stem ereet, simple, pubeseent; leaves oblong, pubescent, obtuse, nearly entire; radical ones spatulate; raceme virgate, naked; segments of the ealyx subulate, nearly as long as the tube of the eorol. - L. claytoniana and L. pallida Muhl.

Hab. Fields. Can. to Car. July, Aug. 21.—Stem 1 1-2—2 feet high, generally simple. Flowers pale blue, as large as those of L. kalmii, from 6-30 in a raceme. - I follow Dr. Torrey in uniting L. pallida of Muhl. with this species. They are, how ever, considered distinct by Mr. Elliott.

- 5. L. puberula Mich.: covered with silky down; stem erect, simple, slightly angled; leaves oblong-oval, obtuse, repand-serrulate; flowers nearly sessile, in a 1-sided spike; segments of the ealyx longer than the tube of the corol, ciliate; margins reflexed.
 - Hab. Mountains. Penn. to Geor. Sept. 21.—Stem 2 feet high.

 Lower leaves obovate; upper lanceolate. Flowers large, in a sccund-spike or raceme, nearly sessile, bright blue. - Allied to the next, but smaller in all its parts.
- 6. L. syphilitica Linn.: stem ereet, somewhat hairy; leaves elosely sessile, ovate-lanceolate, unequally serrate, with scattered hairs on the upper surface; raceme leafy, with the flowers on short pedicels; calyx hairy, with the margins reflexed.
 - HAB. Bogs, &c. Can. to Car. Sept. 24.-Stem 2-3 feet high, simple, hairy on the margin. Flowers on short pedicels, in a long leafy raceme, large, blue.
- 7. L. inflata Linn.: stem ereet, hairy, branched; leaves ovate-lanceolate, sessile, serrate, hairy; racemes leafy, somewhat paniculate; capsules inflated.
 - Han. Fields and woods. Can. to Car. W. to Miss. Aug.

 —Stem a foot high. Flowers numerous, small, pale blue, in leafy spikes or racemes .- Plant aerid and powerfully medicinal. Big. Med. Bot. i. 177. Indian Tobacco.
- 8. L. cardinalis Linn.: stem erect, simple, smooth; leaves oblonglanecolate, serrate; lower ones tapering at base; spike 1-sided, somewhat leafy, with the flowers on pubescent pedicels; stamens longer than the corol.
 - HAB. Low wet grounds. Can. to Car. July, Aug. 21.—Stem 1 1-2-2 feet high. Flowers very large, bright searlet, in a terminal raceme which is from 8-10 inches long.—One of the most spleudid plants in the Northern Section.

 Cardinal Flower.

ORDER LXX. ERICEÆ. Linn.

Calyx 4 or 5-cleft, nearly equal, inferior, persistent. Corol hypogynous, monopetalous, 4 or 5-cleft, occasionly separable into 4 or 5 pieces, regular or irregular. Stamens definite,

equal in number to the segments of the corol, or twice as many, hypogynous, or inserted into the base of the corol. Anthers 2-celled, the cells hard and dry. Ovary surrounded at the base by a disk or secreting scales, many-celled, many-seeded; style 1, straight; stigma 1, undivided or toothed. Fruit capsular, many-celled, with central placents. Seeds indefinite, minute; embryo cylindrical, in the axis of fleshy albumen; radicle opposite the hilum.

Shrubs or undershrubs. Leaves evergreen, rigid, entire, whorled or opposite, without stipules.

1. ARBUTUS. Linn.

Calyx minute, 5-parted. Corol ovate, diaphanous at the base; border small, 5-cleft, revolute. Stamens 10. Ber superior, 5-celled; cells 1, or many-seeded.

Decandria. Monogynia.

A. ura ursi Linn.: stem woody, procumbent; leaves petioled, cuneate-obovate, very entire, coriaceous; margin convex; flowers in a terminal clustered raceme; berries red, persistent, 5-seeded.—Arctostaphylos ura ursi Adans. Spreng.

HAB. On mountains. N. S. N. to Subarc. Amer. April, May. b.—A trailing evergreen. Flowers pale red. Berries scarlet.—The leaves are astringent and medicinal. Big. Med. Bot. i. 66.

Bear-berry.

2. GAULTHERIA. Linn.

Calyx 5-cleft or 5-toothed, bibracteate at base. Corol ovate; border partly 5-cleft, revolute. Stamens 10, with the filaments hirsute. Anthers two horned at the summit. Capsule superior, 5-celled, invested by the calyx which becomes a berry.

Decandria. Monogynia.

1. G. procumbens Linn.: stem procumbent, with the branches erect; leaves obovate, wedgeform at the base, ciliate-denticulate; flowers few, terminal, nodding.

Hab. Dry woods. N. S. May-July. 21.—Stem creeping; branches ascending, 4—6 inches high. Leares evergreen and shining. Flowers axillary, white. Fruit having the appearance of a bright scarlet berry.

Spicy Wintergreen.

2. G. hispidula Muhl.: stem filiform, creeping, hispid; leaves ovate, acute, with scattered hairs; flower solitary, axillary, subsessile, octandrous; corol small, bell-shaped.—G. scrpyllifolia Pursh.—Vaccinium hispidulum Linn.—Arbutus filiformis Lam.—Oxycoccus hispidulus Pers.

HAB. Alpine swamps. N. S. April, May. 5.—Stems creeping. Leaves evergreen, small, ovate or roundish oval. Flowers

solitary, on recurved peduncles. Calyx in 4 acute segments. Corol small, white, with as many segments as the calyx. Berry white. Taste of the leaves resembling that of G. procumbens.— There is some doubt with regard to the generic character of this plant. Dr. Torrey thinks it will constitute the type of a new genus.

3. ANDROMEDA. Linn.

Calyx 5-parted, minute, inferior. Corol ovate or subcylindrical, smooth; border 5-cleft, reflexed. Stamens 10. Capsule 5-celled, 5-valved; valves producing dissepiments from the middle; margins naked. Decandria. Monogynia.

* Leaves evergreen.

- 1. A. hypnoides Linn.: leaves imbricate, subulate, smooth; peduncles solitary, terminal, 1-flowered; eorol nodding, globose-campanulate.
 - Hab. White Hills, N. H. and N. W. Coast. June. P.—Shrub ereeping, resembling a moss; flowering branches erect. Flowers white, tinged with red.
- 2. A. polyfolia Linn.: leaves linear-lanceolate, convex, revolute, whitish-glaucous beneath; flowers in short terminal racemes.
 - HAB. Sphagnous swamps. N. S. N. to Are. Amer. June. b.

 —Stem a foot high. Leaves varying from linear to oblong.

 Flowers white, tinged with red.
- 3. A. calyculata Linn.: leaves lanceolate-oblong, rather obtuse, obsoletely serrulate, subrevolute, ferruginous beneath; raceines terminal, leafy, subsecund; pedicels short, solitary, axillary; ealyx bibracteate; corol oblong-cylindrical.
 - HAB. Swamps. Can. to Car. W. to Miss. April, May. 5.
 —A shrub 3-4 feet high. Leaves coriaceous, covered with white dots above, pale beneath. Flowers white, in terminal leafy racemes.

** Leaves deciduous.

4. A. mariana Linn.: leaves oval, somewhat acute, very entire, smooth, subcoriaceous, paler beneath; flowering branches nearly naked; pedicels fasciculate; ealyx leafy; corol ovate-cylindrie: anthers simple at the summit.

Hab. Sandy soils. N. J. to Flor. June, July. β.—Shrub 2—3 feet high. Flowers white and pale red, large. Anthers with two

minute awns at the base.

5. A. raccmosa Mich.: leaves oval-lanceolate, acute, serrulate, membranaceous, smooth above, somewhat pubeseent beneath: racemes terminal, secund, simple or branched; corol oblong-eylindrical, anthers 4-awned at the summit.—A. paniculata Walt.

HAB. Swamps and wet woods. Can. to Flor. June, July. h. -Shrub 4-6 feet high. Flowers white, in racemes which are 3 or 4 inches long. Corol contracted at the mouth. Anthers cleft, 4-awned.

6. A. arborea Linn.: branches terete; leaves oblong-oval, acuminate, sharply serrate, smooth; panicles terminal, many-spiked; corol

ovate-oblong, pubescent; anthers unawned, linear.

HAB. Mountains. Penn. to Flor. June, July. b .- A beautiful tree 40-50 feet high. Leaves large, shining above, paler beneath. Flowers white, in large terminal panicles consisting of numerous secund racemes or spikes. Sorrel Tree.

7. A. ligustrina Muhl.: pubescent; leaves obovate-lanceolate, acuminate, minutely serrulate; flower-bearing branches terminal, paniculate, naked; corol nearly globose, pubescent; anthers unawned. -A. paniculata Pursh .- Vaccinium ligustrinum Linn. not of Mich .- Lyonia vaniculata Nutt.

HAB. Swamps, &c. N. Y. to Car. June, July. b.-Shrub 4-6 feet high. *Flowers* white, in compound nearly naked and erect panicles. *Corol* small, white, pubescent.

4. CLETHRA. Linn.

Calyx 5-parted, persistent. Petals 5. Stamens 10. Style persistent. Stigma short and trifid. Capsule 3-celled, 3valved, enclosed by the calyx. Decandria. Monogynia.

C. alnifolia Linn.: leaves cuneate-obovate, acute, serrate, smooth, of the same colour on both sides; racemes spiked, simple, bracteate, hoary tomentose.

HAB. Swamps. N. Y. to Car. July, Aug. b. Shrub 3-6 feet high. Flowers white, in long terminal racemes or spikes, with downy pedicels. Sweet Pepper-bush.

5. MENZIESIA. Smith.

Calyx deeply 5-cleft. Corol ovate, 4-5-cleft. Stamens 8-10, inserted into the receptacle. Capsule 4-5-celled, dissepiments produced by the inflected margins of the valves. Seeds numerous, oblong. Octandria. Monogynia.

1. M. carulea Swartz: stem branched, woody below; leaves scattered, crowded, linear-toothed; peduncles terminal, aggregate, 1-flowered; flowers bell-shaped, 5-cleft, decandrous; calyx very acute.—Andromeda exrulea Linn .- Erica exrulea Willd.

HAB. White Hills, N. H. N. W. Coast and Labrador. July. 5. -An evergreen shrub resembling a heath in its foliage and flowers. Leaves one third of an inch long. Flowers large, purple, on long red peduncles.

2. M. globularis Salisb.: leaves lanceolate, glaucous beneath, except the nerves, pubescent; calyx 4-cleft; flowers globose, octandrous.-M. smithii Mich.

HAB. Mountains. Penn. to Car. June. 7.—Shrub 4 feet high. Leaves very hairy when young. Flowers yellowish-brown.

6. KALMIA. Linn.

Calyx 5-parted. Corol salver-form; border on the under side producing 10 cornute protuberances and as many cavities in which the anthers are concealed. Capsule 5-celled, many-seeded; dissepiments marginal.

Decandria. Monogynia.

1 K. glauca Ait.: branches ancipitous; leaves opposite, subsessile, oblong, smooth, glaucous beneath, revolute on the margin; corymbs terminal and axillary, bracteate; peduncles and ealyx very smooth.

b. rosmarinifolia Pursh: leaves linear, conspicuously revolute,

nearly green beneath.

II.as. Sphagnous swamps. N. S. N. to Arc. Amer. Junc, July.
 12.—Shrub 12—18 inches high, with opposite lanceolate leaves.
 Flowers pale rose coloured, in terminal corymbs or umbels. Var.
 b. is found in a swamp two miles east of this city.

Glaucous Kalmia.

2. K. angustifolia Linn.: leaves scattered or ternate, petiolate, oblong, obtuse, slightly ferruginous beneath; corymbs lateral-linear; peduncles and calyx glandular-pubescent.

HAB. Sandy woods. Can. to Car. June, July. D.—Shrub 12—18 inches high. Leaves entire, somewhat glaucous beneath. Flowers deep rose colour, in lateral corymbs, forming a kind of whorl around the stem. Sheep Laurel.

3. K. latifolia Linn.: leaves on long petioles, scattered and ternate, oval, coriaceous, green on both sides; corymbs terminal, viscidly pubescent.

Hab. Hills and mountains. N. Y. to Car. June, July. 5.—
Shrub 4—10 feet high, with large leaves and flowers, which are arranged in terminal corymbs. Corol rose coloured. Medicinal. Big. Med. Bot. i. 133. Mountain Laurel. Calico Bush.

7. EPIGÆA. Linn.

Calyx large, 5-parted, with 3 bracts at the base. Corol salver-form; border 5-parted, spreading; tube villous within. Stamens 10. Capsule 5-celled. Receptacle 5-parted.

Decandria. Monogynia.

E. repens Linn.: branches, nerves of the leaves and petioles very hairy; leaves on long petioles, cordate-ovate, very entire; corol subcylindrical.

IIAB. Side hills, roots of pines. Can. and N. S. April. b. —A small trailing and creeping evergreen. Flowers white, tinged with red, very fragrant. Ground Laurel.

8. RHODORA. Linn.

Calyx 5-toothed. Corol 3-petalled; petals unequal, slightly united at the base; the upper one thrice broader and 3-lobed, (or corol bilabiate; upper lip 2—3-cleft; lower one 2-toothed.) Stamens and style declinate. Capsule 5-celled, 5-valved, opening at the top; dissepiments formed of the inflexed margins of the valves.

Decandria. Monogynia.

R. canadensis Linn.

Hab. Mountain bogs. Can. and N. S. May. \$\tilde{\gamma}.\$-Shrub 2 feet high. Leaves alternate, oval, very entire, pubescent and glaucous beneath. Flowers purple, in terminal clusters or umbels, appearing before the leaves.

9. RHODODENDRON. Linn.

Calyx 5-parted. Corol somewhat funnel-form, 5-cleft. Stamens 5—10, declinate; anthers opening by 2 terminal pores. Capsule 5-celled, 5-valved, opening at the summit.

Decandria. Monogynia.

OBS: It was suggested by Pursh, that all the species of Azalea which he described, except A. procumbens, should be united with Rhododendron. This view has been adopted by Mr. Don and Dr. Torrey. These genera do not appear to differ at all, except in the number of stamens, which even in the true Azalea is liable to great variations.—See Don's remarks on Azalea, Rhododendron, Ledum and Leiophyllum in Edin. Phil. Jour. vi. 47.

* Stamens 5-10.

1. R. lapponicum Wahl.: leaves elliptical, roughened with excavated punctures; flowers in terminal leafy clusters, campanulate; stamens mostly 8.—Azalea lapponica Linn.

HAB. White Hills, N. H. Big. N. to Arc. Amer. July. 5.
—Shrub 8-10 inches high, with coriaceous evergreen leaves.

Flowers deep purple, in terminal clusters or umbels.

2. R. maximum Linn.: arborescent; leaves oblong, acute, paler beneath; umbels terminal; segments of the calyx oval, obtuse; corol campanulate.

Hab. Swamps and bogs. N. Y. to Car. June, July. 5.—
Shrub 10—15 feet high. Leaves large, coriaceous. Flowers rose
coloured, in a large compact cone-like raceme, covered when
young with large acuminate ferruginous bracts.—Several varieties occur in various parts of the U. S. Medicinal. Big. Med.
Bot. iii. 101.

American Rose Bay.

** Stamens 5.

3. R. nudiflorum Torr.: flowers rather naked; leaves lanceolate-oblong, nearly smooth and green on both sides; the midrib beneath brist-

ly; margin ciliate; flowers not viscous; tube longer than the divisions; teeth of the calyx short, somewhat rounded; stamens much exserted.

—Azalea nudiflora Linn.—A. periclymenoides Mich.

- Hab. Woods. Can. to Geor. April, May. 5.—Shrub 2—6 feet high. Flowers reddish, in terminal clustered racemes, appearing before the leaves.—Of this species there are a number of varieties. Among others mentioned by Pursh, is one which has from 10—20 stamens. Upright Honeysuckle. Pinxter Blom.
- 4. R. viscosum Torr.: flowers leafy; branches hispid; leaves oblong-oboyate, acute, smooth and green on both sides, ciliate on the margin; midrib bristly; flowers glutinous, hairy; tube as long again as the segments; teeth of the calyx short, rounded; stamens scarcely longer than the corol.—Azalca viscosa Linn. and A. glauca Pursh.

IIAB. Woods. Can. to Geor. June. p.—Shrub 6—8 feet high. Flowers white, in terminal clusters, sweet scented. Corol viscous and pubescent. A. glauca of Pursh appears to be only a

variety, with the leaves glaucous beneath.

5. R. calendulaceum Torr.: flowers rather naked; leaves oblong, pubescent on both sides, at length hirsute; flowers large, not viscous; teeth of the calyx oblong; tube of the corol hairy, shorter than the segments.—Azalea calendulacea Mich.—A. nudiflora var. coccinea Ait.

IIAB. Penn. to Car. May. \(\gamma\).—Shrub 2—6 feet high. Flowers yellow or flame colour.—Said to be the handsomest shrub in N.

America.

- 6. R. arborescens Torr.: flowers leafy; leaves obovate; somewhat obtuse, smooth on both sides, glaucous beneath, ciliate on the margin; nerve almost smooth; flowers not viscous; tube longer than the segments; calyx leafy, with the segments oblong, acute; filaments exserted.—Azalea arborescens Pursh.
 - HAB. Blue Mountains, Penn. May—July. ?. Pursh.—Shrub 10—20 feet high. Flowers large, reddish; scales of the flower-buds large, yellowish-brown, surrounded with a fringed white border. Pursh.
- 7. R. nitidum Torr.: flowers leafy; branches somewhat smooth; leaves oblanceolate, submucronate, coriaceous, smooth on both sides, shining above; nerve bristly beneath; margins revolute-ciliate; flowers viscous; tube a little longer than the segments; calyx very short.—Azalca nitida Pursh.
 - Hab. Mountain swamps. N. Y. to Vir. June, July. 5.— Leaves dark green and shining, smaller than in any other species. Flowers white, with a reddish tinge. Pursh.
- S. R. hispidum Torr.: flowers leafy; branches straight, very hispid; leaves long-lanceolate, hispid above, smooth beneath, glaucous on both sides; nerve bristly beneath; margin ciliate; flowers very viscous; tube scarcely longer than the segments; teeth of the calyx oblong, rounded; filaments exserted.—Azulea hispida Pursh.

HAB. Margins of lakes. Blue Mountains, Penn. July, Aug. 5.

—Shrub 10—15 feet high. Flowers white, with a red border.

Stamens often 10.—This shrub is said by Pursh to have a blueish appearance, by which it may be distinguished from all others at a great distance.

10. AZALEA. Linn. Don.

Calyx 5-parted. Corol short, campanulate, 5-cleft. Stamens 5, equal, shorter than the corol; anthers opening longitudinally. Style straight, included. Capsule 5-celled, 5-valved, opening at the top. Pentandria. Monogynia.

A. procumbens Linn.: stems diffusely procumbent; leaves opposite, elliptical, glabrous, revolute on the margin, included.—Loiseleuria procumbens R. & S.

Hab. High mountains. N. S. N. to Arc. Amer. July. 5. —Shrub 3—4 inches long, branched, leafless below. Flowers small, reddish, in small terminal umbels or corymbs.

11. LEDUM. Linn.

Calyx minute, 4-toothed. Corol 5-petalled, spreading. Stamens 5—10, exserted; anthers opening by two terminal pores. Capsule subovate, 5-celled, 5-valved, opening at the base, pedicellate. Seeds numerous, flat, linear, scabrous, with a membranaceous wing at each extremity.

Decandria. Monogynia.

1. L. latifolium Ait.: leaves oblong, replicate on the margin, ferruginous tomentose beneath; stamens 5, as long as the corol.—L. palustre var. latifolium Mich.

Hab. Sphagnous swamps. N. S. N. to Arc. Amer. June. 5.

—An evergreen shrub, with the stem irregularly branched; the branches woolly. Leaves alternate, broad-oblong, obtuse. Flowers large, in terminal corymbs, white.

Labrador Tea.

2. L. palustre Linn.: leaves linear, revolute on the margin, ferruginous tomentose beneath; stamens 10, longer than the corol.

Hab. Swamps. N. S. N. to Arc. Amer. June. 21.—A shrub smaller than the last and with narrower leaves.—I have found both species in a sphagnous swamp near Fairhaven, Vt.

ORDER LXXI. VACCINEE. De Cand. Lind.

Calyx superior, entire, or with from 4 to 6 lobes. Corol monopetalous, lobed as often as the calyx. Stamens distinct, double the number of the lobes of the corol, inserted into an epigynous disk; anthers with 2 horns and 2 cells. Ovary inferior, 4 or 5-celled, many-seeded; style simple; stigma simple. Berry crowned by the persistent limb of the calyx, succulent, 4 or 5-celled, many-seeded. Sceds minute; em-

bryo straight, in the axis of a fleshy albumen; cotyledons very short; radicle long, inferior.

Shrubs, with alternate coriaceous leaves.

1. VACCINIUM. Linn.

Calyx adherent, 4—5-toothed. Corol urceolate or campanulate, 4—5-cleft. Stamens 8—10. Filaments inserted on the germ. Berry globose, 4—5-celled, many-seeded.

Decandria. Monogynia.

* Leaves deciduous.

† Corol campanulate.

1. V. stamineum Linn.: much branched; the younger branches pubescent; leaves oval, acute, very entire, glaucous beneath; pedicels solitary, axillary, filiform, nodding; corol campanulate, spreading; segments oblong, acute; anthers exserted, awned, somewhat pyriform.—V. stumineum and V. album Pursh.

Hab. Dry woods. Can to Flor. May, June. b.—Shrub 2—3 feet high. Flowers white, on the lateral branches of the stem, which appear like leafy racemes. Berries large, greenish-white.

Deer-berry.

2. V. dumosum Curt,: younger branches, leaves and racemes sprinkled with resinous dots; leaves obovate, wedgeform at the base, mucronate, entire, (or finely serrulate,) green on both sides; racemes bracteate; pedicels short, axillary, subsolitary; corol campanulate; segments rounded; anthers included.—V. frondosum Mich.

HAB. Pine woods. N. J. to Flor. June. 5.—Shrub 12—18 inches high. Flowers large, white, nodding, in leafy racemes.

Berries large, globular, black and shining.

3. V. frondosum Linn.: leaves obovate-oblong, obtuse, very entire, sprinkled with resinous dots, glaucous beneath; racemes lateral, few-flowered, loose, bracteate; pedicels long, filiform; corol ovate-campanulate; anthers included.—V. glaucum Mich.

HAB. Sandy woods. Can. to Car. June. P.—Shrub 3—5 feet high. Raceme lateral, few-flowered. Flowers small, white. Berries large, bluish, sweet, ripening later had the other species.

Whortle-berry. Blue-tangles.

tt Corol urccolate.

a. Flowers racemose or fasciculate.

4. V. resinosum Ait.: leaves petiolate, oblong-oval, mostly obtuse, very entire, sprinkled with resinous dots beneath; racemes lateral, secund, bracteate; corol ovate, conic, pentangular, contracted at the mouth.

HAB. Woods and hills. Can. to Car. May, June. 5.—Shrub 2—4 feet high. Flowers reddish-green, in short lateral racemes or fascicles. Berries globular, black, sweet. Black Whortle-berry.

- 5. V. corymbosum Linn.: flower bearing branches almost leafless; leaves oblong-oval, acute at each extremity, nearly entire; the young ones pubescent; racemes short, sessile, bracteate; corol cylindrical-ovate—and V. fuscatum Ait. and V. amanum Pursh.—V. disomorphum. Mich.
 - HAB. Swamps and wet woods. Can. to Virg. June. b.—Shrub 4—8 feet high, with a few straggling branches. Flowers purplish-white, in racemes which are crowded near the summit of the naked branches. Berries large, black, subacid.

High Whortle-berry.

- 6. V. pennsylvanicum Lam.: branches angular, (green;) leaves sessile, ovate-lanceolate, mucronate, serrulate, shining on both surfaces; fascicles of flowers, subterminal; corol ovate.—V. virgatum Ait.?—V. tenellum Pursh.
 - Hab. Dry hills. N. Y. to Geor. May, June. 5.—Shrub 12—18 inches high, much branched. Flowers pale red, 6—8 in a fascicle. Calyx green. Berries large, blue and somewhat glaucous.

 Low Blue-berry.
- 7. V. tenellum Ait: racemes bracteate, sessile; corol ovate cylindrical; leaves oblong-elliptic, subcuniform, serrulate, nearly smooth.

HAB. N. J. and Penn. April. b. Muhl.

8. V. ligustrinum Mich.: branches angular and erect; leaves subsessile, erect, lanceolate, mucronate, serrulate; fascicles gemmaceous, sessile; flowers nearly sessile; corol oblong-ovate.

Hab. Dry woods. Penn. and Virg. May, June. 5.—A small shrub with straight and slender branches. Flowers purplish-red. Berries black.—It is said to vary very much in the shape and size of its leaves.

b. Flowers solitary.

9. V. uliginosum Linn.: procumbent; branches rigid; leaves obovate, very obtuse, entire, smooth above, veined and glaucous beneath; flowers subsolitary, octandrous; corol short, ovate, 4-cleft; anthers awned at the base.—V. uliginosum var. alpinum Big.

Hab. White Hills, N. H. N. to Arc. Amer. April, May. 5.

—A low procumbent shrub. Flowers single or in pairs, nearly sessile. Berries oblong, deep blue, crowned with the style.

**Leaves evergreen.

10. V. vitis idea Linn: stem creeping; branches erect; leaves obovate, evergreen, dotted beneath, subentire and revolute at the margin; flowers in terminal drooping racemes; corol oblong, campanulate.

HAB. High mountains. N. S. N. to Arc. Amer. May, June.
 J.—A low shrub, with a creeping stem and angular branches.
 Leaves small, coriaceous. Flowers few, in a raceme, pale red.
 Corol mostly 4-cleft, with 4 stamens. Berries red, acid.

Cow-berry.

2. OXYCOCCUS. Pers.

Calyx superior, 4-cleft. Corol 4-parted, with the segments somewhat linear and revolute. Stamens S. Filaments connivent; anthers tubular, 2-parted. Berry many-seeded.

Octandria. Monogynia.

- 1. O. macrocarpus Pursh: stem prostrate, filiform, creeping; leaves oblong, nearly flat, obtuse, with distant obsolete serratures, glaucous beneath; pedicels clongated, 1-flowered; segments of the corol linear-lanceolate.—O. rulgaris var. macrocarpus Pers.—Vaccinium oxycoccus var. oblongifolius Mich.
 - Hab. Sphagnous swamps. Can. and N. S. June. V.—Shrub creeping and throwing up short creet branches. Leaves alternate, small. Flowers white or pale red, on slender axillary pedicels. Berry large, bright scarlet.

 Common Cranberry.
- 2. O. palustris Pcrs.: stem filiform, creeping; leaves ovate, evergreen, entire, with revolute margins; peduncles 1-flowered, terminal; corol 4-parted; segments ovate.—O. vulgaris Pursh.—Vaccinium oxycoccus Linn.
 - Hab. Alpine bogs. Can. and N. S. June. 5.—A small evergreen creeping plant. Flowers red. Berries bright purple, smaller than the former.

ORDER LXXII. PYROLACEÆ. Lind.

Calyx 5-parted, persistent, inferior. Corol monopetalous, hypogynous, regular, deciduous, 4 or 5-toothed, with an imbricated æstivation. Stamens hypogynous, twice as numerous as the divisions of the corol; anthers 2-celled, opening longitudinally, and furnished with appendages at the base. Ovary superior, 4 or 5-celled, many-seeded, with a hypogynous disk; style 1, straight or declinate; stigma simple. Fruit capsular, 4 or 5-celled, dehiscent, with central placentæ. Seeds indefinite, minute, winged; embryo minute, inserted at the extremity of a fleshy albumen.

Herbs, rarely undershrubs, sometimes parasitical and leafless. Leaves either wanting or simple. Flowers solitary, or in terminal racemes.

1. PYROLA. Linn.

Calyx minute, 5-cleft or 5-parted. Petals 5. Stamens 10, slightly united at base. Anthers opening by 2 pores at base. Stigma 5-lobed. Capsule 5-celled. Placenta lunate. Seeds invested with a long aril. Decandria. Monogynia.

Obs. In the arrangement and description of our species of Pyrola, I have mainly adopted the views expressed by Mr. Don in his valuable monograph of this genus.—Wernerian Transactions, v. 220.

- * Valves of the capsules with their margins connected by an intricate fine tomentum, dehiscent at the base. Leaves alternate. Flowers in racemes.
- † Stamens ascending. Style declinate, longer than the petals. Stigma annulate.
- 1. P. rotundifolia Linn.: leaves roundish, very entire or crenulate, coriaceous, shorter than the dilated petiole; scape triquetrous; segments of the calyx lanceolate, acute; stigma clavate, obtusely 5-toothed.
 - HAB. Woods. Can. to Car. July. 2f.—Leaves all radical, evergreen, sometimes scarcely half the length of the petioles. Scape a foot or more high. Flowers cernuous, white, in an erect elongated raceme, emitting a fragrant smell.—The largest of the whole genus.

 Round-leaved Wintergreen.
- 2. P. asarifolia Mich.: leaves reniform, coriaceous, repandly crenate, half as long as the dilated petiole; scape acutely triquetrous; raceme many-flowered; segments of the calyx ovate, acuminate, appressed; stigma clavate, with the disk elongated and 5-lobed.
 - HAB. Dry woods. Can and N. S. 21.—Mr. Don considers this to be entirely distinct from the next, with which it is confounded by Mr. Nuttall.—"The leaves," he observes, "appear to be subject to some slight variations; but in the true state they are of a reniform shape, nearly about the size and form of those of Asarum europeum: this remarkable character, if constant, would alone have been sufficient to distinguish it from every other species. The plant itself, is about the size of P. rotundifolia, which it greatly resembles in the figure and disposition of its flowers, which are of a greenish-white colour."
- 3. P. chlorantha Swartz: leaves orbicular, retuse, obsoletely crenulate, half as long as the narrow petiole; raceme few-flowered; segments of the calyx very short, obtuse; petals oblong; pores of the anthers tubular; stigma clavate, with the disk elongated and 5-lobed.—P. rotundifolia var. mummularia Muhl. Cat.

HAB. Woods. Can. and N. S. 21.

- 4. P. elliptica Nutt.: leaves elliptic or ovate, membranaceous, serrulate, longer than the dilated petiole; raceme few-flowered; bracts lanceolate-subulate, recurved at the summit; segments of the calyx very short, with recurved points; petals oval; stigma clavate, with the disk elongated and 5-lobed.
 - HAB. Dry woods. Can. and N. S. July, Aug. 21.—Leaves membranaccous, finely serrate, oblong-oval, sometimes ovate, with an attenuated base, much longer than the petiole. Raceme few-flowered. Flowers white, odorous.—Allied to P. rotundifolia, but is smaller.
 - †† Stamens creet. Style straight. Stigma not annulate.
 - 5. P. minor Linn.: leaves roundish or oval, coriaceous, repandly-

crenate, longer than the dilated petiole; racemes spiked, with bracts much longer than the pedicels; segments of the ealyx very short;

style included; stigma nearly flat, 5-lobed.

- HAB. N. Y. and Penn. Pursh & Muhl. N. to Are. Amer. June. 2(...-Resembles P. medin, from which, however, it is distinguished by its straight style, equal to the length of the stamens, and shorter than the petals; by its spiked and closer raceme, by the pedicels being shorter than the bracts, and the petioles shorter than the leaves, &c. Don credits this species only to Northern Europe and Asia, and Sprengel unites the P. minor of Pursh with P. chlorantha of Swartz.—But it cannot be mistaken for the latter species.
- 6. P. secunda Linn.: leaves ovate, acute, membranaceous, sharply serrate, longer than the narrow petiole; raceme secund; segments of the calyx rounded; petals oblong; style exserted; stigma nearly flat, 5-lobed.
 - Hab. Sandy woods. Can. and N. S. 5.—Stem 2—3 inches high. Flowers greenish-white, in a one-sided raceme.
- ** Valves of the capsules with their margins unconnected by tomentum, opening from the top. Leaves in threes or verticillate. Flowers solitary, in corymbs or umbels.
- 7. P. uniflora Linn.: flower solitary; leaves orbicular, serrate; pores of the anthers elongated-tubular; stigma acute; style straight, 5-toothed.
 - HAB. Can. and N. S. rare. July. 21.—A small and very delicate species. Flower terminal, large, white, fragrant, nodding.
- 8. P. umbellata Linn.: leaves cuncate-lanceolate, serrate, in fours or sixes; pedunele pubescent, corymbed; bracts linear-subulate; appendages of the filaments ciliate; style immersed in the germ.—Chimaphita corymbosa Pursh.
 - Hab. Woods. Can, and N. S. July. 21.—Root woody and creeping. Stem ascending, somewhat woody. Leaves evergreen, smooth and coriaceous, lower surface somewhat paler. Scape or peduncle 4—6 inches high. Flowers large, greenishwhite tinged with purple, in a terminal corymb or imperfect umbel, on nodding pedicels.—It is known by the Indians by the name of Pipsissawa or Sipsisewa. Medicinal. See Big. Mcd. Bot. ii. 15.
- 9. P. maculata Linn.: leaves lanceolate, acuminate, incisely serrate, discoloured, opposite or in threes; peduncles pubescent, corymbed; bracts linear; appendages of the filaments woolly; style very short.—Chimaphila maculata Pursh.
 - Hab. Sandy woods. Can to Car. July. 24.—This species may be distinguished by its varigated leaves. Stem 3—4 inches high. Flowers large, reddish-white, nodding, fragrant, 2 or 3 in a corymb or umbel.

 Spotted Wintergreen.

2. MONOTROPA. Linn.

Calyx 4-5-parted, or none. Corol 5-petalled, cucullate

at base. Anthers 2-celled, with two obtuse horns at their base. (Don.) Capsule 5-celled, 5-valved. Seeds numerous, surrounded by a membrane. Decandria. Monogynia.

* Scape many-flowcred. Hypopithys. Nutt.

1. M. lanuginosa Mich.: scape bearing the flowers in a spike; bracts

and flowers woolly .- Hypopithys lanuginosa Nutt.

Hab. Roots of trees. Can. to Car. Aug. 21.—Scape 4—6 inches long. Leaves merely scales, lanceolate, obtuse, crowded at base and a little hairy. Flowers white, in a terminal spike, on short peduncles.—Whole plant of a clear white, turning black by decay or by drying.

Tobacco-pipe.

2. M. hypopithys Linn.: scape bearing the flowers in a spike; scales and flowers smooth externally; lateral flowers with 8 stamens.—Hy-

popithys europea Nutt.

- Hab. Roots of trees. Can. Penn. and N. Car. June, July. 24.

 —The whole plant is of a brownish-yellow colour. There is still some doubt whether this is a plant of the Northern States; what has been called by that name here being merely a smooth variety of the preceding. According to Sprengel, the Monotropsis odorata of Elliott is identical with this species.
 - ** Scape 1-flowcred. Monotropa. Nutt.
- 3. M. uniflora Linn.: scape straight, elongated, 1-flowered; flowers with 10 stamens, erect, or cernuous.
 - HAB. Shady woods. June. 21.—Scape 5—8 inches. Flowers large, mostly nodding, but sometimes creet. Whole plant white.

3. PTEROSPORA. Nutt.

Calyx 5-parted. Corol monopetalous, ovate; margin 5-toothed, reflexed. Anthers excentrically peltate, 2-celled, adnate to the filaments by the margin, bisetose. Capsule 5-celled, imperfectly 5-valved; dissepiments from the middle of the valves; septa and valves uniting towards the base, and coalescing with the receptacular axis; receptacle 5-lobed: Seeds very numerous and minute, each furnished with a terminal wing.

Decandria. Monogynia.

P. andromeda Nutt.

HAB. Clay soils. Can. Banks of the Seneca Lake. Gray; and near Λlbany, N.Y. July. .—Plant covered with brownish viscid hairs. Stem 1 1-2—2 feet high, simple, brownish-red or purple, clothed at base with lanceolate bracts. Flowers very numerous, irregularly disposed in a long terminal raceme, red and white. Peduncles filiform, nodding, longer than the flowers.

SUBCLASS III. COROLLIFLORE.

Petals united in the form of a hypogynous corol, which is not attached to the calyx. Stamens inserted into the corol.

ORDER LXXIII. EBENACEÆ. Vent. Lind.

Flowers polygamous or dioecious, rarely perfect. Calyx 3—6-divided, nearly equal, persistent. Corol monopetalous, regular, deciduous, somewhat coriaceous, 3—6-divided; æstivation imbricated. Stamens inserted on the corol, or hypogynous, definite; filaments usually in two rows; anthers ereet, linear-lanecolate, 2-celled, bursting longitudinally. Ovary free, sessile, many-celled; ovules 1 or 2 in each cell, pendulous; style divided, rarely simple; stigmas simple or bifid. Fruit fleshy, round or oval, the pericarp sometimes opening regularly. Seeds few, with a membranous coat; embryo straight; albumen cartilaginous; radicle next the hilum; cotyledons foliaceous.

Trees or shrubs, without milky juice. Leaves coriaceous, alternate, without stipules.

1. DIOSPYROS. Linn.

Dioecious. Calyx 4—6-cleft. Corol urceolate, 4—6-cleft. Sterile Fl. Stamens 8—16, often producing 2 anthers. Fertile Fl. Style 1. Stigmas 4—5. Berry 8—12-celled. Dioecia. Octandria.

D. virginiana Linn.: leaves ovate-oblong, acuminate, reticulately veined, nearly smooth; petioles pubescent; buds smooth.

Hab. Woods. Penn. to Geor. and throughout the Western States. May. 5.—A small tree, seldom more than 30—40 feet high. Leaces alternate. Flowers solitary, axillary, on short peduncles, greenish-yellow. Fruit as large as a common plum, golden-yellow, well flavored when fully ripe, but very astringent before that time. Persimmon.

ORDER LXXIV. ILICINEÆ. Lind.

Sepals 4—6; estivation imbricated. Corol monopetalous, 4—5-parted, hypogynous; estivation imbricated. Stamens inserted into the corol, alternate with its segments; filaments ereet; anthers adnate. Disk none. Ovary fleshy, superior, somewhat truncate, 2—6-celled; ovules solitary, pendulous from a cup-shaped funiculus; stigma subsessile, lobed. Fruit fleshy, indehiscent, with from 2 to 6 stones. Seed suspended, nearly sessile; albumen large, fleshy; embryo small, 2-lobed, lying next the hilum, with minute cotyledons and a superior radicle.

Trees or shrubs. Leaves alternate or opposite, coriaceous.

1. ILEX. Linn.

Calyx 4-5-toothed, persistent. Corol 4-5-parted. Stamens 4-5, alternating with the petals. Ovary sessile, 4celled. Stigmas subsessile, 4-5, sometimes distinct, sometimes united. Berry 4-5-seeded.

Tetrandria. Tetragynia.

I. opaca Ait.: leaves ovate, flat, coriaceous, acute, smooth, their margins with sharp spines; flowers scattered at the base of the young-

er branches; teeth of the calyx acute.- I. aquifolium Walt.

HAB. Sandy woods. Can. to Car. W. to Arkansas. June b. -An evergreen tree 10-15 feet high. Leaves tough, smooth and shining, with rigid spines at the edges. Flowers growing in bunches around the branches, small, white.-It is stated by the younger Michaux, that birdlime may be extracted from the bark. The wood is fine grained and compact, and is employed by cabinet makers and turners. American Holly.

2. NEMOPANTHES. Raf.

Flowers by abortion dioecious or polygamous. small, scarcely conspicuous. Petals 5, distinct, oblong-linear, deciduous. Stamens 5, alternating with the petals. Ovary hemispheric. Style none. Stigmas 3-4, sessile. subglobose, 3-4-celled, 3-4-seeded.

Pentandria. Tetragynia.

N. canadensis De Cand. : leaves deciduous, ovate-oblong, very entire, smooth, mucronate; peduncles subsolitary (or fasciculate) very long, 1-flowered; fruit obtusely quadrangular. -N. fascicularis Ref. - flex canadensis Mich.

HAB. Mountains. Can. to Car. May, June. h .- A shrub 3-6 feet high. Leaves smooth, oval, entire or slightly toothed. Flowers small, green, on long slender peduncles. Berrics deep red.

Canadian Holly.

3. PRINOS. Linn.

Characters same as Ilex, but the flowers are often by abortion dioecious or polygamous, 6-cleft, 6-stamened, and the Hexandria. Monogynia. berry 6-seeded.

1. P. verticillatus Linn.: stem much branched; leaves deciduous, oval, serrate, acuminate, pubescent beneath; flowers dioecious, 6-cleft; sterile ones axillary, subumbellate; fertile ones aggregated; berries globose.-P. gronovii Mich.

b. dubius De Cand.: flowers 4-5-cleft.-P. ambiguus Pursh.-P.

verticillatus var. tenuifolius Torr.?

HAB. Swamps. Can. to Car. June, July. 5.—Shrub 6—8 feet high. Flowers small, white. Berries bright scarlet.

Winter Berry.

2. P. ambiguus Mich.: leaves deciduous, oval, entire, acuminate at each end; flowers 4-cleft; sterile ones crowded on the lower branchlets; fertile ones solitary, on long peduncles.

II ar. Wet woods, Penn. to Geor. ? July. 5.—A small tree, with whitish bark. Leaves 1 1-2 inch long, and 1 inch wide,

petiolate.

3. P. lævigatus Pursh: leaves deciduous, lanceolate, with appressed serratures, smooth; on both sides, shining above; nerves beneath scarcely pubescent; flowers 6-cleft; fertile ones axillary, subsessile; sterile scattered, pedunculate.

11 A.B. In swamps. N. S. W. to Miss. July. 5.—A shrub 6—8 feet high. Leaves 2 1-2 inches long. Berries large, red.

4. P. gluber Linn.: leaves evergreen, wedge-form, lanceolate, coriaceous, smooth and shining, somewhat toothed at the extremity; pedicels axillary, subsolitary, mostly 3-flowered.

11 vs. Swamps. N. Y. to Car. July. 5.—Shrub 3—4 feet high. Flowers white. Berries globose, black and shining. Ink Berry.

ORDER LXXV. OLEACEÆ. Lind.

Flowers monoclinous, sometimes dioecious. Calyx monophyllous, divided, persistent. Corol hypogynous, monopetalous, 4-cleft, sometimes of 4 petals, connected in pairs by the intervention of the filaments, rarely wanting; æstivation somewhat valvate. Stamens 2, alternate with the segments of the corol; anthers 2-celled, bursting longitudinally. Ovary free, 2-celled; ovules in pairs, collateral, pendulous; style 1, or none; stigma entire or bifid. Fruit drupaceous, baccate or capsular. Seeds often by abortion solitary; albumen dense, fleshy, abundant; embryo straight, about half the length of the albumen; radicle superior; cotyledons foliaceous.

Trees or shrubs. Leaves opposite, simple, sometimes pinnatifid.

1. LIGUSTRUM. Linn.

Calyx minute, 4-toothed. Corol with the tube short; the limb 4-cleft, spreading. Stamens 2. Berry 1-celled, 2—4-seeded. Diandria. Monogynia.

L. vulgare Linn.: leaves elliptical-lanceolate, somewhat acute, smooth; panicle terminal, compact.

Hab. Woods. N. Y. to Virg. W. to Miss. May, June. 7.

—Shrub 4—6 feet high. Leaves dark green, opposite, entire, with a small point. Flowers white, in dense terminal panicles.

Berries purplish-black. Privet or Prim.

2. CHIONANTHUS. Linn.

Calyx 4-parted. Corol deeply 4-parted; segments long and linear. Stamens 2; anthers nearly sessile, on the tube. Drupe 1-seeded. Nut striate. Diandria. Monogynia.

C. virginica Liun.: panicle terminal; peduncles 3-flowered; leaves acute.

 a. montana Pursh: leaves oval-lanceolate, coriaceous, smooth; panicles dense; drupe oval.

b. maritima Pursh: leaves obovate-lanceolate, membranaceous, pu-

bescent; panicles very loose; drupe elliptical.

Hab. a. on mountains; b. on the sea coast. Penn. to Car. May, June. b.—A small tree, 6—10 feet high, with opposite branches. Flowers white, in pendulous panicles. Drupe purple. The covol is sometimes 5 or 6-cleft. Fringe Tree.

3. FRAXINUS. Linu.

Calyx none, or 3—4-cleft. Corol none or deeply 4-parted, Stamens 2. Capsule 2-celled, 2-seeded, compressed and foliaceous at the extremity. Seed solitary, pendulous.—Polygamous.

Dioecia. Diandria.

* Flowers naked, never perfect. Authors sessile.

1. F. sambueifolia Willd.: leaves pinnate; leafets sessile, ovate-lanceolate, rugose and shining, rounded and unequal at base; axils of the veins villous beneath; flowers naked.

Hab. River banks. Can. and N. S. April. 5.—A large tree, with the buds deep blue; young shoots dotted, green. Leafets in 5 pairs.

Black Ash. Water Ash.

** Flowers ealyeulate, apetalous.

2. F. acuminata Lam: leaves pinnate; leafets petiolate, oblong, shining, acuminate, very entire or slightly toothed, glaucous beneath; flowers calyculate.—F. antericana Willd.—F. concolor Mich. f.

Hab. Woods. Can. to Car. May. 5.—A large tree 50—60 feet high. Leaves at first downy, at length green above and white beneath. Leafets in 3—4 pairs.—The wood is valuable in many of the arts.

White Ash.

3. F. pubesceus Walt.: leaves pinnate; leafets petiolate, elliptical-ovate, serrate; the under surface, petioles and young branches tomentose; flowers calyculate.—F. tomentosa Mich. f.

Hab. Woods. Can to Car. April, May. 5.—A large tree. Leafets in 3—4 pairs, acuminate, with a long summit, often nearly entire, very long.

Red Ash.

4. F. juglandifolia Lam.: leaves pinnate; leafets petiolate, ovate, opake, serrate, glaucous beneath; axils of the veins pubescent; branches smooth; flowers calyculate.

IIAB. Wet woods. Can. to Car. May. h.-A small tree. Legfets in 3 pairs. Swamp Ash.

- *** Flowers calyculate, 4-petalled. Anthers pedicellate. Ornus. Pers.
- 5. F. ornus Linn. : ? leaves pinnate; leafets broad-ovate, serrate, the terminal one obcordate .- Ornus curopea var. americana Pers .- O. americana Pursh.
 - HAB. Shady woods. Md. and Virg.; rare. May. b. Pursh. -A tree with opposite and unequally pinnate leaves. Flowers in panicles resembling those of Chionanthus. Fruit small and winged.—A very obscure plant, concerning which so little is known, that it is impossible to determine whether it is distinct from the foreign F. ornus, or a mere variety. It is certain, however, that the genus Ornus of Persoon is not sufficiently distinct from Fraxinus. Flowering Ash.

ORDER LXXVI. APOCYNEÆ. Juss. Lind.

Calyx divided in 5, persistent. Corol monopetalous, hypogynous, regular, 5-lobed, deciduous; æstivation contortedimbricate. Stamens 5, inserted on the corol, alternate with its lobes; filaments distinct; anthers 2-celled, bursting longitudinally; pollen granular, globose, or 3-lobed, immediately applied to the stigma. Ovaries 2, or 1-2-celled, manyseeded; styles 2 or 1; stigma 1. Fruit a follicle, capsule, or drupe or berry, double or single. Seeds indefinite or rarely definite; albumen fleshy, cartilaginous, or horny, rarely wanting; embryo foliaceous; radicle turned to the hilum.

Plants with usually a milky juice. Leaves entire, general-

ly opposite.

APOCYNUM. Linn.

Calyx very small, 5-cleft, persistent. Corol campanulate; border with 5 short spreading or revolute lobes; the base furnished with 5 glandular teeth alternating with the stamens. Stamens 5, included. Anthers sagittate, connivent, cohering to the stigma by the middle. Ovaries 2; style obsolete; stigmas dilated, conic at the apex. Follicles long, distinct.

Pentandria. Digynia.

1. A. androsamifolium Linn.: leaves ovate, smooth onboth sides; cymes lateral and terminal, smooth; tube of the corol longer than the calyx.

20*

- Hab. Fields, &c. Subarc. Amer. to Car. June, July. 21.—
 Stem 3—5 feet high, erect, with spreading branches. Flowers
 pale red, with the border spreading. Medicinal. Big. Med. Bot. ii. 148.
- 2. A. cannabinum Linn. : leaves on short petioles, lanceolate, acute at each end, smooth on both sides; cymes paniculate; calyx as long as the tube of the corol.
 - Hab. Fields and woods. Can. to Car. W. to Miss. June, July. 21.—Stem erect, branched. Flowers small, greenish-white, in terminal cymes.—Has the leaves narrower and the flowers smaller than in the preceding. Indian Hemp.
- 3. A. hypericifolium Ait.: leaves oblong, smooth, on very short petioles, mucronate, obtuse and subcordate at base; cymes shorter than the leaves; calyx nearly as long as the tube of the corol.

HAB. Gravelly banks of streams. N. S. June, July. 21.-Stem 2 feet high, erect. Flowers small, greenish-white.-Plant small-

er than the former.

4. A. pubescens Brown: leaves on short petioles, ovate-oblong, mucronate, hoary-pubescent beneath; cymes short, pubescent; corol longer than the calyx .- A. cannabinum Mich. Pursh.

Hab. Fields. N. S. June, July. 2f.—Stem 2-3 feet high. Flowers small, greenish-white.—Can be distinguished by the

pubescence of its leaves and cymes.

ORDER LXXVII. ASCLEPIADEÆ. Brown.

Calyx 5-divided, persistent. Corol hypogynous, monopetalous, 5-lobed, regular deciduous; æstivation contortedimbricate, rarely valvate. Stamens 5, inserted into the base of the corol, and alternate with its segments; filaments usually connate; anthers 2-celled, each cell sometimes divided by incomplete septa; pollen, when the anther bursts, coalescing into masses which are as numerous as the cells, or sometimes confluent by pairs, and sticking to the 5 processes of the stigma, either by twos, by fours, or singly. Ovaries 2: ovules indefinite; styles 2, close to each other, often very short: stigma 1, common to both styles, dilated, with 5 corpusculiferous angles. Placenta attached to the suture, at length separating. Follicles 2, 1 of which is sometimes abortive. Seeds indefinite, imbricate, pendulous, usually with a coma at the hilum; albumen thin; embryo straight; radicle superior: cotyledons foliaceous.

Plants, with usually a milky juice, often twining. Leaves entire, usually opposite, with interpetiolar ciliæ, instead of sti-

pules.

1. ASCLEPIAS. Linn.

Calyx small, 5-parted. Corol 5-parted, reflexed. Stamineal crown (nectary) 5-leaved; leafets opposite the anthers, each producing from its base a subulate averted process. Stigma with 5-angles, opening by longitudinal chinks, depressed. Pollinia 5 distinct pairs. Follicles 2, ventricose, smooth or muricate. Seeds comose. Pentandria. Digynia.

* Leaves opposite. Neetaries with horns.

1. A. syriaca Linn.: stem simple; leaves oblong-lanceolate, petiolate, tomentose beneath; umbel subterminal, many-flowered, nodding; flowers large; nectary 2-toothed; follicles muricate.

HAB. Fields and road sides. N. S. W. to Miss. July, Aug. 21.—Stem 2-4 feet high. Umbels lateral and terminal, 15-20

flowered. Flowers large, pale purple. Nectaries red.

Common Milk-weed.

- 2. A. phytolaecoides Pursh: stem erect, simple; leaves broad-lanceolate, acuminate, smooth, pale beneath; umbels many-flowered, lateral and terminal, solitary, on long peduncles, nodding; nectary 2toothed.—A. exaltata and acuminata Muhl.
 - HAB. Wet rocky grounds. Can. to Car. W. to Miss. June, July. 24.—Stem 3-4 feet high. Leaves large. Umbels few-flowered, on long peduncles. Flowers large, greenish-purple.—A more delicate species than the preceding.
- 3. A. debilis Mich.: smooth; stem erect, weak, simple; leaves petioled, oval-lanceolate, acute at each end, membranaceous; umbels terminal, loose; pedicels capillary.—A. parviflora Linn.?

HAB. Rocks near streams. N. Y. to Car. July, Aug. 21.— Leaves large. Flowers white. Pursh.

4. A. inearnata Linn.: stem erect, tomentose, branched above; leaves lanceolate, subsessile, somewhat tomentose; umbels erect, mostly in pairs; nectary entire; horns subulate, exserted.

b. pulchra Pers.: stem and leaves very hairy.—A. pulchra Willd.

Hab. Banks of streams. Can. to Car. W. to Miss. July, Aug.

21.—Stem 2—4 feet high. Umbels numerous, generally in pairs.

Flowers pale purple. Var. b. differs only in its pubescence.

5. A. amana Linn.: stem erect, branched above, with 2 longitudinal pubescent lines; leaves subsessile, oblong-oval, acute, pubescent beneath; umbels terminal, erect, many-flowered; nectary entire; horn subulate, exserted.

Hab. Swamps and wet grounds. N. S. July, Aug. 21.—Stem 3 feet high. Umbels many-flowered. Flowers purple.

6. A. purpuraseens Linn.: stem erect, nearly simple; leaves ovate, subsessile, nearly smooth above, white, downy beneath, with the midrib broad and purple; umbels erect; horns of the nectary resupinate.

HAB. Near Boston. Big. July. 21 .- Stem 3-4 feet high.

Umbels terminal, on short peduncles. Flowers dark purple, about the size of A. syriaca.—Well defined by the peculiar curvature of the horn.

7. A. obtusifolia Mich.: stem simple, erect; leaves closely sessile or clasping, oblong-obtuse, undulate on the margin, very smooth, glaucous beneath; umbel terminal, long peduncled, generally solitary; nectary slightly 2-toothed; horns exserted.—A. purpurascens Walt.

Hab. Sandy fields. N. Y. to Car. June. 21.—Stem 2—3 feet high, erect, simple, very smooth. Umbels 1—3, terminal, on long peduncles. Leaves much waved on the margin. Flowers

large, pale purple.

8. A. variegata Linn.: stem simple, erect; leaves ovate, petiolate, smooth, somewhat glaucous beneath; umbels lateral and terminal, on short peduncles, crowded; pedicels tomentose; horn broad-falcate.—
A. hybrida Mich.

HAB. Woods. N. Y. to Car. July, Aug. 24.—Stem 3—4 feet high, pubescent above. Leaves slightly acuminate, on pubescent petioles. Umbels 2—6, densely flowered. Flowers white.

- 9. A. acuminata Fursh: stem erect, very smooth, simple; leaves ovate, subcordate, acuminate, subsessile; umbels lateral, solitary, erect; nectary acute; horns scarcely exserted.—A. periplocafolia Nutt.—A. cordata Walt.
 - Hab. Sandy swamps. N. J. to Car. Aug. 24.—Root large and tuberous. Stem 18 inches high. Leaves smooth on both sides. Umbels about 2, dense. Flowers purple and green.
- 10. A. laurifolia Mich.: stem erect, smooth; leaves nearly sessile, oval-lanceolate, tapering at the summit, very acute, smooth, margins somewhat rough; umbels on long peduncles, terminal and axillary.
 - Hab. Penn. Muhl. Aug. 21.—Stem 2 feet high, pubescent near the top. Leaves sessile, obtuse at base. Umbels few, near the summit. Corol 3 or 4 times as the long as calyx, green and purple.
- 11. A. quadrifolia Jacq.: stem erect, simple, smooth; leaves in fours, ovate, acuminate, membranaceous, petiolate, smooth; umbels 2, terminal, erect, loose; pedicels capillary; nectary 2-toothed; horn very short.

Hab. Stony woods. Can. to Car. W. to Miss. June. 24.—
Stem 1—2 feet high, slender, pubescent towards the top. Leaves
in fours; the upper and lower ones often opposite. Umbels few,

on long peduncles. Flowers small, white.

12. A. verticillata Linn.: stem simple, marked with pubescent lines; leaves mostly whorled, narrow-linear, revolute; nectaries short, bidentate; horns falcate, much exserted.

Hab. Dry hills. N. Y. to Car. W. to Miss. June, July. 21.—Stem 3 feet high, very slender. Leaves generally in whorls of 5 or 6, 2—3 inches long, very narrow. Umbels numerous. Flowers small, yellowish-white.

** Leaves opposite. Nectary without horns. Acerates.

13. A. viridiflora Raf.: stem erect, simple, hairy; leaves oblong, on short petioles; tomentose-pubescent on both sides, obtuse; umbels lateral, solitary, subsessile, nodding, dense; pedicels tomentose; horns of the nectary wanting.—A. vutans Muhl.

b. obovata Torr.: leaves obovate. - A. obovata Ell.

Hab. Sandy fields. N. S. W. to Miss. July. 21.—Stem 2 feet high, very pubcscent. Leaves thick, nearly sessile, varying in in form. Umbels about 3, on long peduncles. Flowers green.

14. A. lanccolata Iccs: stem decumbent, hirsute; leaves opposite, lanceolate, acute, subsessile, hirsute; umbels lateral, solitary, sessile, nodding, subglobose, dense flowered; horn of the nectary wanting.—
A. viridiflora var. lanccolata Torr.

HAB. Near New Haven, Conn. Iccs. July. 21.—Certainly dis-

tinct from the preceding.

*** Leaves alternate.

15. A. tuberosa Linn.: stem erect, hairy, with spreading branches; leaves oblong-lanceolate, sessile, alternate, somewhat crowded; um-

bels numerous, forming terminal corymbs.

HAB. Sandy fields. Can. to Car. W. to Miss. July, Aug. 21.—Root large, tuberous. Stem 2—3 feet high, with spreading branches above. Flowers large, in numerous erect umbels, bright orange. Medicinal. Big. Med. Bot. ii. 59.

Pleurisy Root.

2. GONOLOBUS. Mich.

Corol rotate, 5-parted. Stamineal crown scutelliform, lobed. Anthers opening transversely, terminated by a membrane. Pollinia 5 pairs, not separating into grains. Stigma flattish-depressed. Follicles 2, ventricose. Seeds comose.

Pentandria. Digynia.

1. G. obliques Brown: stem climbing, hairy; leaves ovate-cordate, villous, acute; corymbs axillary; segments of the eorol ovate, aeuminate, oblique, revolute; calyx small.—Cynanchum obliquem Muhl.

Hab. Near Philadelphia, Penn. Bart. July. 21.—Stem 4—5 feet long. Leares veined on both sides. Umbels axillary, much shorter than the leaves. Flowers fetid, dark purple.

2. G. hirsutus Nich.: stem twining; younger branches very hairy; leaves cordate-oval, acuminate, pubescent on both sides; segments of the eorol linear-oblong; follicles oblong, murieate.—Gonolobium hirsutum Pursh.

HAB. Hedges near streams. Penn. to Car. Pursh. June, July. 21.—Stem trailing and climbing, 3—4 feet long, pubescent. Leaves slightly auriculate at base. Umbels axillary, 3—4-flowered. Flowers dark purple.

3. PERIPLOCA. Linn.

Calyx 5-cleft. Corol rotate, flat, 5-parted; orifice surrounded with an urceolate 5-cleft crown, terminating in 5 filiform awns. Filaments distinct. Anthers cohering, bearded on the back. Pollinia dilated at the apex and united to the corpuscules of the stigma, solitary, composed of 4 confluent grains. Follicles 2, smooth, divaricate. Seeds comose.

Pentandria. Digynia.

P. græca Linn.: climbing; leaves opposite, ovate, acuminate; flowers hairy within, and terminal.

Hab. Western part of N. Y. Aug. b.—Shrub climbing. Leaves on short petioles. Corymbs axillary, on long peduncles. Floreers dark purple.—It has been found, and I believe growing wild, near Rochester, N. Y., by my friend Dr. Samuel B. Bradley.

ORDER LXXVIII. SPIGELIACEÆ. Lind.

Calyx inferior, regularly 5-parted. Corol hypogynous, 5-lobed; æstivation valvate. Stamens 5, inserted into the corol; pollen triangular, the angles globular. Ovary free, 2-celled; ovules few; style articulated with the ovary; stigma simple. Fruit capsular, 2-celled, 2-valved, the valves turned inwards at the margin, and separating from the central placenta. Seeds several, small; albumen copious, fleshy; embryo very minute; radicle next the hilum.

Leaves entire, opposite, with stipules, or a tendency to produce them.

1. SPIGELIA. Linn.

Calyx 5-parted. Corol funnel-form; border 5-cleft, equal. Stamens 5. Anthers convergent. Capsule didymous, 2-celled, 4-valved, many-seeded. Pentandria. Monogynia.

S. marilandica Linn.: stem simple, square, smooth; leaves all opposite.

Hab. Woods. Penn. to Car. W. to Arkansa. 21.—Stem 6—18 inches high. Lawes sessile, ovate-lanceolate. Flowers in a simple secund terminal raceme, large, crimson. Medicinal. Big. Med. Bot. i. 142. Pink-root. Worm-grass.

ORDER LXXIX. GENTIANEÆ. Juss. Lind.

Calyx monophyllous, 5—10-divided, inferior, persistent. Carol hypogynous, monopetalous, usually regular, withering

or deciduous; limb divided into as many lobes as the calyx; astivation imbricate-twisted. Stamens inserted upon the corol, alternate with the segments and equal to them in number, some occasionally abortive; pollen 3-lobed or triple. Ovary single, 1—2-celled, many-seeded; style 1, continuous; stigmas 1 or 2. Fruit capsular or fleshy, 1-celled, usually 2-valved, the margins of the valves turned inwards, and in the genera with 1-cell bearing the seeds; in the 2-celled genera inserted into a central placenta. Seeds small; embryo straight, in the axis of soft fleshy albumen; radicle opposite the hilum.

Herbs, rarely shrubs. Leaves opposite, without stipules.

1. GENTIANA. Linn.

Calyx 4—5-cleft. Corol tubular at base, campanulate, or funnel-form, 4—5-cleft, with the orifice naked. Stamens 4—5, included. Stigma 2-lobed. Capsule 1-celled, 2-valved. Seeds without any margin. Pentandria. Digynia.

- * Corol 5-10-cleft, campanulate, or funnel-form.
- 1. G. saponaria Linn.: stem terete, smooth; leaves ovate-lanceolate, acute, 3-nerved; flowers axillary and terminal, sessile, capitateverticillate; corol ventricose, closed, 5-cleft; inner segments unequally 2-cleft, as long as the outer ones; segments of the calyx ovate, shorter than the tube.—G. catesbæi Walt.
 - Hab. Woods and meadows. Can. to Car. Sept., Oct. 21.—

 Stem 1—2 feet high. Leaves opposite, sessile. Flowers very large, bright blue.

 Soap Gentian.
- 2. G. ochroleuca Willd.: stem subangular; leaves ovate-lanceolate, acute, scabrous on the margin; flowers in terminal subsessile fascicles; segments of the calyx linear-lanceolate; corol campanulate-ventricose, 5-cleft; segments acute, slightly connivent; inner ones short toothed.—G. saponaria Walt.—G. villosa Linn.
 - Hab. Sandy fields. N. J. to Flor. Aug., Sept. 21.—Stem a foot high, a little scabrous. Flowers yellowish-white, inside striped with blue and purple, large.
- 3. G. pneumonanthe Linn.: stem terete, smooth; leaves linear-lanceolate, obtuse; terminal flowers fascicled; lateral ones solitary, peduncled; corol campanulate, 5-cleft; segments rounded; inner folds 1-toothed, short.—G. pseudo pneumonanthe R. & S.
 - HAB. Swamps, &c., near Portland, Maine. Big. Aug., Sept. 21.—Stem a foot high. Flowers large, blue.—Allied to G. saponaria, but much more slender in all its parts.
- 4. G. quinqueflora Willd.: stem square, branched; leaves ovate-lanceolate, subclasping, acute, 3-nerved; flowers somewhat in fives, axillary and terminal, pedicellate; corol tubular-campanulate, 5-cleft;

segments lanceolate, mucronate; calyx very short.—G. amarelloides Mich. Pursh.

- Hab. Woods. N. Y. to Car. W. to Miss. July, Aug. &.—
 Stem 12—18 inches high. Flowers small, pale blue, generally
 3—5 on the summit of the branches.
- 5. G. angustifolia Mich.: stem terete, smooth, simple, slender, 1-flowered; leaves linear, spreading, smooth, the lower ones somewhat wedge-shaped; corol funnel-form, 5-cleft; inner segments lacerate.—
 A. purpurca Walt.

Hab. Sandy fields. N. J. to Car. Aug., Scpt. 21.—Stem a foot high. Flowers large, sky blue, terminal.

- 6. G. lincaris Willd.: stem simple, somewhat scabrous; leaves linear-lanceolate, undulate, and with the segments of the calyx ciliate; flowers sessile, in crowded terminal fascicles; corol campanulate, 5-cleft; segments obtuse, with the inner folds toothed.—G. puberula Mich.
 - HAB. Mountains. Penn. Pursh. Aug. 24.—Flowers blue, mid-dle-sized.
 - ** Corol 4-eleft, funnel-form; segments ciliate. Crossopetalum.
- 7. G. erinita Willd.: stem smooth, teretc, below, square above; branches elongated, 1-flowered; leaves lanceolate, acute; corol 4-cleft; segments obovate, fringed at the top; inner folds simple.

Hab. Pastures and Woods. Can. to Car. Oct., Nov. 3.—
Stem 18 inches high. Flowers large, sky blue, fringed on the
edges, tetrandrous.
Fringed Gentian.

2. SWERTIA. Linn.

Calyx flat, 4-5-parted. Corol rotate; tube very short; border 4-5-parted; segments lanceolate, with 2 nectariferous ciliate pores at the base of each. Stamens 4-5. Style short, terminated by 2 stigmas. Capsule 1-celled, 2-valved.

Tetrandria. Monogynia.

1. S. deflexa Smith: stem 4-sided; branches short; leaves opposite, sessile, ovate; corol campanulate, with deflexed horns at the base.—S. corniculata Pursh.

Hab. Swamps. Can. and N. Y. Aug. 3.—Stem 18 inches high. Flowers axillary and terminal, greenish-yellow.—Plant almost black when dried. It has been found in Canada by Mr. Goldie, and near Fairfield, N. Y. by Prof. Hadley. Felvert.

2. S. pusilla Pursh: stem simple, 1-flowered; leaves few, small, oblong; corol rotate, twice as long as the calyx; segments oblong, accommate.

HAB. White Hills, N. H. June. 21. Pursh.—Stem an inch high. Leaves 1 or 2 pairs, small. Flowers large, blue.

3. FRASERA. Walt.

Calyx deeply 4-parted. Corol 4-parted, spreading; segments oval, with a bearded orbicular gland in the middle of each. Stamens 4. Capsule compressed, partly margined, 1-celled. Seeds few, imbricate, large, elliptic, with a membranaceous margin.

Tetrandria. Monogynia.

F. walteri Mich. - F. earoliniensis Walt. - F. verticillata Muhl.

Hab. Swamps. N.Y. to Car. July. &.—Stem 3—6 feet high, nearly square, branched, furrowed. Leaves smooth, usually whorled, sometines opposite, oblong-laneeolate. Flowers on whorled peduncles, greenish-yellow. Pedancles 1-flowered.—This rare and interesting plant has been found by Prof. Hadley in the vicinity of Fairfield, N.Y. Medicinal.

American Columbo.

4. SABBATIA. Adans.

Calyx 5—12-parted. Corol rotate, 5—12-parted. Stamens 5. Anthers at length revolute. Stigmas 2, spiral. Capsule 1-celled, 2-valved. Pentandria. Monogynia.

1. S. campanulata Torr.: stem terete; leaves linear-lanecolate, smooth; calyx as long as the corol.—Chironia campanulata Linn.

Hab. Wet grounds. Penn. to Car. July, Aug. J.—Stem a foot high, terete, with long branches. Flowers terminal, subsolitary, purple, on long peduneles.

- 2. S. stellaris Pursh: stem terete, dichotomously branched; branches elongated, 1-flowered; leaves sessile, lanceolate, acute; segments of ealyx subulate, half as long as the corol; segments of the corol obovate.—S. gracilis Ell.
 - Hab. Salt marshes, N. Y. to Car. Aug. &.—Stem 12—18 inches high. Leaves somewhat fleshy, obscurely 3-nerved. Flowers solitary, at the extremity of the branches, forming a small corymb, rose coloured.
- 3. S. angularis Pursh: stem erect, square, somewhat winged; leaves ovate, clasping; peduneles elongated, corymbed; segments of the earlyx lanceolate, much shorter than the corol.—Chironia angularis Linn.
 - HAB. Wet meadows. Can. to Car. Aug. and &.—Stem 1-2 feet high, with opposite branches. Leaves obscurely 5-nerved. Flowers rose coloured.

 American Centaury.
- 4. S. ealyeosa Pursh: stem creet, leafy, few-flowered; leaves oblong, 3-nerved; flowers solitary, 7-9-parted; ealyx leafy, longer than the eorol; segments oblanecolate.—Chironia ealyeulosa Mich.—C. dichotoma Walt.
 - HAR. Wet meadows. N. Y. to Car. Aug. 3.—Stem a foot high, slightly angled, with few branches. Leaves sessile, oval, thin. Flowers terminal, often solitary.

5. S. chloroides Pursh: stem weak, somewhat angled; leaves lanceolate, erect; branches few, 1-flowered; flowers 7—12-parted; segments of the calyx linear, shorter than the corol.—Chironia chloroides. Mich.—C. dodecandra Walt.—Chlora dodecandra Linn.

Hab. Salt bogs. N. Y. to Car. Aug. 3.—Stem 2—3 feet high. Leaves closely sessile, acute, without nerves. Flowers solitary, terminal, bright rose coloured.—This and the preceding are very variable.

6. S. corymbosa Bald.: stem erect, nearly square; leaves ovate, closely sessile; flowers corymbed; segments of the calyx subulate, much shorter than the corol.—S. paniculata var. a, Pursh.—Chironia lanccolata Wall.

Hab. Swamps. N. J. to Car. Aug., Sept. 21.—Stem a foot high, branched near the summit. Leaves somewhat clasping. Corymb few-flowered. Corol white, 4—6-parted.

5. ERYTHRÆA. Rich.

Calyx 5-cleft. Corol funnel-form; limb short, 5-cleft, spreading. Stamens 5. Anthers, after flowering, spiral. Style erect. Stigmas 2, roundish. Capsule 1-celled, linear.

Pentandria. Monogynia.

E. centaurium Pers.: stem erect, nearly simple; leaves ovate-oblong, nerved; flowers subsessile, fasciculate-paniculate; calyx half as long as the tube of the corol.—Chironia centaurium Willd.

Hab. Dry grounds. N. S. July, Aug. ©.—Stem 8—12 inches high. Leaves variable; the lower ones broader than the upper. Flowers in fascicles, near the top of the stem.—I have specimens of this plant which were found near Oswego, N. Y. by the Rev. David Brown of Lockport. It is apparently indigenous.

6. EXACUM. Linn.

Calyx deeply 4-parted. Corol 4-lobed, with the tube globose. Stamens 4. Style 1. Stigma 2-cleft. Capsule bisulcate, 2-celled, many-seeded. Tetrandria. Monogynia.

E. pulchellum Pursh: calyx 4-parted; corol 4-cleft, segments subulate; panicle corymbed; peduncle filiform.

Hab. Sea Coast. N. J. rare. Aug. . .-Flowers rose coloured.

7. HOUSTONIA. Linn.

Calyx 4-cleft. Corol funnel-form, 4-cleft. Stamens 4. Stigma simple. Capsule half superior, 2-celled, 2-valved, many-seeded, opening transversely.

Tetrandria. Monogynia.

1. H. carulea Linn.: stem erect, setaceous, dichotomous; radical leaves spatulate-oval; stem leaves lanceolate; peduncles solitary, ax-

illary, very long, 1-flowered; segments of the corol acute.-H. linnai. Mich.

HAB. Fields. N. Y. to Flor. April, May. 21.-Stem 4-8 inches high. Howers blue, sometimes nearly white.

2. H. longifolia Willd.: stem branched, smooth; leaves narrow-lanceolate, tapcring at each extremity, very smooth; flowers mostly in threes, terminal, nearly sessile.- II. angustifolia Mich.

HAB. Hills and mountains. N. Y. to Flor. W. to Miss. June. 21 .- Stem 6-10 inches high, branched at the top. Leaves about

an inch long. Flowers often by threes, purple.

3. H. purpurea Willd.: stem erect, branched above, pubeseent at the joints; leaves sessile, ovate or lanceolate, obtuse at base; flowers in terminal eorymbs.-H. varians Mich.

HAB. Dry woods. Penn. to Car. Pursh. June-Aug. 24.-Stem erect, with the angles ciliate. Leaves broad, 3-nerved.

Flowers purple, in terminal corymbs.

- 4. II. ciliolata Torr.: smooth, branched above, with remote joints; radical leaves ovate, obtuse, tapering at base; margin ciliate; stem leaves ovate-spathulate, sessile; flowers in terminal corymbs; pedicelled; peduncles trichotomous; segments of the ealyx linear-laneeolate.
 - HAB. Wet rocks. Niagara Falls, N. Y. W. to Michigan. July. 24.—Stem 4—6 inches high. Flowers terminal, blue.
 - 5. II. pubescens Raf.: leaves wedge-form, acute, pubescent; the lower ones somewhat petioled, ,lanecolate; upper ones semioval, sessile; paniele trichotomous, terminal.

HAB. Penn. and Ohio. Raf.

8. CENTAURELLA. Mich.

Calyx 4-parted, appressed. Corol subcampanulate, 4-parted; segments somewhat erect. Stamens 4. Stigma thick, glandulous and partly bifid. Capsule 1-celled, 2-valved, many-seeded, surrounded by the persistent calyx and corol.

Tetrandria. Monogynia.

C. paniculata Mich.: stem somewhat branehed, smooth; peduncles opposite, the lower ones branched; leaves minute, subulate; alternate below, nearly opposite above; flowers in panicles; corol as long as the calyx; style very short. - C. autumnalis Pursh. - Bartonia paniculata Muhl. Torr. - Sagina virginica Willd.

HAB. Damp grounds. Mass. to Car. Aug., Sept. . Stem 4-8 inches high, square, often twisted. Flowers small, greenish-white, on the ends of the branches.

9. VILLARSIA. Vent.

Calyx 5-parted. Corol rotate; tube short; limb spreading, 5-lobed, ciliate on the margin. Stamens 5. Style 1. Stigma 2-lobed. Glands 5, alternating with the stamens. Capsule 1-celled, 2-valved, many-seeded.

Pentandria. Monogynia.

V. lacunosa Pursh: leaves reniform, subpeltate, slightly crenate, lacunose beneath; petioles bearing the flowers; corol smooth.-V. aquatica R. & S.-V. trachysperma Ell.-Menyanthes trachysperma Mich.

HAB. Ponds and lakes. N. Y. to Car. Aug. 21.-Stem long, filiform, floating. Leaves on long petioles. Flowers white somewhat umbelled.—Abundant in Sand Lake, N. Y.

10. MENYANTHES. Linn.

Calyx 5-parted. Corol funnel-form; limb spreading, 5lobed, equal, hairy within. Stamens 5. Style 1. Stigma capitate. Capsule 1-celled, with the axis of the valves seminiferous. Pentandria. Monogunia.

M. trifoliata Linn. : leaves ternate, petioled, sheathing, smooth. Hab. Marshes. Subarc. Amer. to Virg. May. 21.—Stem 8—12 inches high. Flowers pale red, in a terminal raceme.

Buck-bean.

11. OBOLARIA. Linn.

Calyx 2-parted, in the form of bracts. Corol campanulate, 4-cleft; segments entire, sometimes crenulate. Stamens 4, subdidynamous, proceeding from the clefts of the corol. Stigma emarginate. Capsulc ovate, 1-celled, 2-valved, many-Tetrandria. Monogynia. seeded.

O. virginica Linn.

HAE. Woods. Penn. to Car. April, May. 21.?—Stem 4—6 inches high, cespitose, nearly simple, smooth. Leaves opposite, obovate, sessile, glaucous. Flowers in pairs or threes, towards the top of the stem, white or pale red.

ORDER LXXX. BIGNONIACEÆ. Brown. Lind.

Calyx divided or entire, sometimes spathaceous. Corol hypogynous, monopetalous, usually irregular, 4-5-lobed. Stamens 5, unequal, always 1, sometimes 3, sterile; anthers 2-celled. Ovary seated in a disk, 2-celled, or spuriously 4celled, many-seeded. Style 1; stigma of 2 plates. Capsule 1 or 2-celled, sometimes spuriously 2 or 4-celled, 2-valved. Seeds transverse, compressed, often winged; albumen none; embryo straight, foliaceous; radicle next the hilum.

Trees or shrubs, often twining or climbing. Leaves opposite, or rarely alternate, without stipules.

1. BIGNONIA. Linn.

Calyx 5-toothed, cyathiform, partly coriaceous. Corol 5-lobed, campanulate, ventricose on the under side. Stamens didynamous. Pod 2-celled. Seeds membranaceously winged.

Didynamia. Angiosperma.

B. radicans Linn.: stem creeping; leaves pinnate; leafets ovate, toothed, acuminate; corymb terminal; tube of the corol three times as long as the calyx.

HAB. Banks of streams. Penn. to Flor. W. to Miss. July, Aug. b.—Creeping on trees and rocks. Flowers very large, scarlet.

Trumpet Flower.

2. CATALPA. Juss.

Calyx 2-parted. Corol campanulate; tube ventricose; border 4-lobed, unequal. Stamens 2, fertile; 2—3 sterile. Stigma in 2 plates. Capsule pod-form, long, cylindric, 2-valved. Dissepiment opposite to the valves. Seed membranaceously margined.

Diandria. Monogynia.

C. cordifolia Ell.: leaves simple, cordate, entire; flowers panicled.—C. bignonioides Walt.—C. syringafolia Sims. Pursh.—Bignonia Catalpa Linn.

Hab. Fields, about habitations. N. Y. to Flor. and throughout the Western and Southwestern States. July. 5.—A large tree with irregular branches. Leaves round, cordate, whorled in threes, large. Flowers white, yellow and purple, in large pyramidal terminal panieles. Probably introduced, as it is generally found in the vicinity of habitations, Indian encampments, &c.

ORDER LXXXI. PEDALINEÆ. Brown. Lind.

Calyx divided into 5 nearly equal pieces. Corol monopetalous, hypogynous, irregular; tube ventricose, the limb 5-lobed, bilabiate. Stamens 4, didynamous, (2 sometimes sterile,) with the rudiment of a fifth. Ovary seated in a glandular disk, 1—2-celled, of 2 carpels, the introflexed margins of which by splitting and diverging constitute several cells; ovules few in each spurious cell; style 1; stigma divided. Fruit drupaceous, or rarely capsular and 2-valved, spuriously many-celled. Seeds few, large, pendulous; albumen none; embryo straight.

Herbs, with opposite leaves and axillary flowers.

1. MARTYNIA. Linn.

Calyx 5-cleft. Corol ringent. Capsule ligneous, corticate, 4-celled, 2-valved; each of the valves terminating in a long hooked beak.

Didynamia. Angiospermia.

M. proboscidea Linn.: stem viscid, pubescent, branched, mostly decumbent; leaves alternate, cordate, nearly round, very entire, villous; flowers axillary, on long peduncles.

HAB. River banks. Penn. to Car. W. to Miss. Aug., Sept.

—Stem 1—2 feet long. Flowers dull yellow, large, spotted.

Whole plant fetid.

Unicorn Plant.

ORDER LXXXII. POLEMONIACEÆ. Lind.

Calyx 5-parted, persistent, sometimes irregular. Corol regular, 5-lobed. Stamens 5, inserted on the middle of the tube of the corol and alternate with its segments. Ovary superior, 3-celled; ovules ascending; style simple; stigma trifid. Capsule 3-celled, or spuriously so, 3-valved, with a loculicidal dehiscence; the valves separating from the axis. Seeds angular or oval, often enveloped in mucus, ascending; embryo straight in the axis of horny albumen; radicle inferior, next the hilum; cotyledons elliptical, foliaceous.

Herbs, with opposite or alternate, simple or variously divided leaves.

1. PHLOX. Linn.

Calyx prismatic, deeply 5 cleft; segments connivent. Corol salver-form; border 5-lobed, flat; lobes cuneate. Stamens inserted above the middle of the tube of the corol, very unequal. Capsule roundish, ovate, 3-celled; cells 1-seeded.

Pentandria. Monogynia.

1. P. paniculata Linn.: stem erect, smooth; leaves lanceolate, flat, the margin scabrous; corymb panicled; segments of the corol rounded; calyx tapering to an awn.

HAB. Meadows. Penn. to Car. June, July. 21.—Stem 2—3 feet high. Leaves opposite. Flowers in opposite corymbs, somewhat paniculate, purple; tube of the corol pubescent, much longer than the calyx.

2. P. pyramidalis Smith: erect, smooth; stem scabrous; leaves cordate-ovate, acute; panicle fastigiate, pyramidal; segments of the corol cuneate, truncate; teeth of the calyx somewhat erect, lanceolate, acute.

Hab. Mountain meadows. Penn. to Car. Aug. 21. Pursh.—
Stem 2—3 feet high. Leaves opposite, sessile, very entire.
Corol beautiful purple.

3. P. maculata Linn.: stem erect, scabrous and spotted; leaves oblong-lanceolate, smooth, with the margin scabrous; panicle oblong,

many-flowered; segments of the corol rounded; teeth of the calyx acute, recurved.

b. suaveolens Nutt.: stem without spots; corol white.—P. suaveolens Ait.—P. maculata var. candida Mich.

- HAB. Moist meadows. N. J. to Car. June. 21.—Stem 2—3 feet high, simple. Corymbs few-flowered. Corol pale purple. Var. b. according to Mr. Nuttall is only a white flowered variety, raised from seed.
- 4. P. aristata Mich.: stem erect, weak, viscid-pubescent; leaves linear or linear-lanceolate; panicle lax, fastigiate; segments of the corol obovate; tube curved, pubescent; teeth of the calyx very long, subulate.
 - HAB. Wet woods. N. J. to Car. W. to Miss. June. 24.—
 Stem 18 inches high, simple. Leaves sometimes nearly linear, with the margins revolute. Teeth of the calyx awned. Corol pale purple or white.—P. pilosa is not distinct from this species.
- 5. P: diraricata Linn.: stem low, pubescent, decumbent; leaves oval-lanceolate, the upper ones alternate; branches divaricate, loose, few-flowered; segments of the corol slightly obcordate; teeth of the calyx linear, subulate.
 - HAB. N. Y. and Penn. June. 24.—Stems numerous, 9—12 inches high. Flowers in a terminal panicle, blue.—Dr. Gray informs me that this species is very abundant near Utica, N. Y.
- 6. P. reptans Mich.: pubescent, with creeping suckers; radical leaves spatulate-obovate; stem leaves oval-lanceolate; corymb few-flowered, divaricate; segments of the corol obovate; teeth of the calyx subulate, reflexed.—P. stolonifera Pursh.

HAB. Mountains. Penn. to Car. June. 24.—Stem 6-8 inches high. Flowers in a small corymb, blue, with a purple centre.

- 7. P. subulata Linn.: procumbent, cespitose, pubescent; leaves linear-subulate, rigid, ciliate; corymb few-flowered; segments of the corol wedgeform, emarginate; calyx with subulate teeth shorter than the tube of the corol.
 - HAB. Rocky hills. N. J. to Car. April, May. 21.—Stem 3—4 inches high. Flowers pink, with a purple centre.—Very abundant near New-Brunswick, N. J.
 Mountain Pink.
- 8. P. setacea Linn.: procumbent, cespitose, hairy; leaves fasciculate, subulate, ciliate, rigid'; pedicels few-flowered, terminal, somewhat umbelled; segments of the corol wedgeform, emarginate; teeth of the calyx subulate, much shorter than the tube of the corol.
 - Hab. Penn. to Car. May. 21.—Flowers large, reddish, with a purple star in the centre.—Resembles the preceding, but the leaves are longer and more hairy.

2. POLEMONIUM. Linn.

Calyx campanulate, 5-cleft. Corol rotate; limb 5-lobed, erect. Stamens 5; filaments broader at the base, inserted

upon the 5 teeth or valves which close the orifice of the corol.

Anthers incumbent.

Pentandria. Monogynia.

P. reptans Linn.: stem erect, branched, smooth; leaves pinnate, mostly by sevens; leafets ovate-lanceolate, acute; flowers terminal, nodding.

HAB. Hills. N. Y. to Car. W. to Miss. May. 21.—Stem a foot high. Flowers blue, somewhat corymbose.

Jacob's Ladder.

ORDER LXXXIII. CONVOLVULACEÆ. Lind.

Calyx 5-divided, persistent. Corol deciduous, regular, 5-lobed; estivation usually plicate. Stamens 5, inserted into the base of the corol, alternate with its segments. Torus discoid. Ovary free, with 2—4-cells, seldom with 1; ovules, erect, definite, when more than 1 collateral; style 1, sometimes entire, usually bifid, rarely 2; stigmas obtuse or acute. Capsule with from 1—4-cells; the valves fitting at their edges to the angles of a loose dissepiment, bearing the seeds at the base, sometimes valveless or dehiscing transversely. Seeds at the base of the placentæ; albumen mucilaginous; embryo curved; cotyledons shrivelled; radicle inferior.

Herbs or shrubs, usually twining and with a milky juice. Leaves alternate, without stipules.

1. CONVOLVULUS. Linn. Spreng.

Calyx 5-parted, naked or with 2 bracts at base. Corol funnel-form or campanulate, with 5 plaits. Stamens 5, shorter than the limb. Ovary 2—3-celled; cells 2-seeded. Style undivided. Stigma capitate, lobed or divided. Capsule valved, 1—4-celled.

Pentandria. Monogynia.

Obs. I concur with Sprengel in uniting Ipomaa with this genus; which can scarcely be distinguished, except perhaps, by its simple stigma—a character too unimportant for the basis of a generic distinction.

1. C. arcensis Linn.: stem climbing; leaves saggitate, with acute lobes; peduncles mostly 1-flowered; bracts minute, remote from the flower.—C. sagittifolius Mich.?

Hab. Fields. Maine to Car. rare. June, July. 21.—Stem hairy, often prostrate. Leaves rather hastate. Flowers white, an inch long, on axillary peduncles; which are longer than the leaves.—This plant has been found on the banks of the canal near this city.

- 2. C. sepium Linn.: stem elimbing, angular, twisted; leaves sagitate, very acute, with the lobes truncate; peduncles square, 1-flowered; bracts large, cordate, close to the flower.—Calystegia sepium Brown.
 - Hab. Hedges and woods. Can. to Car. June, July. 24.—Stem climbing or trailing, pubescent. Flowers large, white, on peduncles which are longer than the leaves. Great Bind-weed.
- 3. C. panduratus Linn.: stem climbing, pubescent; leaves eordate, entire or lobed and panduriform; peduncles long; flowers in fascicles; calyx smooth; corol tubular-campanulate.
 - HAB. Sandy fields. N. Y. to Car. July. 21.—Root very large and thick. Stems numerous, trailing. Peduncles 1—4. Flowers large, purple.—Found in Orange co., N. Y., by Dr. W. Horton, Jun. Medicinal.

 Man of the Earth.
- 4. C. spithamaus Linn.: stem erect or trailing; leaves oval or oblong, subcordate, pubescent, hoary; peduncles 1-flowered, about as long as the leaves; bracts much longer than the calyx.—C. stans Mich.—Calystegia tomentosa and spithamaea Pursh.
 - Hab. Sandy woods. Can. and N. S. June. 21.—Stem erect or spreading. Flowers white, on peduncles which are about as long as the leaves.
- 5. C. purpureus Linn.: stem twining and climbing; leaves cordate, acuminate, undivided, entire; peduncles 2—3-flowered; pedicels thickened, nodding; capsule smooth.—Ipomaa purpurea Pursh. Torr.
 - HAB. Fields, &c. July, Aug. O.—Stem hairy, elimbing to a great height. Flowers large, blue, purple or nearly white. Introduced.

 Common Morning Glory.
- 6. C. lacunosus Spreng.: stem smooth; leaves cordate, acuminate, angled at base; peduncles short, generally 1-flowered; calyx hairy; corol tubular, short; capsule hairy.—Ipomaa lacunosa Linn. Parsh. Torr.
 - Hab. Penn. Muhl. S. to Flor. Aug., Sept. @.—Flowers white with a purple rim.
- 7. C. nil Linn: stein hairy, twining; leaves cordate, 3-lobed; peduncles short, 1—3-flowered; calyx very villous; segments acuminate, subulate; corol funnel-form.—Ipomaa nil Pursh. Torr.
 - HAB. Penn. Muhl. S. to Car. Aug. O.—Flowers 1—2, on peduncles shorter than the petioles. Corol white at base, blue near the border.

 Morning Glory.

2. CUSCUTA. Linn.

Calyx 5- rarely 4-cleft. Corol globose-urceolate; limb 4—5-cleft, marcescent. Stamens 4—5, inserted into the corol. Stigmas 2. Capsule 2-celled, opening all round transversely; cells 2-seeded. Pentandria. Digynia.

1. C. americana Linn.: flowers in umbellate clusters, pedunculate,

5-cleft; stigmas capitate; corol tubular-bell-shaped, with the border small and spreading.

Hab. Low grounds. Can. to Car. W. to Miss. June, July.

O.—Stem filiform, twining around other plants; parasitic. Flowers small, white.

American Dodder.

2. C. curopea Linn.: flowers in sessile clusters; corol 4-5-cleft, without scales at the base of the stamens; stamens 4-5; stigmas simple.

HAB. Parasitic on flax, &c. Sch'y, N.Y. July. . —Stem filiform, long and climbing, leafless. Flowers clustered, pale yellow or rose coloured. Introduced. Dodder.

ORDER LXXXIV. HYDROLEACEÆ. Kunth. Lind.

Calyx 5-parted, persistent; astivation imbricated. Corol regular, monopetalous, not always agreeing with the calyx in the number of its divisions. Stamens 5, inserted on the corol, equal; anthers deeply lobed at the base, 2-celled. Ovary superior, surrounded by an annular disk, 2—3-celled; ovules indefinite; styles 2 or 3; stigmas thickened. Fruit capsular, 2—3 celled, splitting through the middle of the cells. Seeds indefinite, very small; embryo straight in the axis of a fleshy albumen; radicle next the hilum; cotyledons flat.

Herbs, or underskrubs. Leaves alternate, entire or lobed, without stipules.

1. DIAPENSIA. Linn.

Calyx 5-parted, subtended by 3 bracts. Corol salverform; border 5-cleft, flat. Stamens 5, from the summit of the tube, alternating with the segments of the corol. Stigmas 3. Capsule 3-celled, 3-valved, many-seeded.

Pentandria. Monogynia.

- 1. D. lapponica Linn.: cespitose; leaves spatulate, smooth; flower terminal, solitary, on short peduncles; anthers simple.—D. obtusifolia Pursh.
 - Hab. Summits of the White Mountains, N. H. June. 2f.—

 Stems short, diffuse. Leaves crowded, fleshy, evergreen, very entire. Flowers white.
- 2. D. barbulata Ell.: leaves lanceolate-wedgeshaped, pubescent at base; flower solitary, terminal, sessile; anthers horizontal, beaked at base.—D. cuncifolia Pursh.—Pyxidanthera barbulata Mich.
 - HAB. Pine barrens. N. J. to Car. May, June. 21.—Plant small, creeping, forming dense mats; branches assurgent, 1-flowered. Upper leaves crowded near the base of the flower which is small and white.—Very abundant in New-Jersey.

ORDER LXXXV. BORAGINEÆ. Juss. Lind.

Calyx 5-divided, persistent. Corol hypogynous, monopetalous, regular, 5-cleft; æstivation imbricate. Stamens inserted into the corol, alternate with its segments; anthers erect. Ovary 4-lobed, 4-celled; ovules 4, each suspended from the inner angle near the summit of the cell; style simple, arising from the base of the lobes of the ovary; stigma simple or bifid. Nuts 4, distinct. Seed separable from the pericarp, destitute of albumen; embryo with a superior radicle; cotyledons plano-convex.

Herbs or shrubs with round stems. Leaves alternate, scabrous, without stipules.

1. LITHOSPERMUM. Linn.

Calyx 5-parted. Corol funnel-form, small, 5-lobed. Stamens included. Nuts imperforate at base, shining, smooth or rugose. Pentandria. Monogynia.

1. L. arvense Linn.: stem erect, branched; leaves sessile, linear-lanceolate, rather acute, veinless, rough, hairy; calyx a little shorter than the corol; segments spreading; nuts rugose.

Hab. Fields. N. S. April, May. —Plant hispid-pilose. Flowers solitary, axillary, white. Calyx with the segments thrice as long as the fruit. Introduced. —Corn Gromwell.

- 2. L. officinale Linn.: stem erect, much branched, covered with rigid hairs; leaves broad-lanceolate, acute, nerved, rough on the upper surface, hairy on the lower; tube of the corol as long as the calyx; nuts smooth.
 - Hab. Fields. N. S. May. 21.—Stem 1—2 feet high. Flowers axillary, pale yellow. Nuts whitish-brown, highly polished. Introduced. Common Gromwell.
- 3. L. denticulatum Lehm.: stem erect; leaves nerved, subglabrous, acute; margin scabrous, with minute teeth; radical ones ovate; those on the stem oblong; segments of the calyx denticulate on the margin.

 —Pulmonaria sibirica Pursh. App.

Hab. New-York. June. 21. Muhl.—Stem 6—10 inches high. Peduncles many-flowered. Corol purple.

4. L. maritimum Lehm.: very smooth; stem procumbent, branched; leaves ovate, obtuse, fleshy, glaucous.—Pulmonaria maritima Linn.

Hab. Sea shore. New-Eng. Pursh. N. to Subarc. Amer. July. 21.—Stem diffuse, much branched. Lower leaves on petioles, and acute; upper ones sessile. Flowers somewhat racemed, purplish-blue; tube short. Seaside Gromwell.

2. BATSCHIA. Gmel.

Calyx 5-parted. Corol salver-form, rather large; tube straight, much longer than the calyx, closed at the base by a bearded ring; orifice naked or partially closed; border orbiculate, nearly flat, segments rounded. Nuts shining.—Flow-Pentandria. Monogynia. ers yellow.

- 1. B. canescens Mich.: stem erect, simple, villous; leaves oblong, obtuse, slightly mucronate, silky above, subvillous beneath; flowers axillary, crowded near the top of the stem; tube of the corol as long again as the calyx.—Anchusa canescens Muhl.—Lithospermum canescens Lchm. Torr.
 - Hab. Hills. N. Y. to Virg. N. to Subarc. Amer. W. to Miss. June, July. 21.—Stem 8—12 inches high. Flowers axillary, crowded near the top of the stem, bright orange.—Found near Fairfield, N. Y. by Prof. Hadley. Used by the Indians as a red
- 2. B. gmelini Mich.: plant hirsute; stem simple; floral leaves ovate; those of the stem oblong; flowers in a terminal raceme; calyx with long lanceolate segments.—Batschia caroliniensis Gmel.—Anchusa hirta Muhl.

AB. Woods. Penn. to Car. June, July. 21.—Stem 8—12 inches high. Flowers in a terminal raceme, orange. HAB.

3. ONOSMODIUM. Mich.

Calyx deeply 5-parted; segments linear. Corol somewhat tubular-campanulate; border ventricose, half 5-cleft; segments Anthers sessile, included. Style much connivent, acute. exserted. Nuts imperforate, shining.

Pentandria. Monogynia.

1. O. hispidum Mich.: stem hispid, branched; leaves obovate-lanceolate, hairy, papillose-punctate; segments of the corol subulate. -Lithospermum virginianum Linn.—Purshia hispida Lehm.

HAB. Hills. N. Y. to Car. Aug. 21.—Stem 1-2 feet high. Flowers white, in simple leafy secund racemes which at first are recurved and afterwards straight.

2. O. molle Mich.: whole plant white-villous; leaves oblong-oval, somewhat 3-nerved; segments of the corol semi-oval. - Lithospermum molle Muhl. - Purshia mollis Lchm.

HAB. N. Y. and Penn. S. W. to Tenn. July, Aug. 21.-Differs from the former in its soft white pubescence, and in the broader segments of its corol. It has been found by Mr. George W. Clinton, in the sand plains near Albany.

4. SYMPHYTUM. Linn.

Calyx 5-parted. Corol ventricose, its orifice closed with connivent subulate scales. Nuts imperforate at base.

Pentandria. Monogynia.

S. officinale Linn. : stem hispid; radical leaves on long petioles, rough; those of the stem ovate-lanceolate below, lanceolate above, sessile, very decurrent and winging the upper part of the stem.

HAB. Springy grounds. N. Y. and Penn. June. 1-3 feet high, branched above. Racemes in pairs, secund, drooping. Corol large, yellowish-white.-Apparently native near Fairfield, N. Y. Comfrey.

5. ECHIUM. Linn.

Calyx 5-parted. Corol subcampanulate; tube very short; border broader, unequally and obliquely 5-lobed. Nuts imperforate at base, tuberculate. Pentandria. Monogunia.

E. rulgare Lim.: stem erect, bristly and tuberculate; leaves lanceolate, very hispid, radicle ones petiolate, spreading, very long; flowers in lateral spikes; stamens longer than the corol.

AB. Hills. N. S. June, July. &.—Stem 2—3 feet high. Flowers large, blue, in lateral spikes, which are at first recurved but gradually become erect. Introduced. Viper's Bugloss.

6. LYCOPSIS. Linn.

Calyx 5-cleft. Corol funnel-form, with an incurved tube: orifice closed with convex connivent scales. Nuts perforate at the base. Pentandria. Monogunia.

L. arvensis Linn.: leaves lanceolate, repand-denticulate, very hispid; lower ones tapering into a petiole; upper ones sessile, subclasping; racemes leafy; calyx erect while in flower, shorter than the tube of the corol.—Anchusa arvensis Lehm.

HAB. Sandy fields. N. S. June, July. O .- Stem 12-18 inches high. Flowers bright blue, in a leafy raceine. Introduced. ?

Small Bugloss.

7. MYOSOTIS. Lim.

Calyx 5 cleft. Corol salver-form; tube short; limb flat. with 5 emarginate lobes; orifice closed, with short connivent scales. Nuts smooth or scabrous. Pentandria. Monogunia.

1. M. palustris Roth.: leaves oblong-lanceolate, rough, with short mostly appressed hairs; racemes rather short; peduncles when in fruit divergent, twice as long as the 5-cleft spreading calvx; border of the corol expanded, longer than the tube .- M. scorpioides Willd .-M. scorpioides var. palustris Linn.

Hab. Ditches and wet grounds. Can. and N. S. May—July. 21.—Stem 12—18 inches high. Flacers very small, bright blue, in secund racemes .- Our plant differs from the foreign one, in having the flowers very small. Marsh Scorpion Grass.

2. M. arvensis Sibth.: leaves oblong-lanceolate, hairy; racemes very long; pedicels when in fruit spreading, twice as long as the 5-cleft and closed calyx; limb of the corol erect-spreading, about as long as the tube.—M. scorpioides var. arvensis Linn.—M. verna Nutt.

Hab. Sandy woods. Can. and N. S. W. to Miss. June. ③.

Hab. Sandy woods. Can. and N. S. W. to Miss. June. ②.

—Plant gray, pubescent. Stem 4—10 inches high. Flowers very small, white, on long pedicels. Field Scorpion Grass.

8. ECHINOSPERMUM. Lehm.

Calyx 5-parted. Corol salver-form, closed by connivent scales. Nuts fixed to a central column, echinate, compressed.

Pentandria. Monogynia.

1. E. lappula Lchm.: stem branched above; leaves lanceolate or linear-lanceolate, hairy; corol longer than the calyx; border erect, spreading; nuts with 2 rows of hooked prickles on the margin.—Myosotis lappula Linn.—Rochelia lappula R. & S. Torr.

HAB. Road sides. Can. and N. S. N. to Subarc. Amer. July.
- Stem a foot high, branched above. Flowers minute, blue,

erect when in fruit.

2. E. virginicum Lehm.: leaves oblong-lanceolate, acuminate, scabrous above; racemes divaricate, dichotomous; nuts densely covered with hooked prickles.—Myosotis virginiana Linn.—Rochelia virginiana R. & S. Torr.

Hab. Can. to Car. July. 3.—Stem 2 feet high. Leaves very large. Flowers minute, pale blue, in dichotomous racemes.

9. CYNOGLOSSUM. Linn.

Calyx 5-parted. Corol short, funnel-form, 5-lobed; orifice closed with convex connivent scales. Nuts depressed, affixed to the styles by their inner margin.

Pentandria. Monogynia.

1. C. officinale Linn.: leaves lanceolate, attenuate at the base, sessile, downy; lower ones large, petiolate; upper ones subclasping; flowers in terminal racemes; stamens shorter than the corol.

HAB. Road sides, &c. N. S. June, July. 3.—Plant dull green, soft and downy, fetid. Flowers purplish-red. Fruit rough. Introduced. Hound's Tongue.

2. C. virginicum Linn.; leaves oval-oblong, acute, hairy; lower ones long, petiolate; upper ones cordate and clasping at the base; corymb on a large almost naked panicle.—C. amplexicaule Mich.

HAB. Shady woods. N. Y. to Car. May. 21.—Stem 2.—3 feet high, very hispid. Leaves less hairy than in the former. Flowers

in a small terminal corymb, blue.

10. PULMONARIA. Linn.

Calyx prismatic, 5-sided. Corol funnel-form, somewhat 5-lobed; orifice naked. Nuts imperforate at base.

Pentandria. Monogynia.

P. virginiea Linn.: smooth; stem erect; radical leaves obovateoblong, obtuse; stem leaves narrower; flowers in terminal racemes or fascicles; calyx much shorter than the tube of the corol; segments lanceolate, acute. - Lithospermum pulchrum Lehm.

IIAB. Wet grounds. N. Y. to Car. W. to Miss. May. 21.— Stem 6—12 inches high. Leaves smooth and a little glaucous. Flowers large, bright blue, in terminal racemes. Plant turning Lungwort.

black by drying.

Lind. ORDER LXXXVI. HYDROPHYLLEÆ.

Calyx 5-10-divided, persistent. Corol monopetalous, regular, or nearly so, 5-lobed, with 2 lamellæ towards the base of each constituent petal. Stamens alternate with the lobes of the corol; anthers ovate, 2-celled, versatile, bursting longitudinally. Ovary free, simple, 1-celled; ovules definite or indefinite, suspended; style terminal, bifid; stigmas 2. Placenta 2, parietal, or on stalks from the base of the cavity. Fruit capsular, few, or many-seeded, invested with the permanent calyx. Seeds definite or indefinite; embryo taper, lying at the end of a copious cartilaginous albumen; radicle superior.

Hispid herbs. Leaves opposite, or alternate and lobed.

1. HYDROPHYLLUM. Linn.

Calyx 5-parted. Corol campanulate, 5-cleft, with 5 longitudinal margined melliferous grooves on the inside. Stamens 5, exserted; filaments bearded in the middle. Stigma bifid. Capsule globose, 1-celled, 2-valved, 1-seeded, 3 other seeds Pentandria. Monogynia. mostly abortive.

1. H. virginicum Linn.: stem nearly smooth; leaves pinnatifid and pinnate; segments oval-lanceolate, with deep serratures; clusters of flowers crowded; peduncles larger than the petioles.

HAB. Woods. Can. to Car. June. 21.—Stem 18 inches high. Flowers white and blue, in compact lateral and axillary clusters.

2. H. canadense Linn.: somewhat hairy; leaves angularly sub-5lobed, cordate at base; remotely serrate; flowers in crowded fascicles; peduncles shorter than the petioles.

HAB. Mountains. Can. and N. S. June. 21.—Stem 18 inches high. Leaves large and broad, somewhat palmate, about 5-7-

lobed. Flowers blue and white, in clusters.

NEMOPHILA. Nutt.

Calyx 10-parted; alternate lobes reflexed. Corol subcam

panulate, 5-lobed; the lobes emarginate, with margined nectariferous cavities at base. Stamens 5, shorter than the corol; filaments naked. Style 2-cleft. Capsule fleshy, 1-celled, 2-valved, 4-seeded.

Pentandria. Monogynia.

N. paniculata Spreng.: very hairy; radical leaves subpinnatifid: cauline ones angularly lobed; sinuses of the calyx with minute oval

appendages.-Hydrophyllum appendiculatum Mich.

Hab. Moist woods. Penn. and Virg. W. to Miss. May. 3.

—Stem a foot high. Flowers blue, on short peduncles, somewhat paniculate.—Very properly separated from the preceding genus.—See Nutt. in Jour. Phil. Acad. ii. 179.

3. PHACELIA. Juss.

Calyx 5-parted. Corol subcampanulate, 5-cleft, with 5 longitudinal margined melliferous grooves on the inside. Stamens 5, exserted. Style filiform. Stigmas 2. Capsule 2-celled, 2-valved, 4-seeded, each of the valves septiferous in the centre.

Pentandria. Monogynia.

1. P. fimbriata Mich.: whole plant hairy; stem ascending; leaves pinnatifid with undivided lobes; flowers in a simple terminal raceme; segments of the corol fimbriate.

Hab. Alluvial soil. Penn. to Geor. W. to Miss. May, June. 21.?—Stem a foot high. Flowers blue, in a terminal raceme, at first revolute, afterwards erect.

2. P. bipinnatifida Mich.: stem erect, hairy; leaves pinnatifid, segments incisely lobed; racemes mostly bifid, oblong, many-flowered; divisions of the corol entire.

Hab. Mountains. Penn. W. to Miss. May, June. 24.?—
Stem a foot high. Flowers blue, in terminal racemes.

3. P. parviflora Pursh: stem diffuse, pubescent; leaves subsessile, pinnatifid; segments oblong, rather obtuse, entire; racemes solitary; pedicels short; segments of the corol round, very entire.—Polemonium dubium Willd.

HAB. Penn. May. O.—Stem 6—8 inches high. Flowers pale blue, much smaller than in the preceding.—May belong to a different genus.

ORDER LXXXVII. SOLANEÆ. Juss. Lind.

Calyx 5- rarely 4-parted, persistent. Corol monopetalous, hypogynous; limb 5- rarely 4-cleft, regular or somewhat unequal, deciduous; estivation plaited, or somewhat imbricate. Stamens inserted on the corol, alternate with its segments, sometimes 1 abortive; authers bursting longitudinally or by terminal pores. Ovary 2 or more celled; style continuous;

stigma obtuse, rarely lobed. Fruit either a capsule, which is 2—4-celled, 2—4-valved, with a double dissepiment, parallel with the valves, or a berry with the placentæ adhering to the dissepiment. Seeds numerous, sessile; embryo more or less curved, often eccentric, lying in fleshy albumen; radicle next the hilum.

Herbs or shrubs. Leaves alternate.

DIV. I. Fruit a berry. 1. SOLANUM. Linn.

Calyx 5-cleft. Corol rotate, 5-cleft, spreading. Anthers 5, erect, connivent, opening with 2 pores at the extremity. Berry subglobose, 2-rarely 4-celled.

Pentandria. Monogynia.

1. S. dulcamara Linn.: stem fruticose, flexuous, without thorns, smooth or pubescent; leaves ovate-cordate, smooth; upper ones hastate; flowers in lateral clusters.

Hab. Low grounds. N. S. July, Aug. 5.—Stam climbing.

Flowers purple, with 2 green tubercles at the base of each segment. Berries red, oval. Woody Night-shade. Bitter-sweet.

2. S. nigrum var. virginianum Linn.: stem herbaceous, without thorns, angular, toothed; leaves ovate, obtusely toothed and waved; flowers subumbelled.—S. nigrum Big.

Har. Old fields. Can. to Car. July, Aug. @.—Stem erect, 2—3 feet high, angles roughened. Flowers nodding, white, 3—6 in an umbel. Berries spherical, black, 2-celled.

Common Night-shade.

3. S. carolinense Linn.: stem annual, aculeate; leaves ovate-oblong, tomentose, hastate-angled, prickly on both sides; raceme simple, lax; berries globose.

Hab. Road sides, &c. Penn. to Car. W. to Miss. June. 21.
—Stem erect, branched, a foot high, armed with sharp prickles.
Flowers white, in lateral racemes. Berries yellowish.

Horse Nettle.

2. PHYSALIS. Linn.

Calyx 5-cleft. Corol rotate, 5-cleft. Anthers 5, oblong, erect, connivent. Berry globose, covered by the inflated calyx. Pentandria. Monogynia.

1. P. viscosa Linn.: leaves in pairs, subcordate-oval, repand, obtuse, subtomentose, a little viscous; stem herbaceous; paniculate above; fruit bearing calyx pubescent.

HAB. Road sides. N. Y. to Car. W. to Miss. July, Aug. 25. -Stem 2-3 feet high. Flowers yellow. Berries viscous.

Ground Cherry.

2. P. obscura Mich .: pubescent ; stem prostrate, divaricate ; leaves broad-cordate, subsolitary, unequally and coarsely toothed; flower solitary, nodding; calyx very hairy .- P. pruinosa Ell. ?

3. P. lanccolata Mich.: stem erect, densely pubescent; leaves mostly in pairs, oval-lanceolate, very entire, narrowed at the base into a petiole; flower solitary, nodding; calyx villous.

HAB. Penn. Muhl. S. to Car. July. 21.-Stem 1-2 feet high.

Flowers pale yellow.

4. P. pennsylvanica Linn.: stem herbaceous, branched; leaves ovate, somewhat repand, obtuse, nearly naked; peduncles axillary, solitary, a little longer than the petioles.

Road sides. Penn. to Car. July-Sept. 21 .- Stem a

foot high. Flowers yellow. Berries red.

3. NICANDRA. Adans.

Calyx 5-parted, 5-angled, the angles compressed, segments sagittate. Corol campanulate. Stamens incurved. Berry 3-5-celled, covered by the calyx. Pentandria. Monogynia.

N. physaloides Pers.: stem herbaceous; leaves sinuate, angled, glabrous; flowers solitary, axillary, on short peduncles; calyx closed, with the angles very acute. - Atropa physaloides Linn.

Hab. Cultivated grounds. N. Y. to Car. July, Aug. . -Stem 2-3 feet high, much branched. Leaves alternate. Flowers solitary, axillary, on short peduncles, pale blue. Introduced.

Div. II. Fruit a capsule.

4. NICOTIANA. Linn.

Calyx urceolate, 5-cleft. Corol funnel-form, 5-cleft, regular. Stamens 5. Stigma emarginate, Capsule 2-valved.

Pentandria. Monogynia.

N. rustica Linn .: plant viscid-pubescent; stem terete; leaves petioled, ovate, very entire; tube of the corol cylindrical, longer than the calyx; segments round.

Western part of New-York. Nutt. @ .- Stem 12-18 inches high. Flowers greenish-yellow, in a terminal panicle or raceme.—According to Mr. Nuttall it has been introduced by the Indians. Tobacco.

5. DATURA. Linn.

Calyx large, tubular, ventricose, 5-angled, deciduous; the

base orbicular, peltate and persistent. Corol funnel-form, with the tube long, the limb 5-angled and plaited. Stamens 5. Stigma bilamellate. Capsule smooth or echinate, 2-celled; cells 2-3-parted. Pentandria. Monogynia.

D. stramonium Linn.: stem dichotomously branched; leaves ovate, smooth, angular-dentate, somewhat cordate; capsule spiny, erect.

b. tatula Torr.: stem and flowers purple. - D. tatula Linn.

HAB. Waste grounds, &c. Throughout the U.S. July—Sept.

©.—Stem 2—6 feet high. Flowers solitary, large, blue and white, on peduncles. Very fetid. Medicinal and poisonous. Big. Med. Bot. i. 16.

Jamestown Weed. Thorn-apple.

6. HYOSCYAMUS. Linn.

Calyx tubular, 5-cleft. Corol funnel-form, irregular, lobes obtuse. Stamens 5. Stigma capitate. Capsule ovate, operculate at the extremity. Pentandria. Monogynia.

H. niger Linn.: hispidly pilose and fetid; stem erect, very leafy; leaves sinuate, clasping; flowers sessile, arranged in terminal recurved leafy spikes; corol reticulate.

HAB. Waste places. N. Y. and Penn. June. ② or 3.—Stem 12—18 inches high. Flowers large, dull yellow, with purple veins.—Introduced.? Fetid, poisonous and medicinal.

Henbane.

7. VERBASCUM. Linn.

Calyx 5-parted. Corol rotate, 5-lobed, unequal. Stamens 5, declined, often hairy. Capsule 2-valved, ovate or globose. Pentandria. Monogynia.

1. V. thapsus Linn.: stem simple, erect, tomentose; leaves ovateoblong, decurrent, very woolly on both sides; flowers in a long dense terminal spike; stamens unequal, two smooth.

Hab. Road sides, &c. Throughout the U. S. June. 3.—

Stem 3-6 feet high, angular, winged. Flowers yellow, in a long dense cylindrical spike. Introduced.?

Mullein.

2. V. blattaria Linn.: stem angled, smooth; leaves clasping, oblong, serrate; flowers in a terminal raceme; peduncles 1-flowered, solitary.

Hab. Road sides. N. Y. to Car. June, July. 3.—Stem 2 feet high. Flowers white and yellow.—Considered by some as distinct varieties.

distillet varieties.

3. V. lychnitis Linn.: leaves oblong-cuneiform, naked above, white-tomentose beneath; stem angular, panicled; spikes lax, lateral and terminal.

HAB. Penn. Pursh. S. to Car. June, July. J .- Stem straight

and angled. Leaves very white beneath. Flowers pale yellow, clustered, on short peduncles.

ORDER LXXXVIII. OROBANCHEÆ. Juss. Lind.

Calyx divided, persistent. Corol irregular, usually bilabiate, persistent; æstivation imbricated. Stamens 4, didynamous. Ovary superior, seated in a fleshy disk, with 2—4-parietal many-seeded placentæ; style 1; stigma 2-lobed. Fruit capsular, inclosed within the withered corol, 1-celled, 2-valved, cach valve bearing 1 or 2 placentæ in the middle. Seeds indefinite, minute; embryo very minute, inverted at the apex of a fleshy albumen.

Herbs growing parasitically upon the roots of other species. Stems covered with brown or colourless scales.

1. OROBANCHE, Linn.

Calyx 4—5-cleft; segments often unequal. Corol ringent. Capsule ovate, acute, 1-celled, 2-valved. Seeds numerous. A gland beneath the base of the germ.

Didynamia. Angiospermia.

1. O. americana Linn.: stem very simple, covered with ovate-lance-olate imbricate scales; spike terminal, smooth; corol recurved; stamens exserted.

Hab. Woods. Car. to Geor. July. 21.—Stem 6—8 inches high, thick, leafless, scaly. Flowers in a terminal spike covered by the scales of the stem, brownish-yellow. Parasitic.

Cancer-root.

2. O. uniflora Linn.: stem very short; peduncles elongated, scapiform, 1-flowered, naked; scales smooth, concave; lobes of the corol oblong-oval, with a pubescent coloured margin.

Hab. Woods. Can. to Car. W. to Miss. May—July. 21— Peduncles 4—6 inches long, subpubescent. Flowers recurved,

bluish-white.-Parasitic.

2. EPIPHAGUS. Nutt.

Polygamous. Calyx abbreviated, 5-toothed. Corol of the sterile flower ringent, compressed, 4-cleft, lower lip flat; of the fertile flower minute 4-toothed, deciduous. Capsule truncate, oblique, 1-celled, imperfectly 2-valved, opening only on one side.

Didynamia. Angiospermia.

E. americanus Nutt. - Orobanche virginiana Linn.

Hab. Woods. Can. to Car. July—Sept. 21.—Stem a foot high, branched, leafless, with small ovate scales. Flowers alter-

nate, distinct, small; fertile ones deciduous; sterile ones larger, white striped with purple.—Parasitic.

Beech-drops.

ORDER LXXXIX, SCROPHULARINEÆ. Juss. Lind.

Calyx divided, unequal, persistent. Corol usually irregular and bilabiate, or personate, deciduous; æstivation imbricate. Stamens usually 4, didynamous, rarely equal, sometimes 2. Ovary free, 2-celled; ovules definite or indefinite; style simple; stigma 2-lobed, rarely entire. Fruit capsular, rarely fleshy, 2-rarely 1-celled, 2—4-valved; the valves entire or bifid, with a dissepiment either double from the inflexed margin of the valves, or simple parallel and entire, or opposite and bipartible. Placenta central, either adhering to the dissepiment or separating from it. Seeds indefinite; embryo straight, included within a fleshy albumen.

Herbs, seldom shrubs. Leaves usually opposite.

DIV. I. VERONICEE.

1. VERONICA. Linn.

Calyx 4- rarely 5-parted. Corol subrotate, 4-lobed, unequal, the lower segments narrower. Stamens 2, antheriferous, sterile ones none. Capsule 2-celled, obcordate. Seeds few. Diandria. Monogynia.

* Spikes or racemes terminal.

1. V. serpyllifolia Linn.: racemes spiked, many-flowered; leaves ovate, slightly crenate; capsule broadly obcordate.

Hab. Meadows, &c. Throughout the U.S. May to Aug. 21.

—Stems procumbent, 3—5 inches long, sometimes creeping.

Flowers small, pale blue, in a long spike or raceme. Introduced.

Thyme-leaved Speedwell.

** Spikes or racemes axillary.

- 2. V. scutellata Linn.: racemes alternate; pedicels divaricate; leaves linear, dentate-serrate.
 - Hab. Moist places. N. S. W. to Miss. May. 21.—Stem erect, weak, 6—12 inches high. Flowers flesh-coloured, in simple rarely compound racemes. Introduced. Scull-cap Speedwell.
- 3. V. anagallis Linn.: racemes opposite; leaves lanceolate, serrate; stem erect.
 - HAB. Ditches and moist places. Can. to Car. June—Aug. 21.—Stem 1—2 feet high, succulent. Leaves varying in width. Flowers blue, in long racemes. Pedicels shorter than in the preceding, but never deflexed. Water Speedwell.

4. V. beecabunga Linn.: racemes opposite; leaves elliptical, obtuse, subserrate, glabrous, on short petioles; stem procumbent, rooting at base.

HAB. Ditches, &c. N. S. June. 21.—Whole plant smooth and shining. Racemes many-flowered, longer than the leaves. Flowers bright blue. Brooklime.

5. V. officinalis Linn.: flowers in spikes; leaves ovate or obovate, serrate, shortly petiolate, rough, pubescent; stem procumbent, rough.

HAB. Pastures and dry woods. Can. to Car. June. 21.—Stems 6—12 inches long, rooting below. Flowers pale blue, in erect pedunculate spikes. Common Speedwell.

*** Flowers axillary, solitary.

- 6. V. agrestis Linn.: flowers peduncled; leaves on short petioles, cordate-ovate, deeply serrate; segments of the calyx ovate-lanceolate; stem procumbent.
 - HAB. Sandy fields. Can. to Car. May. . Stems 3—9 inches long, hairy. Peduneles rather longer than the leaves and recurved when in fruit. Flowers small, pale blue or whitish. Introduced.
- 7. V. peregrina Linn.: flowers solitary, sessile; leaves oblong, serrate, rather obtuse; stem erect.—V. caroliniana Walt.—V. marilandica Mich.
 - Hab. Clay grounds. Arctic Amer. to Car. W. to Miss. May, July. ©.—Whole plant smooth. Stem simple, or branched only at base. Flowers very small, white or pale blue, nearly or quite sessile.
- 8. V. arrensis Linn.: flowers subsessile; leaves cordate-ovate, deeply serrate, floral ones lanceolate; segments of the calyx lanceolate; stem nearly erect.
 - Hab. Fields, &c. Penn. to Car. April—July. Q.—Stem somewhat branched at base. Flowers nearly sessile, very small, pale blue. Capsule compressed and ciliate. Introduced.

Small Speedwell.

- 9. V. hederifolia Linn.: leaves cordate-ovate, mostly 5-lobed, petioled; segments of the calyx cordate, ciliate, acute; stem procumbent.
 - IIAB. Shady rocks. N. S. April. @.—Stems weak and unbranched. Corol pale blue, smaller than the calyx. Capsule 2-lobed, turgid.
- 10. V. reniformis Raf.: stem procumbent, hispid; leaves sessile, reniform, entire, hairy, villous; flowers axillary, solitary, subsessile.
 - HAR. Sandy soils. N. J. Raf. May—July. . S.—Stems few, terete, procumbent. Flowers white or pale blue.—It should not be confounded with V. reniformis of Pursh. It may be only a variety of V. arvensis.

2. LEPTANDRA. Nutt.

Calyx 5-parted; segments acuminate. Corol tubular-

campanulate; border 4-lobed, a little ringent, the lower segment narrower. Stamens 2, and with the pistil at length much exserted. Capsule ovate, acuminate, 2-celled, many-seeded, opening at the summit. Diandria. Monogynia.

L. virginica Nutt.: leaves whorled in fours or fives, lanceolate, serrate, petiolate.—Veronica virginica Linn.—Callistachya virginica Raf.

HAB. Woods. Can. to Car. W. to Miss. July, Aug. 21.—
Stem angular, 2—4 feet high, smooth, simple. Leaves in whorls, slightly pubescent beneath. Flowers white, in long dense terminal spikes.

DIV. H. ERINACEÆ.

3. BUCHNERA. Linn.

Calyx 5-toothed. Corol with the tube slender; border 5-cleft and nearly equal; lobes cordate. Capsule 2-celled.

Didynamia. Angiospermia.

B. americana Linn: stem simple; leaves lanceolate, subdentate, rough, 3-nerved; spikes with the flowers remote.

HAB. Sandy places. N. Y. to Car. W. to Miss. July. 24.—
Stem 12—18 inches high. Leaves opposite, sessile. Flowers
blue.—Plant blackens by drying.
Blue Hearts.

DIV. III. - SCROPHULARIEÆ.

4. SCROPHULARIA. Linn.

Calyx 5-cleft. Corol subglobose; limb contracted, shortly 2-lipped; upper lip 2-lobed (with a scale or abortive stamen frequently within); lower 3-lobed. Capsule 2-celled.

Didynamia. Angiospermia.

1. S. marylandica Linn.: leaves cordate, serrate, acute, rounded at the base; petioles fringed near the base; branches of the panicle composed of loosely flowered clusters.—S. nodosa var. americana Mich.

Hab. Low grounds. Can. to Car. W. to Miss. June, July. 21.—Stem 3—4 feet high, much branched. Leaves opposite. Flowers greenish-brown, small, in an erect compound terminal panicle. Capsule globular. Figurort.

2. S. lanccolate Pursh: leaves lanceolate, unequally and incisely serrate, acute at the base; petioles naked; fascicles of the panicle corymbed.

HAB. Wet meadows. N. S. Aug. 21.—Stem 2-3 feet high.

Flowers greenish-yellow.

5. ANTIRRHINUM. Linn.

Calyx 5-parted. Corol personate, with a deflexed promi-

nence or spur at the base. Capsule 2-celled, opening at the extremity with minute valves. Didynamia. Angiospermia.

1. A. elatine Linn.: procumbent, hairy; leaves alternate, hastate, very entire; peduncles solitary, axillary, very long.

HAB. Sandy fields. N. Y. to Virg. July. O.—Stem 1—2 feet

long. Flowers small, bluish-white. Introduced.?

2. A. linaria Linn.: stem erect; leaves linear-lanceolate, scattered, crowded; spikes terminal; flowers imbricate; calyx smooth, shorter than the spur.

HAB. Road sides. N. S. June—Oct. 21.—Stems 1—2 feet high. Flowers large, yellow, in long spikes. Introduced.?

Snap-dragon. Toad Flax.

3. A. canadense Linn.: assurgent, smooth, mostly simple; leaves scattered, erect, linear, obtuse; flowers in racemes; suckers (or sterile branches) procumbent.

6. MIMULUS. Linn.

Calyx prismatic, 5-toothed. Corol ringent; upper lip reflexed at the sides; palate of the lower lip prominent. Stigma thick, bifid. Capsule 2-celled, many-seeded. Seeds minute.

Didynamia. Angiospermia.

1. M. ringens Linn.: erect, smooth; leaves sessile, lanceolate, acuminate, serrate; peduncles axillary, opposite, longer than the flower; teeth of the calyx oblong, acuminate.

Hab. Wet grounds. Can. to Car. W. to Miss. Aug. 24.—
Stem 2 feet high, angular. Flowers large, pale purple.

Monkey Flower.

2. M. alatus Linn.: erect, smooth; leaves petioled, ovate, acuminate, serrate; peduncles axillary, opposite, shorter than the flower; teeth of the calyx round, mucronate; stem square, winged.

Hab. Wet meadows. N. Y. to Car. Aug. 21.—Stem 2 feet high, winged. Flowers pale blue.—Abundant in the western part of New-York. Distinguished from the former by its larger

and petiolate leaves and winged stem.

7. GRATIOLA. Linn.

Calyx 5-parted, often with 2 bracts at the base. Corol tubular, sub-bilabiate; upper lip emarginate; lower 3-lobed, Stamens 4, 2 sterile. Stigma 2-lobed. Capsule ovate, 2celled, 2-valved.

Diandria. Monogynia.

1. G. aurea Muhl.: smooth; leaves linear-oblong, subclasping, obscurely toothed; segments of the calyx equal; sterile filaments minute.—G. officinalis Mich.—G. carolinicusis Pcrs.

- Hab. Sandy swamps. N., Y. to Car. Aug. 24.—Stem 1—2 feet long, rooting at base. Flowers bright yellow, on axillary peduncles.

 Hedge Hyssop.
- 2. G. virginica Linn.: stem pubescent, assurgent, terete; leaves smooth, lanceolate, sparingly dentate-serrate, attenuate and connate at the base; segments of the calyx equal.

HAB. Inundated meadows. Can. to Car. W. to Miss. July.

Aug. 21.—Stem 6 inches high, branched at base. Peduncles

shorter or longer than the leaves; upper ones opposite. Flowers yellowish white.

3. G. megalocarpa Ell.: leaves lanceolate, serrate, pubescent; peduncles opposite, longer than the leaves; segments of the calyx linear, as long as the globose capsule.—G. acuminata Pursh. (excl. syn.)

HAB. Ditches and pools. Penn. to Car. July—Aug. 21.—Flowers pale-yellow, large. Capsule larger than in any other species.

8. LINDERNIA. Linn.

Calyx 5-parted. Corol tubular, ringent; upper lip short, emarginate; lower one trifid, unequal. Filaments 4; 2 longer, forked and sterile. Stigma emarginate. Capsule 2-celled, 2-valved; dissepiment parallel with the valves.

Diandria. Monogynia.

- 1. L. dilatata Muhl.: leaves dilated at the base, clasping, remotely toothed; peduncles longer than the leaves.—L. pyxidaria Pursh.—Gratiola anagalloidea Mich.
 - HAR. Inundated banks. N. Y. to Car. July, Aug. . . —Stem 6 inches high, 4-sided, smooth. Flowers pale purple, on alternate and opposite peduncles.
- 2. L. attenuata Muhl.: leaves lanceolate and obovate, narrowed at the base; peduncles shorter than the leaves, erect.—L. pyxidaria var. major Pursh.

Hab. Inundated banks. N. Y. to Car. July—Sept. ...—Stemerect or procumbent. Peduneles shorter or nearly as long as the leaves.

3. L. monticola Muhl.: stem slender, dichotomous; radical leaves spathulate; cauline ones linear, small and remote; peduncles very long, at length deflected.

HAB. White Hills, N. H. June. 21.—Stem erect, 4—6 inches high. Radical leaves obscurely toothed, punctate; cauline ones

very few. Flowers pale blue.

9. SCHWALBEA. Linn.

Calyx ventricose, tubular, obliquely 4-cleft; upper segment shortest; the lower large, emarginate or bidentate. Corol bilabiate; upper lip entire, arched; the lower 3-lobed. Capsule ovate-roundish, 2-celled, 2-valved; dissepiment produced by the inflected margin of the valves, and parallel with

the longitudinal receptacle. Seeds numerous, imbricated, linear and winged. Didynamia. Angiospermia.

S. americana Linn.

HAB. Pine barrens. N. J. to Car. Aug., Sept. 21.—Stem
12—18 inches high, simple, pubescent. Leaves alternate, lanceolate, entire, somewhat 3-nerved. Flowers in a terminal raceme, alternate, subsessile, dark purple.

10. CHELONE. Linn.

Calyx 5-parted, with 3 bracts. Corol ringent, ventricose. Sterile filaments shorter than the rest; anthers woolly. Capsule 2-celled, 2-valved. Seeds membranaceously margined.

Didynamia. Angiospermia.

C. glabra Linn.: smooth; leaves opposite, oblong, lanceolate, acuminate, serrate; flowers in dense spikes.

HAB. Wet grounds. Can. to Car. Aug.—Oct. 21.—Stem 2 feet high, simple. Flowers large, white or reddish, in a compact terminal spike.

Snake-head.

11. PENTSTEMON. Linn.

Calyx 5-leaved. Corol bilabiate, ventricose. The fifth sterile filament longer than the rest and bearded on the upper side. Anthers smooth. Capsule ovate, 2-celled, 2-valved. Seeds numerous, angular. Didynamia. Angiospermia.

1. P. læxigatum Linn.: smooth; leaves ovate-oblong, clasping at base, slightly toothed, the lower ones entire; flowers paniculate; sterile filament bearded near the top.—Chelone pentstemon Walt.

Hab. Low grounds. • Penn. to Car. June. 21.—Stem 1—2 feet high. Flowers in terminal panicles.

2. P. pubescens Linn.: stem pubescent; leaves serrulate, lanceolateoblong, sessile, clasping; flowers in panicles; sterile filament bearded from the top below the middle.

Hab. Hill sides. Can. to Geor. W. to Miss. June. 24.— Stem 18 inches high. Florers pale purple, in terminal panicles.

12. HERPESTIS. Gaert.

Calyx 5-cleft, unequal, bibractate at base. Corol tubular, sub-bilabiate. Stamens included, all fertile. Capsule 2-celled, 2-valved; dissepiment parallel to the valves.

Didynamia. Angiospermia.

H. cuncifolia Pursh: very smooth; leaves cuneate-obovate, obscurely crenate near the summit; peduncles as long as the leaves; corol 5-cleft.—Monnicra cuncifolia Mich.

HAB. Inundated banks. Penn. to Car. Aug. 21.-Stem pros-

trate, creeping. Leaves opposite, thick, somewhat clasping. Flowers very small, pale purple, solitary, axillary.

13. HEMIANTHUS. Nutt.

Calyx tubular, cleft on the under side; border 4-toothed. Corol with the upper lip obsolete; the lower 3-parted; intermediate segment ligulate and truncate, much longer, closely incurved. Stamens 2; filaments bifid, lateral fork antheriferous. Style bifid. Capsule 1-celled, 2-valved, many-seeded.

Diandria. Monogynia.

II. micranthemoides Nutt.—Herpestis micrantha Pursh. (excl. syn.)
 HAB. Inundated banks. Del. Aug., Sept. O.—Stem creeping, dichotomous. Leaves opposite, crowded, sessile, obscurely 3-nerved. Flowers axillary, solitary, minute.

14. COLLINSIA. Nutt.

Calyx 5-cleft. Corol bilabiate, orifice closed; upper lip bifid; the lower trifid; intermediate segment carinately saccate and closed over the declinate style and stamens. Capsule globose, partly 1-celled and imperfectly 4-valved. Seeds 2—3, umbilicate.

Didynamia. Angiospermia.

C. verna Nutt.: leaves ovate-oblong, sessile, obtuse, the lower ones attenuated into a long petiole; peduncles axillary, long.

HAB. Banks of streams. N. Y. W. to Miss. July. . Stem a foot high. Leaves opposite. Peduncles axillary, 1-flowered. Flowers particoloured.—Very abundant about Utica, N.Y. Gray.

15. LIMOSELLA. Linn.

Calyx 5-cleft. Corol shortly campanulate, 5-cleft, equal. Stamens approximating by pairs. Capsule 2-valved, sub-bilocular, many seeded. Dydynamia. Angiospermia.

L. subulata Ices: leaves linear, very narrow, scarcely dilated at the apex; scape 1-flowered, as long as the leaves.

Hab. Muddy shores. N.S. Aug. 21.—Stem an inch high. Flowers very small, bluish-white.

Mudwort.

16. GERARDIA. Linn.

Calyx half 5-cleft or 5-toothed. Corol subcampanulate, unequally 5-lobed; segments mostly rounded. Capsule 2-celled, opening at the summit. Didynamia. Angiospermia.

* Flowers purple.

1. G. purpurea Linn.: stem angular, much branched; leaves linear, long, acute at each end, very scabrous; flowers nearly sessile; teeth of the calyx subulate, short, acute.

- IIAB. Fields and woods. N. Y. to Car. Aug.—Oct. Q.—Stem 1—2 feet high, slender, much branched. Flowers large, axillary, purple.
- 2. G. tenuifolia Linn.: stem much branched, smooth; leaves linear, acute at each end, smooth, rough; peduncles axillary, opposite, longer than the flowers; teeth of the calyx, small, acute.—G. erceta Walt.
 - Hab. Fields and woods. N.Y. to Car. W. to Miss. July—Sept. ©.—Stem 6—10 inches high, much branched small, purple.—Differs from the former in its corol and peduncle.
- 3. G. maritima Raf.: stem angular; leaves linear, fleshy, short, rather obtuse; flowers pedunculate; upper segments of the corol ciliate; calyx truncate, with minute teeth.—G. purpurea var. crassifolia Pursh.
 - HAB. Salt marshes. N. S. July—Sept. ♥.—Stem 6-12 inches high. Flowers middle-sized, purple, axillary and terminal.— Easily distinguished by its truncate calyx.
- 3. C. auriculata Mich.: subsimple, scabrous; leaves ovate, lanceolate, auriculate at the base, very entire, sessile; flowers sessile, axillary.

Hab. Rocky fields. Penn. W. to Ill. Aug. @.—Stem 8—12 inches high. Flowers middle-sized.

** Flowers yellow.

5. G. flava Linn.: pubescent; stem mostly simple; leaves lanceolate, entire or toothed, the lower ones notched and pinnatifid; flowers axillary, opposite, nearly sessile.

HAB. Rocky woods. N. Y. to Flor. W. to Miss. Aug.—Sept. 21.-Stem 2—3 feet high. Flowers large, yellow. False Foxglove.

6. G. glauca Eddy: smooth; stem panicled; leaves petioled, pinnatifid, paler beneath; the upper ones lanceolate; flowers axillary, opposite, on pedicels.—G. quereifolia Pursh.

Hab. Woods. N. Y. to Car. W. to Miss. Aug., Sept. 21.
—Stem 3—5 feet high. Flowers large, yellow.—Resembles the preceding, but has the stem smooth and more branched, the leaves petioled and pinnatifid, and the flowers on pedicels.

7. G. pedicularia Linn.: stem much branched, villous; leaves oblong, smoothish, pinnatifid; segments uncinate, serrate; flowers axillary, opposite, on pedicels; segments of the calyx leafy, notched and toothed.

Hab. Woods. Can. to Car. July, Aug. 21.—Stem 2-3 feet high, much branched. Flowers large, villous on the outside.— Liable to much variation.

DIV. IV. RHINANTHEE. 17. RHINANTHUS. Linn.

Calyx inflated, 4-toothed. Corol ringent; upper lip com-

pressed; lower one flat, 3-lobed. Capsule 2-celled, obtuse, compressed. Didynamia. Angiospermia.

R. crista galli Linn.: upper lip of the corol arched; calyx smooth; leaves lanceolate, serrate.

Hab. Meadows. Arc. Amer. Can. N. Y. and Mass. June, July. ©.—Stem a foot high, branching. Leaves opposite, cordate, lanceolate. Flowers axillary, but somewhat spiked, yellow. Calyx becoming very large after flowering. Yellow Rattle.

18. PEDICULARIS. Linn.

Calyx ventricose, half 5-cleft. Corol with the upper lip emarginate and compressed. Capsule 2-celled, mucronate, oblique. Seeds angular, coated.

Didynamia. Angiospermia.

1. P. pallida Pursh: stem smooth, branched, with pubescent lines; leaves subopposite, lanceolate, pinnatifid, toothed and crenate, scabrous on the margin; helmet of the corol truncated at the apex; calyx bifid with round segments—and P. lanceolata Mich.

HAB. Low grounds. N. Y. to Virg. W. to Miss. Sept. 21.
—Stem 1—2 feet high. Flowers large, straw yellow. Capsule

short and broad-ovate.

2. P. canadensis Linn.: stem simple; leaves pinnatifid, notched and toothed; spike leafy at the base, hairy; helmet of the corol with 2 setaceous teeth; calyx obliquely truncate.

HAB. Meadows. Can. to Car. W. to Miss. May—July. 21.
—Stem 8—10 inches high. Flowers yellow and purple, in a short terminal spike.
Louse-wort.

3. P. gladiata Mich.: stem simple; leaves lanceolate, pinnatifid, toothed; spikes leafy, hairy, with the flowers alternate; capsule terminating in a long flat point.

HAB. Wet meadows. N. Y. to Virg. May, June. 21.-Stem

a foot high. Flowers yellow and purple.

19. EUPHRASIA. Linn.

Calyx tubular, 4-cleft. Corol bilabiate; upper lip bifid; lower one of 3 notched lobes. Anthers with their lobes mucronate at base. Capsule ovate-oblong, 2-celled. Seeds striate.

Didynamia. Angiospermia.

E. officinalis Linn.: leaves ovate, deeply toothed, furrowed; flowers axillary towards the summit; calyx 4-toothed, hairy; segments of the lower lip of the corol emarginate.

Hab. Can. Mich. Arctic Amer. Rich. July—Sept. Eye-bright.

20. BARTSIA. Linn.

Calyx 4-cleft, mostly coloured. Corol ringent, with a contracted orifice; upper lip concave, longest, entire; lower one in 3 equal reflexed lobes. Capsule ovate, compressed, 2-celled, many-seeded. Seeds angular.

Didynamia. Angiospermia.

B. pallida Mich.: leaves alternate, linear, undivided, 3-nerved; upper ones lanceolate; floral ones sulcate, toothed at the end; teeth of the calyx entire, acute.

Hab. Mountains. N. H. Can. and Labrador. Aug. 21.—Stem
 12 inches high. Flowers yellow, pubescent; floral ones purple.
 —Sprengel has removed this species to the genus Castelleja of

Mutis.

21. EUCHROMA. Nutt.

Calyx ventricose, 2—4-cleft. Corol bilabiate; upper lip very long and linear, embracing the style and stamens; lower lip short and trifid, without glands. Anthers linear, with unequal lobes, all cohering in the form of an oblong disk. Capsule compressed, ovate, oblique, 2-celled, 2-valved. Seeds numerous, small, surrounded by a membranaceous inflated vesicle.

Didynamia. Angiospermia.

E. coccinca Nutt.: leaves and coloured bracts pinnatifidly 3-cleft; segments divaricate; calyx 2-cleft, nearly as long as the corol; segments retuse and emarginate.—Bartsia coccinea Linn.

Hab. Wet grounds. Can. to Flor. W. to Miss. May, June. 21.—Stem 8—12 inches high. Bracts scarlet. Corol yellow.

Painted-cup.

22. MELAMPYRUM. Linn.

Calyx 4-cleft. Upper lip of the corol compressed, margin folded back; lower lip grooved, trifid, subequal. Capsule 2-celled, oblique, opening on one side; cells 2-seeded. Seeds cartilaginous, cylindric-oblong. Didynamia. Angiospermia.

M. americanum Mich.: lower leaves lanceolate or linear-lanceolate; floral ones lanceolate, toothed at the base; flowers axillary, distinct.

—M. lineare, Lam. and M. latifolium Muhl.

HAB. Woods. Can. to Car. June, July. Q.—Stem 8—12 inches high, branched at the upper part. Flowers yellow.—It varies considerably in the form of the leaves.

Cow Wheat.

ORDER XC. LABIATÆ. Juss. Lind.

Calyx tubular, regular or bilabiate, persistent. Corol bilabiate; upper lip entire or bifid, the lower 3-cleft; the upper

in astivation overlapping the lower. Stamens 4, didynamous, (2 being sometimes abortive,) inserted on the corol, alternate with the lobes of the lower lip; anthers 2-celled, sometimes apparently 1-celled, either by the obliteration of the septum or by the abortion of a cell. Ovary free, deeply 4-lobed; oxules 4; style 1, proceeding from the base of the lobes; stigma bifid, usually acute, sometimes unequal or dilated. Fruit 1-4 small nuts, enclosed within the persistent calyx. Seeds erect, with little or no albumen: embryo erect: cotyledons flat.

Herbs or undershrubs with square stems and opposite branches. Leaves opposite, without stipules.

DIV. I. MENTHOIDE E.

1. LYCOPUS. Linn.

Calyx tubular, 5-cleft, mouth naked. Corol tubular, nearly equal, 4-lobed; upper segments broader and notched. Stamens 2, distant, simple. Diandria. Monogynia.

1. L. europaus Linn.: leaves narrow, lanceolate, serrate; calyx 5cleft with the segments acuminate, longer than the seed .- L. americanus Muhl.-L. europaus var. angustifolius Torr.

HAB. Moist places. N. Y. to Car. Aug. 21.—Stem erect. 1—2 feet high, square. Lewes opposite, upper ones slightly, lower ones deeply toothed. Flowers in dense whorls, white. Calyx with spines, longer than the seed. Water Horehound.

2. L. virginicus Linn. : leaves broad-lanceolate, serrate, tapering and entire at the base; calyx shorter than the seed, spineless.

Hab. Wet places. Can. to Car. W. to Rocky Mountains. June—Aug. 21.—Stem pubescent. Leaves opposite, sessile, variously toothed. Flowers in small whorls. Catyx unarmed.—Formerly in high reputation as a remedy in hæmoptysis.

Bugle Weed.

3. L. uniflorus Mich.: plant small; root tuberous; stem simple; leaves oval, obtuse, obsoletely toothed; axils 1-flowered.

Hab. Penn. Muhl. Aug. 21.—Root tuberous; suckers procumbent, leafy. Stem about 3 inches high, rather smooth. Leaves on petioles, with few teeth. Flowers axillary, solitary. Mich. - An obscure species, perhaps only a variety of the form-

2. ISANTHUS. Mich.

Calyx subcampanulate. Corol 5-parted; tube straight and narrow; segments of the border ovate and equal. Stamens subequal. Stigma linear, recurved .-

Didynamia. Gymnospermia.

I. caruleus Mich.

Hab. River banks. N. Y. to Virg. W. to Miss. July, Aug. —Plant viscidly pubescent, a foot high. Leaves oval-lanceolate, acute at both ends, 3-nerved. Flowers rale blue, 1—2 on axillary peduncles.

3. MENTHA. Linn.

Corol nearly regular, 5-lobed; the broadest lobe notched. Stamens erect, distant. Didynamia. Gymnospermia.

* Flowers in a spike.

1. M. piperita Linn.: spikes obtuse, interrupted below; leaves ovate, subglabrous, petiolate; calyx very smooth at the base.

HAB. Marshy grounds near Salina, N. Y.; apparently native.
July. 21.—Stem 12—15 inches high, erect, often purplish.

Leaves varying in form from cordate-ovate to ovate-lanceolate.

Flowers purple.

Peppermint.

2. M. viridis Walt.: spikes interrupted; leaves subsessile, lanceolate-ovate, smooth; bracts setaceous, and with the teeth of the calyx somewhat hairy; stamens not exserted.—M. tenuis Mich.

HAB. Wet grounds. N. Y. to Geor. July, Aug. 2f.—Stem 12—18 inches high. Flowers pale purple, in a long spike consisting of remote whorls. Spearmint.

** Flowers whorled.

3. M. canadense Linn.: flowers whorled; leaves lanceolate, serrate, petioled, hairy; stamens as long as the corol.

Hab. Sandy soils. Can. and N. S. W. to Miss. Aug., Sept. 21.—Stem a foot high. Flowers in axillary whorls, pale purple.

4. M. borcalis Mich.: ascending, pubescent; leaves petioled, ovatelanceolate, acute at both ends; flowers in whorls; stamens exsert.

Hab. Moist grounds. Can. and N.S. July, Aug. 21.—Stem
 1-2 feet high. Flowers white or pale purple. Stamens twice as long as the corol.—Perhaps not distinct from the preceding.

DIV. II. SATUREINEÆ.

4. PYCNANTHEMUM. Mich.

Heads of flowers surrounded by an involucre of many bracts. Calyx tubular, striate, 5-toothed. Corol with the upper lip nearly entire, the lower one trifid; middle segment longer. Stamens distant; cells of the anthers parallel.

Didynamia. Gymnospermia.

* Stamens exserted.

1. P. incanum Mich.: leaves oblong-ovate, shortly petiolate, acute, subserrate, hoary-tomentose; heads of flowers pedunculate, compound, lateral and terminal; bracts setaceous.—Clinopodium incanum Linn.

- IIAB. Low fields. N.Y. to Car. July—Sept. 24.—Stem 2—3 feet high, whitish. Flowers pale red, in dense lateral and terminal heads or whorls.—Whole plant covered with white soft down.
 Wild Basil.
- 2. P. aristatum Mich.: leaves lanceolate-ovate, subserrate, on very short petioles, whitish; heads sessile; bracts awned.—Nepeta virginica Linn.
 - HAB. Woods. Md. to Car. W. to Tenn. July, Aug. 24.—Stem 1—2 feet high. Upper leaves hoary. Flowers very small, white, in one or two sessile whorls and a terminal head. Bracts and calyx terminated by long awns.
- 3. P. linifolium Pursh: stem straight, much branched, somewhat scabrous; leaves linear, 3-nerved, very entire, smooth; heads terminal, in a fasciculate corymb—Brachystemum virginicum Mich.—B. linifolium Willd.
 - Hab. Woods. N. Y. to Car. W. to Miss. July, Aug. 24.— Stem 12—18 inches high, with trichotomous fastigiate branches. Flowers white, minute, spotted internally. Virginian Thyme.

** Stamens included.

- 4. P. lanceolatum Pursh: stem straight, branched, somewhat rough; leaves linear-lanceolate, subsessile, very entire, veined; heads terminal, sessile, in fascicled corymbs.—P. virginicum.—Brachystcmum lanceolatum Willd.
 - HAB. Hills. Penn. to Car. July, Aug. 24-Stem 2 feet high. Flowers minute, white, in heads which form irregular corymbs.
- 5. P. muticum Pers.: leaves ovate-lanceolate, subdentate, smoothish; heads terminal; bracts lanceolate, somewhat acute.—Brachystemum muticum Mich.
 - Hab. Rocky hills. Penn. to Geor. July, Aug. 24.—Stem 2, feet high. Leaves large. Flowers whitish, small, in loosely flowered heads.
- 6. P. verticillatum Pcrs.: leaves ovate-lanceolate, sometimes toothed: whorls sessile, compact; bracts acuminate.—Brachystemum verticillatum Mich.
 - Hab. Mountains. Penn. to Car. July, Aug. 2f.—Stem 2 feet high, very pubescent when young. Flowers small, white.

5. THYMUS. Linn.

Calyx subcampanulate, orifice closed with villous hairs.

Corol shortly 2-lipped; upper one notched; the lower one the largest, submarginate.

Didynamia. Gymnospermia.

T. serpyllum Linn.: stems branched, decumbent; leaves flat, ovate, obtuse, entire, betioled, more or less ciliate at base; flowers capitate.

Hab. Fields. Penn.; naturalized. Nutt. July, Aug. 21.—Stem spreading. procumbent, branched. Leaves more or less hairy. Flowers purple or white, in heads, on short hairy pedicels.

Wild Thyme.

6. ORIGANUM. Linn.

Flowers collected into a 4-sided cone or dense spike. Upper lip of the corol erect, flat, emarginate; lower 3-parted.

Didynamia. Gymnospermia.

O. rulgare Linn.: spikes roundish, panicled, clustered, smooth; bracts ovate, longer than the calyx; leaves ovate, entire.

HAB. Rocky fields. N. S. July—Sept. 21.—Stems 8—12 inches high, hairy. Flowers purplish, in numerous small spikes which are crowded together so as to form a terminal head.

Marjoram.

7. HYSSOPUS. Linn.

Lower lip of the corol 3-parted; middle lobe subcrenate. Stamens straight and distant. Didynamia. Gymnospermia.

- 1. H. nepetoides Linn.: spike formed of whorls, cylindrical; leaves opposite, subcordate, ovate, acuminate, toothed; styles shorter than the corol.
 - Hab. Woods. N. Y. to Virg. W. to Miss. July. 2f.—Stem 3-6 feet high, pubescent. Flowers small, yellowish-white or pale purple. Calyx smooth, segments finear. Bracts dilated.
- 2. H. serophularifolius Linn.: spike formed of whorls, cylindrical; leaves cordate, ovate, acuminate, obtusely toothed; styles longer than the corol.
 - Hab. Wet woods. Penn. to Virg. W. to Ill. July, Aug. 24.
 —Stem 2 feet high. Flowers purple. Calyx smooth, segments subovate. Bracts ovate.—Closely resembles the former, but most probably distinct.

DIV. III. AJUGOIDEÆ.

8. TEUCRIUM. Linn.

Upper lip of the *corol* short, 2-parted; the lower one 3-lobed, the middle lobe the largest. Stamens projecting through the cleft in the upper lip.

Didynamia. Gymnospermia.

1. T. canadense Linn.: hoary-pubescent; leaves ovate-lanceolate, serrate, all petiolate; spike whorled, crowded, long; bracts longer than the calyx.

HAB. Low grounds. Can. to Car. W. to Miss. July, Aug. 24.

Stem 12—18 inches high, erect. Flowers purple, in a terminal whorled spike.

Wild Germander.

2. T. virginieum Linn.: pubescent; leaves ovate-oblong, serrate; the upper ones subsessile; spikes whorled, crowded; bracts as long as the calyx.

Hab. Low grounds. N. Y. to Car. W. to Miss. Aug. 21.—Resembles the preceding and is not perhaps specifically distinct.

9. TRICHOSTEMA. Linn.

Calyx resupinate. Upper lip of the corol falcate. Stamens very long and incurved. Didynamia. Gymnospermia.

1. T. dichotoma Linn.: leaves rhombic-lanceolate, pubescent; stamens very long.

HAB. Dry hills. N. Y. to Geor. W. to Miss. June—Aug. Stem 6—10 inches high. Flowers blue, in dichotomous panieles.
Blue Curls.

2. T. linearis Walt.: stem viscidly pubescent; leaves linear-smooth, sessile, acute at each end; teeth of the calyx awned; stamens very long.—T. dichotoma var. linearis Pursh.

Hab. Sandy fields. N. J. to Car. June—Sept. . —Resembles the former in habit, but is smaller. It is considered distinct by Nuttall and Elliott.

10. COLLINSONIA. Linn.

Calyx bilabiate, 3-toothed above, bifid below. Corol much longer than the calyx, somewhat funnel-form, unequally 5-lobed; lower lobe longer and fimbriate. Stamens 2—4.

Diandria. Monogynia.

C. canadensis Linn.: leaves broad-cordate-ovate, glabrous; teeth of the calyx short, subulate; paniele terminal, compound.

Hab. Woods. Can. to Car. July—Sept. 21.—Stem 2—3 feet high, smooth, 4-sided. Leaves opposite, large, acuminate, toothed. Flowers large, yellow. Horse Weed.

DIV. IV. MONARDEÆ.

11. MONARDA. Linn.

Calyx 5-toothed, cylindric, striate. Corol ringent, with a long cylindric tube; upper lip linear, nearly straight and entire, involving the filaments; lower lip reflexed, broader, 3-lobed, the middle lobe longer. Diandria. Monogynia.

- * Calyx with 5 equal teeth. Flowers in heads. Monarda. Raf.
- 1. M. didyma Linn.: nearly smooth; stem acute-angled, smooth; leaves broad-ovate or oblong, sometimes cordate, acuminate, mucronate, serrate, rugose, on hairy petioles, midrib and veins hairy beneath; heads of flowers large, often proliferous; bracts oblong, acuminate, nearly entire, coloured; calyx somewhat pubescent; corol large, pubescent.—M. purpurea Lam.—M. coccinca Mich.—M. kulmiana Pursh.
 - HAB. Swamps. Can. to Car. July, Aug. 24.—Stem 2—3 feet high, simple or branched at the top. Leaves varying from lanceolate to broad-ovate, sometimes attenuate at base; sometimes subcordate. Flowers scarlet or crimson, in large heads which are sometimes proliferous.—This species, like most of

the rest, is very variable. I have specimens from Whitesborough, N. Y., in which the leaves as are much attenuated at base as in Pursh's figure of M. kalmiana; but this is not a constant character, nor do I know of any by which that species can be distinguished.

Oswego Tea.

2. M. fistulosa Linn.: stem obtuse-angled, nearly smooth, hollow; leaves oblong-lanceolate, acuminate, coarsely serrate, thin and nearly smooth, on slightly pubescent petioles; heads simple or proliferous; outer bracts oblong, smooth; calyx long, curved, bearded; corol

rough, pale.

Hab. Rocky banks. N. Y. to Car. July, Aug. 21.—Stem 2 feet high, always simple. Leaves yellowish-green, petioled, 3-4 inches long and I broad, membranaceous, nearly smooth, coarsely toothed. Flowers pale yellow, in heads which are smaller than in the preceding; eorol pubescent.—When cultivated the leaves are often smaller, subcordate, ovate, and more hairy than in the native state. Abundant near Rochester, N. Y.

3. M. allophylla Mich.: stem obtuse-angled, branched and hairy above; leaves oblong-lanceolate, remotely toothed, smooth above, somewhat hairy beneath; heads simple; outer bracts ovate, acute, coloured; calyx short, densely bearded at the throat.—M. longifolia Lam.—M. mollis Pursh not of Linn.—M. oblongata Ait. Torr.

Hab. Rocky woods. N. Y. to Car. July. 2f.—Stem 3—4 feet high, much branched. Leaves often rounded at base, and with a few large teeth, varying in the degree of pubescence. Flowers in heads, about the size of the preceding, pale blue.—The habit is sufficiently characteristic of this species.

4. M. clinopodia Linn.: stem obtuse-angled, smooth; leaves ovate-lanceolate, remotely serrate, tapering at base, nearly smooth; heads simple; bracts broad-ovate, acute, entire, nearly smooth; calyx short,

ciliate; corol pubescent, slender. - M. glabra Linn.?

- Hab. Woods. Can. to Car. Pursh. July—Sept. 21.—Stem 3 feet high, obtuse-angled and nearly smooth. Leaves ovatelanceolate, tapering at base into a petiole, with a few serratures near the middle, punctate as in the preceding, whitish beneath, (closely resembling those of Clinopodium ineanum,) though apparently quite smooth. Flowers pale purple.—I am not sure that this is the plant described by Pursh under the above name, but I believe it to be the Linnæan one. It it cultivated at Albany, and in many respects much resembles the preceding, with which it may be hereafter united.
- ** Calyx with 5 unequal teeth. Flowers in whorls. Chellyctis. Rof.
- 5. M. punctata Linn.: nearly smooth; stem obtuse-angled, branched, white-downy; leaves lanceolate-oblong, remotely and obscurely serrate, smooth; flowers whorled; bracts lanceolate, coloured, longer than the whorl.—M. lutea Mich.
 - HAB. Pine barrens. N. J. to Car. W. to Miss. Sept. 21 and 3.—Stem 2—3 feet high, branched. Flowers in whorls; calyx long; corol yellow, dotted with brown. Bracts large, red and

yellow.—It contains an assential oil, which is sometimes employed medicinally. See Med. Recorder, ii. 294. Ref. Med. Bot. ii. 38.

Horse Mint.

- *** Calyx bilabiate; upper lip shorter bidentate; lower tridentate. Flowers in whorls. Blephilia. Raf.
- 6. M. hirsuta Parsh: whole plant hairy; leaves on long petioles, ovate, acuminate serrate, hirsute; flowers small, in whorls; bracts short, oblong, acuminate; calyx 2-lipped; upper lip of two short acuminate teeth; lower of three almost bristleform awns.—M. ciliata Mich.
 - Hab. Low woods. N. Y. to Car. W. to Miss. June, July. 21.—Stem 2—3 feet high, branched. Whorls 4 or 5 on the upper part of each branch. Corol small, pale blue, dotted with purple.

12. CUNILA. Linn.

Calyx cylindrical, 10-striate, 5-toothed. Corol ringent, with the upper lip erect, flat and emarginate. Stamens 2-sterile; the 2 fertile ones with the style exserted nearly twice the length of the corol. Stigma unequally bifid.

Diandria. Monogynia.

1. C. mariana Linn.: leaves ovate, serrate; corymb axillary and terminal, dichotomous.—Ziziphora mariana R. δ S.

HAB. On rocks. N. Y. to Car. W. to Arkansa. July, Aug. 21.—Stem 1—2 feet high, angled, much branched, purple. Leaves opposite, sessile, nearly cordate. Flowers pale red.

Dittany.

- 2. C. glabella Mieh.: smooth; stem surculose; radicle leaves nearly oval; stem leaves oblong-linear, all entire; flowers axillary, mostly solitary, on long peduncles.— $Hedeoma\ glabra\ Pers.$ — $Ziziphora\ glabella\ R.\ \&\ S.$
 - Hab. Limestone rocks. Niagara Falls. W. to Miss. Aug. 21.
 —Stem 8—10 inches high, branched below. Corol violet, much longer than the calyx.—Dr. Houghton has found this species at the Falls of St. Anthony.

DIV. V. NEPETEÆ.

13. GALEOPSIS. Linn.

Calyx 5-cleft, awned. Upper lip of the corol vaulted, subcrenate; lower lip with 3 unequal lobes, having 2 teeth on its upper side.

Didynamia. Gymnospermia.

1. G. ladanum Linn.: stem hairy, not swollen below the joints; leaves on short petioles, lanceolate, more or less serrate, hairy; flowers whorled; upper lip of the corol slightly crenate.

HAB. Waste grounds. N. S. July. . Stem a foot high,

branched. Flowers variegated with red and white. Calyx hairy. Red Hemp Nettle. Smaller than the next. Introduced.

2. G. tetrahit Linn.: stem hispid, swollen between the joints; leaves ovate, hispid, serrate; flowers numerous, in whorls; corol twice as long as the calyx.

HAB. Waste places. N. S. W. to Mich. July. @ .- Stem 1-2 feet high. Flowers rose coloured, with a white tube; lower

lip dotted with purple. Calyx hispid, the teeth pungent. In-Hemp Nettletroduced.

14. LEONURUS. Linn.

Calyx 5-angled, 5-toothed. Upper lip of the corol very hairy above, entire; lower one reflexed, 3-parted. Anthers Didynamia. Gymnospermia. sprinkled with shining dots.

L. cardiaca Linn. : leaves petiolate, pubescent, paler beneath ; cauline ones lanceolate, 3-lobed; upper ones entire; flowers in numerous whorls; corol downy on the upper lip; calyx stiff, becoming spiny.

HAB. Waste grounds. Can. to Car. July, Aug. 21 .- Stem 2-3 feet high, branched, villous. Flowers in crowded whorls, white with a reddish tinge. Introduced. Mothercort.

15. LAMIUM. Linn.

Calyx 5-toothed; the teeth acuminate, spreading. Upper lip of the corol vaulted, entire; lower one 2-lobed, toothed on each side at the base. Anthers hairy.

Didynamia. Gymnospermia.

L. amplexicaule Linn. : floral leaves broadly cordate, sessile, clasping, crenate or cut; lower ones petiolate.

HAB. Fields and road sides. N. S. May-Nov. Q .- Stem 6-8 inches high. Flowers with the tube slender, rose coloured. Dead Nettle. Introduced.?

16. DRACOCEPHALUM. Linn.

Calyx subequal, 5-cleft. Orifice of the corol inflated; upper lip concave. Stamens unconnected.

Didynamia. Gymnospermia.

1. D. rirginianum Linn. : spikes long, with the flowers crowded; bracts small, subulate; teeth of the calyx short, nearly equal; leaves sessile, opposite, linear-lanceolate, acutely serrate.

HAB. Mountain meadows. N. Y. to Car. W. to Michigan. June. 24.—Stem 1—2 feet high, smooth except at the summit. Flowers large, bright purple, generally opposite, in terminal spikes.—Dr. Houghton has found this species as far west as Red Cedar River.

2. D. denticulatum Linn.: spikes long, with the flowers distant:

bracts small, subulate; teeth of the calyx nearly equal; leaves sessile, ovate-lanceolate, slightly toothed.—Prasium purpurcum Walt.

HAB. Mountains. Penn. to Car. June. 24.—Stem a foot high, smooth. Flowers purple, variegated on the lower lip.—Smaller than the preceding.

17. STACHYS: Linn.

Calyx 5-cleft, awned. Upper lip of the corol vaulted; lower one 3-lobed, with the 2 lateral lobes reflexed. Stamens when old bent downwards.

Didynamia. Gymnospermia.

1. S. hyssopifolia Mich.: scarcely pubescent, slender, erect; leaves sessile, linear-lanceolate, remotely subdentate; whorls about 4-flowered.—S. palustris Walt.

HAB. Meadows. N. Y. to Car. July. 21.—Stem 6—12 inches high. Leaves often linear, very finely serrulate. Flowers sessile. Calyx with the teeth almost spinous. Corol a little hairy, purple.—This plant has been found a few miles east of this city.

2. S. aspera Mich.: stem erect, angles hairy backwards; leaves subpetiolate, lanceolate, acutely serrate, very smooth; whorls about 6-flowered; calyx teeth divaricate, spiny.—S. arvensis Walt.

HAB. Fields. Can. to Car. W. to Miss. July. 2f.—Stem a foot high. Flowers in whorls, forming a terminal leafy spike, purple.
Hedge Nettle.

3. S. sylvatica Nutt.: leaves shortly petiolate, cordate, ovate, acuminate, serrate, hairy; floral ones nearly linear; whorls of 6 flowers; calyx hairy, with 5 acute teeth.—S. hispida Pursh.

Hab. Woods. Can. to Car. W. to Miss. Aug. 2f.—Stem 1—2 feet high, erect, hairy. Flowers purple; lower lip of the corol whitish with dark spots.—Fetid.

18. NEPETA. Linn.

Calyx arid, straight. Upper lip of the corol notched; lower one 3-lobed; the middle lobe the largest and crenate; lateral ones very short, reflexed. Didynamia. Gymnospermia.

N. cataria Linn.: flowers spiked; whorls slightly pedunculate; leaves petioled, cordate, dentate-serrate, pale underneath, covered with soft down; flowers dotted.

Hab. Fields and roads sides. N. S. June—Sept. 24.—Stem 2—3 feet high, and with the leaves downy and whitish. Flowers white, with a reddish tinge. Introduced. Cat-mint.

19. GLECHOMA. Linn.

'Calyx 5-cleft, subequal. Upper lip of the corol bifid; the lower one trifid, with the intermediate lobe emarginate. Anthers approaching each other in pairs and forming a cross.

Didynamia. Gymnospermia.

G. hederacea Linn.: leaves reniform, crenate, hairy, veined.

HAE. Road sides. N.S. W. to Ohio. May, June. 21.—Stems a foot high, decumbent. Flowers large, blue, in threes, axillary.

Ground Eye.

. 20. MARRUBIUM. Linn.

Calyx with 10 ribs and 5 or 10 spreading teeth. Upper lip of the corol bifid, linear, straight; lower one trifid; middle segment the largest, emarginate.

Didynamia. Gymnospermia.

M. rulgare Linn.: stem erect, woolly; leaves roundish-ovate, toothed, rugose, very woolly beneath; whorls villous, many-flowered; calyx with 10 setaceous uncinate teeth.

Hab. Road sides. Can. to Car. W. to Miss. July, Aug. 24.

—Stem 12—18 inches high. Flowers small, white, in crowded whorls. Smell aromatic; flavour bitter. Medicinal.

White Horehound.

21. BALLOTA. Linn.

Calyx with 10 ribs and 5 teeth. Upper lip of the corol concave, notched; lower one trifid; middle lobe the largest, emarginate,

Didynamia. Gymnospermia.

B. nigra Linn.: leaves ovate, undivided, serrate; calyx dilated above, subtruncate, with spreading teeth.

HAR. Mass. Big. July. 4.—Stem 2—3 feet high. Leaves a little cordate. Flowers purple or white, in axillary whorls.

Black Horehound.

22. MELISSA. Linn.

Calyx arid, above nearly flat; upper lip subfastigiate. Upper lip of the corol partly vaulted, bifid; middle lobe of the lower lip cordate.

Didynamia. Gymnospermia.

M. officinalis Linn.: whorls dimidiate; bracts oblong, pedicellate; leaves ovate-acute, serrate.

HAB. Road sides, &c. N. S. July. 21.—Naturalized. Balm.

23. HEDEOMA. Pers.

Calyx bilabiate, gibbous at the base; upper lip 3-toothed, lower 2; dentures all subulate. Corol ringent. Stamens 2-sterile; the 2 fertile ones about the length of the corol.

Diandria. Monogynia.

H. pulegioides Pers.: leaves oblong, serrate; peduncles axillary, many-flowered.—Cunila pulegioides Linn.—Ziziphora pulegioides R. & S.

HAB. Dry hills and woods. Can to Car. July, Aug. Q .- Stem 6-10 inches high, 4-sided, branched above. Flowers small, pale purple. Pennyroyal.

24. CLINOPODIUM. Linn.

Involucre of many linear acuminate leafets placed under the whorls of flowers. Upper lip of the corol erect, emarginate; lower one the largest, emarginate.

Didynamia. Gymnospermia.

C. vulgare Linn.: leaves petiolate, ovate, subserrate, hairy; whorls hairy, axillary and terminal; pedicels branched; bracts setaceous.

HAB. Rocky woods. Can. and N. S. W. to Miss. July, Aug. 21.—Stem 12-18 inches high. Flowers purple or rose coloured, in crowded whorls; smell aromatic. Wild Basil.

25. PRUNELLA. Linn.

Upper lip of the calyx with 3 very short teeth. Filaments forked at the extremity, one point bearing the anther. Stigma bifid. Didynamia. Gymnospermia.

P. vulgaris Linn.: leaves petiolate, oblong-ovate, toothed at base; lips of the calyx unequal; the upper one truncate, 3-awned; stem ascending.

HAB. Meadows. Can. to Car. W. to Miss. June-Aug. 24. -Stem 8-12 inches high, hairy. Flowers large, purple, densely whorled, so as to form an imbricated oblong spike.—P. pennsylvanica of Willdenow is a mere variety. Introduced.

Self-heal.

26. SCUTELLARIA. Linn.

Calyx bilabiate; upper lip with a lid covering the seeds like an operculum. Corol bilabiate; upper lip concave; low-Didynamia. Gymnospermia. er 3-lobed.

* Flowers axillary, solitary.

1. S. galericulata Linn.: somewhat branched; leaves cordate-lanceolate, subsessile, crenate; flowers axillary, solitary or in pairs; calyx hairy.

Near marshes. Can. and N. S. Aug. 21,-Stem 12-18 HAB. inches high. Flowers large, blue, pubescent.

Common Skull-cap.

2. S. gracilis Nutt.: stem mostly simple; leaves remote, broadovate, toothed, smooth and sessile, scabrous on the margin; upper ones smaller, entire; flowers axillary.

HAB. Shady rocks. Penn. S. to Louisiana. June. 24.—Stem 12—18 inches high, slender, erect. Leaves opposite, remote, sparingly toothed, veined. Flowers pale blue, axillary and op-

posite.—I have specimens collected near New-Orleans by Dr. T. R. Ingalls.

3. S. ambigua Nutt.: low, subdecumbent and divaricately branched; leaves sessile, ovate, remotely and rarely serrate, subhirsute above;

flowers small, axillary .- S. parvula Mich.?

Hab. Rocky grounds. Can. N. J. Ohio. W. to Miss. July. 21.—Root long, consisting of a succession of tubers. Stem coloured, branched divaricately from near the base, 4—6 inches high. Leaves small, closely sessile, prominently veined. Flowers small, axillary, blue, hairy.—I have found this plant on the slate hills near New-Brunswick, N. J. The specimens obtained from that locality, agree exactly with the Canadian plant received from my friend, Dr. A. F. Holmes, of Montreal. It has also been found by Dr. Houghton on the Upper Mississippi.

** Flowers racemose.

4. S. lateriflora Linn.: much branched, nearly smooth; leaves on long petioles, ovate, toothed, those of the stem slightly cordate, membranaceous; racemes lateral, leafy.

HAB. Wet meadows. Can. to Car. and W. to Miss. July, Aug. 21.—Stem 1—2 feet high, branching. Flowers small, blue, in long racemes.—At one time in great repute as a cure for hydrophobia.

Skull-cap.

- 5. S. integrifolia Linn.: stem nearly simple, densely pubescent; leaves subsessile, oblong, obtuse, wedge-form at base, obscurely toothed; racemes loose, leafy.
 - HAE. Swamps. N. Y. to Car. W. to Miss. June. 24.—Stem 18-24 inches high. Flowers large, blue, opposite, often in panicles.—A variable species.
- 6. S. hyssopifolia Linn.: minutely and densely pubescent, branched; leaves lanceolate-linear, very entire.
 - HAB. Swamps. Penn. Mahl. June. 24.—Stem a foot high.

 Leaves obtuse. Flowers very large.—Perhaps only a variety of the preceding.
- 7. S. pilosa Mich.: nearly simple; pubescent; leaves remote, rhombic-ovate, obtuse, attenuated at the base into a petiole, rounded-crenate; racemes terminal, loose, mostly branched; bracts lanceolate entire.—S. caroliniana Walt.—S. ovalifolia Mull. Torr.
 - HAB. Rocky woods. Penn. to Car. July. 21.—Stem 18—20 inches high. Lower leaves cordate. Flowers large, whitish, in paniculate racemes.
- 8. S. canescens Nutt.: branched; leaves ovate, acute, petiolate, acutely toothed, under side with the bracts and flowers hoary-villous; lower leaves subcordate; racemes pedicelled, subpaniculate, axillary and terminal; bracts ovate-lanceolate, longer than the calyx.

Hab. Woods. Penn. W. to Miss. July. 21.—Stem 2-3 feet high. Leaves large, whitish beneath. Flowers deep blue, in

lateral and terminal racemes.

27. SALVIA. Linn.

Calyx subcampanulate, 2-lipped; upper lip 3-toothed; lower bifid. Corol ringent. Filaments 2, fertile, bifid, one lobe ascending with a dimidiate anther, the other sterile.

Diandria. Monogynia.

1. S. lyrata Linn.: stem nearly leafless, retrosely pubescent; radicle leaves lyrate-dentate; upper lip of the corol very short.

HAB. Woods. Can. to Car. June. 21.—Stem about a foot high, densely covered with reflected hairs. Leaves mostly radical, more or less lyrate or pinnatifid, very obtuse. Flowers blue, about 6 in a whorl.

2. S. claytoni Ell.: leaves cordate-ovate, sinuate, toothed, rugose; teeth of the upper lip of the calyx connivent.—Salvia verbenacea Muhl.

IIAB. Woods. Penn. to Car. June—Oct. 21.—Stem erect, 8—12 inches high. Flowers in whorls, violet.

3. S. urticifolia Linn.: viscous and villous; leaves ovate-oblong, toothed, base narrowed into a petiole; calyx 3-cleft, the upper segment 3-toothed.

IIAB. Mountains. N. J. to Car. June. 21.—Leaves ovate, very pubescent. Flowers blue, viscous, in remote whorls.

ORDER XCI. VERBENACEÆ. Brown. Lind.

Calyx tubular, persistent, inferior. Corol hypogynous, monopetalous, tubular, deciduous, limb usually irregular. Stamens usually 4, didynamous, seldom equal, sometimes only 2. Ovary 2—4-celled; ovules erect or pendulous, solitary or twin; style 1; stigma bifid or undivided. Fruit a drupe or berry. Seeds erect or pendulous; albumen none or very thin; embryo crect.

Trees, shrubs or herbs. Leaves generally opposite, simple or compound, without stipules.

1. VERBENA. Linu.

Calyx 5-cleft. Corol funnel-form; limb unequal, 5-cleft. Stamens 4, dydynamous. Pericarp thin, evanescent. Seeds 4.—Flowers paniculate-spiked. Didynamia. Angiospermia.

* Leaves laciniate.

1. V. hastata Linn.: erect, tall; leaves lanceolate, acuminate, sharply serrate; lower ones lobed or subhastate; spikes filiform, erect, panicled, somewhat imbricate; flowers tetrandrous.

HAB. Low grounds. Can. to Geor. W. to Miss. July, Aug.

21.—Stem 3—5 feet high. Leaves rough. Flowers small, purple, forming numerous spikes.

2. V. spuria Linn.: stem decumbent, branched, divaricate; leaves laciniate, much divided; spikes filiform, loose; bracts longer than the calyx.

HAB. Sandy fields. Penn. to Car. W. to Miss. Aug.—Oct.

—Stem 1—2 feet long. Flowers small, blue, in paniculate

spikes, at length scattered.

· ** Leaves entire.

3. V. urticifolia Linn.: erect, somewhat pubescent; leaves ovate, acute, serrate, petiolate; spikes filiform, axillary and terminal; flowers distinct, tetrandrous.

HAB. Road sides. N. Y. to Car. July, Aug. 21.—Stem 2—3 feet high, somewhat hairy. Flowers small, white, tinged with purple, in filiform spikes forming panicles.

purple, in inform spikes forming panieres.

4. V. angustifolia Mich.: erect, mostly simple; leaves linear-lanceolate, attenuate at the base, remotely toothed, with elevated veins; spikes filiform, solitary, axillary and terminal.—V. rugosa Willd.

HAB. Rocky grounds. N. Y. and Penn. W. to Miss. June-

Aug. 24 .- Stem a foot high, hairy. Flowers blue.

2. ZAPANIA. Link.

Calyx 5-toothed. Corol 5-lobed. Stamens 4, didynamous. Stigma peltately capitate, oblique. Seeds 2, at first covered by an evanescent pericarp.—Flowers in heads.

Didynamia. Angiospermia.

1. Z. nodiflora Lam.: leaves ovate-wedge-form, serrate above; spikes solitary, on long filiform peduncles, forming conical heads; stem herbaceous, creeping.—Verbena nodiflora Linn.—Lippia nodiflora Mich.

Hab. Low grounds. Penn. to Car. W. to Miss. July. 21.—
Stem 6—8 inches long, procumbent. Flowers bluish-white, in heads which are on peduncles 4—6 inches long.

2. Z. lanceolata Pers.: leaves linear-lanceolate, acutely serrate; spikes solitary, on long peduncles, forming conical heads; stem herbaceous, creeping.—Lippia lanceolata Mich.

Hab. Banks of streams. Penn. to Car. July, Aug. 21.—Does not differ from the former, except in the shape of the leaves; and is, perhaps, not a distinct species.

3. PHRYMA. Linn.

Calyx cylindric; upper lip longer, trifid; lower 2-toothed.

Corol with the upper lip emarginate, the lower much longer.

Seed one.

Didynamia. Angiospermia.

P. leptostachya Linn.: leaves ovate, toothed, petioled; spikes terminal, slender; flowers opposite.

HAB. Shady woods. Can. to Car. July. 21.—Stem 2-3 feet high. Leaves large. Spikes on long slender peduncles. Flowers small, opposite, purplish. Calyx reflected downwards when in fruit. Lopseed.

ORDER XCH. ACANTHACEÆ. Juss. Lind.

Calyx 4 or 5-divided, rarely either multifid or entire and obsolete, persistent. Corol mostly irregular, with the limb ringent or bilabiate, or occasionally 1-lipped, sometimes nearly equal, deciduous. Stamens mostly 2, sometimes with 2—3 shorter ones; anthers 1—2-celled, bursting longitudinally. Ovary seated in the disk, 2-celled; ovules 2 or many in each cell; style 1; stigma 2-lobed or entire; placentæ in the axis. Capsule 2-celled, bursting elastically with 2 valves. Seeds 2 or many in each cell, or by abortion solitary, ascending, usually subtended by rigid subulate processes from the dissepiment; albumen none; embryo curved or straight; radicle cylindrical, descending, next the hilum; cotyledons large, foliaceous.

Herbs or shrubs. Leaves opposite, without stipules.

1. JUSTICIA. Linn:

Calyx 5-parted, often with 2 bracts at the base. Corol irregular, bilabiate; upper lip emarginate; the lower 3-cleft. Filaments 2, each with a single or double anther. Stigma 1. Capsule attenuated, 2-celled, 2-valved; dissepiment growing from the centre of each valve.

Diandria. Monogynia.

J. pedunculosa Mich.: spikes axillary; peduncles elongated, alternate; flowers crowded; leaves lanceolate.—J. americana Vahl.—J. hnearifolia Lam.—Dianthera americana Linn.

Hab. In water. Can. to Car. W. to Miss. July, Aug. 21.—
Root creeping. Stem 2 feet high. Leaves nearly 6 inches long,
narrow-lanceolate. Flowers on axillary peduncles which are
nearly as long as the leaves, pale purple.

2. RUELLIA. Linn.

Calyx 5-parted, often bibracteate. Corol subcampanulate. border 5-lobed. Stamens approximating by pairs. Capsule attenuated at either extremity, bursting with elastic teeth. Seeds few. Didynamia. Angiospermia.

R. strepens Linn.: erect, hairy; leaves on petioles, opposite, lanceolate-ovate, entire; peduncles 1—3-flowered; segments of the calyx linear-lanceolate, very acute, hispid, shorter than the tube of the corol. HAB. Shady woods. Penn. to Geor. W. to Miss. July. 21.
—Stem 8—12 inches high. Flowers axillary, blue.

ORDER XCIII. LENTIBULARIÆ. Rich. Lind.

Calyx divided, persistent. Corol irregular, bilabiate, with a spur. Stamens 2, included within the corol and inserted into its base; anthers 1-celled, sometimes contracted in the middle. Ovary 1-celled; style 1; stigma bilamellate. Capsule 1-celled, many-seeded, with a large central placenta. Seeds minute; albumen none; embryo sometimes undivided.

Herbs, growing in water or marshes. Leaves radical, undivided; or compound, resembling roots and bearing little vescicles.

1. PINGUICULA. Linn.

Calyx 4—5-cleft. Corol ringent, spurred at the base beneath. Stamens 2, very short. Stigma 2-lipped.

Diandria. Monogynia.

P. vulgaris Linn.: spur cylindrical, acute, as long as the veinless petal; upper lip 2-lobed; lower one in three unequal obtuse segments.

—P. elatior Mich.?

Hab. Wet rocks. Rochester, N. Y. N. to Arc. Amer. April. 21.—Leaves all radical, spatulate-ovate, fleshy. Scape 4—6 inches high. Flowers solitary, nodding; tube of the corol, villose, purple.—Specimens of this plant, from the vicinity of Rochester, N. Y., appear to me to differ in no respect from the foreign one.

2. UTRICULARIA. Linn.

Calyx 2-parted; lips undivided, nearly equal. Corol personate, with the lower lip spurred at the base. Stamens 2, with the filaments incurved bearing the anthers within the apex. Stigma 2-lipped. Capsule 1-celled.

Diandria. Monogynia.

Obs. The North American species of this genus have been attentively studied by Capt. Le Conte, whose valuable observations are published in the first volume of the Annals of the New-York Lyceum.

1. U. ceratophylla Mich.: floating; scape many-flowered; radicle leaves whorled, inflated, pinnatifid at the extremities; lower lip of the corol deeply 3-lobed; spur short, obtuse, deeply emarginate.—U. inflata Walt.

Hab. Ponds. N. Y. to Mexico. July, Aug. 21.—Root very long, branching, with capillary radicles furnished with numer-

- ous compressed air vessels. Stem 8 inches high. Flowers large, yellow, subcorymbed. Flowers large, Bladderwort.
- 2. U. rulgaris Linn.: floating; stems submerged, dichotomous; leaves many-parted, margins bristly; scape 5—9-flowered; upper lip of the corol entire, broad-ovate; spur conical, incurved.—U. macrorhiza Le Conte.
 - IIAB. Pools and ponds of deep water. Can. to Car. Aug. 24.
 —Root much branched. Scape 8—10 inches high. Flowers large, racemed, yellow; spur entire at the apex and rather obtuse.
- 3. U. fornicata Le Conte: floating; scape 1—2-flowered; upper lip 3-lobed, the middle lobe arched over the palate; spur incurved, conoidal, obtuse, very entire, appressed to the lower lip of the corol—U. minor Pursh. Torr.—U. gilba Ell.
 - Hab. Swamps and ditches. N. Y. to Geor. Aug. 21.—Root furnished with air vessels. Scape naked. Flowers few, small, yellow.—According to Capt. Le Conte, it bears no resemblance to U. minor of Europe, except in the smallness of its flowers.
- 4. U. sctacea Mich.: scape filiform, rooting, with 2 or more flowers; upper lip of the corol ovate; the lower decply 3-lobed; spur subulate, as long as the lower lip of the corol.—U. subulata Pursh.—U. pumila Wult.
 - HAB. Swamps. N. Y. to Flor. June. 24.—Scape very slender, 4—6 inches high, furnished with scales. Flowers many, small, yellow. Upper lip of the corol half the size of the lower.
- 5. U. gibba Gron.: floating; scape mostly 2-flowered; spur shorter than the lower lip of the corol, obtuse, gibbous in the middle.
 - HAB. Ponds. N. S. July. 21.—Scape 2—3 inches high, (4-7-flowered. Le Conte.) Flowers small, yellow. Spur swelling out in the middle.
- 6. U. cornuta Mich.: scape rooting, crect, rigid; flowers 2-3, subsessilc; lower lip of the corol very wide, 3-lobed; spur very acute, porrected.
 - HAR. Wet rocks. Can. and N. S. On Lake Superior. Dr. Houghton. Aug. 21.—Scape 10 inches high, with minute bracts. Plowers yellow, approximate, nearly sessile, as large as those of U. rulgaris.
- 7. U. striuta Le Conte: floating; scape 2—6 flowered; upper lip of the corol ovate-round, subemarginate, margin waved; lower lip 3-lobed, reflected at the sides; spur straight, obtuse, shorter than the lower lip. —U. fibrosa Ell. not of Walt.
 - HAR. Swamps. N. Y. to Flor. June. 21—Root furnished with air vessels. Scape a foot high. Corol large, yellow, striated with rcd; spur much shorter than the lower lip.
- 8. U. personata Le Conte: scape rooting, many-flowered; upper lip of the corol emarginate, reclinate; lower small, entire; palate very large; spur linear subulate, somewhat acute.

HAB. Bogs. N. Eng. to Flor. Le Conte. . —Scape 12—18 inches high, 4—10-flowered, furnished with scales. Flowers yellow, rather large. Spur more slender and acute than in U. cornuta.—Resembles an Antirrhinum.

9. U. purpurea Walt.: scapes axillary, generally 1-flowered; involucre none; lower lip of the corol 3-lobed; lateral lobes cucullate on the under side; spur compressed, half as long as the corol.—U. saccata Ell.

HAB. Ponds on mountains. Mass to Flor. N. W. Territory. Houghton. Scapes solitary and in pairs, 2-3 inches long. Flowers purple.

ORDER XCIV. PRIMULACEÆ. Juss. Lind.

Calyx 5- rarely 4-cleft, inferior, regular, persistent. Corol monopetalous, hypogynous, regular; the limb 5- rarely 4-cleft. Stamens inserted upon the corol, equal in number, and opposite to its segments. Ovary 1-celled; style 1; stigmas capitate. Capsule opening with valves; placentæ central, distinct. Seeds numerous, peltate; embryo straight, cylindrical, included within fleshy albumen, and lying across the hilum.

Herbs, with the leaves usually opposite and either whorled or scattered.

1. PRIMULA. Linn.

Calyx tubular, 5-toothed. Corol salver-form; tube cylindrical; orifice naked. Stamens 5, not exserted. Stigma globose. Capsule opening with 10 teeth.—Flowers in an involucrate umbel. Pentandria. Monogynia.

P. farinosa var. americana Torr.: leaves obovate-spatulate, repandly crenate-dentate, pulverulent beneath; umbel many-flowered; peduncles spreading; border of the corol flat, as long as the tube, with obtuse obcordate segments.—P. pusilla Goldic.

HAB. Shores of Lake Huron and Superior. 24.—Scape 6—10 inches high. Leaves all radical. Flowers pale purple.

Bird's-eye Primrose.

2. DODECANTHEON. Linn.

Calyx 5-cleft. Corol rotate, reflexed, 5-cleft. Stamens 5, seated in the tube. Stigma obtuse. Capsule 1-celled, oblong, opening at the apex. Pentandria. Monogynia.

1. D. meadia Linn.: scape erect, simple, smooth; leaves oblong-oval, repandly toothed; umbel many-flowered; flowers nodding; bracts numerous, oval.

IIAB. Rocky places. Penn. to Virg. W. to Miss. May, June. 21.—Scape 8—12 inches high. Flowers large, purple.

2. D. integrifolium Mich.: leaves oblong-oval, subspatulate; umbel few-flowered, straight; bracts linear.

IIAB. Mountains. Penn.? N. to Subarc. Amer. June. 21.— Flowers pale blue, smaller than in the preceding. Pursh.

3. TRIENTALIS. Linn.

Calyx 7-parted. Corol rotate, in 7 segments, regular and flat. Stamens 5—S. Berry dry, opening at the suture. Seeds many. Heptandria. Monogynia.

T. americana Pursh: leaves narrow-lanceolate, serrulate, acuminate; pctals acuminate.—T. europæa Mich.—T. europæa var. angustifolia Nutt. Torr.

HAB. Low woods. N. S. N. to Subarc. Amer. May, June. 24.—Stem 6 inches high. Leaves 6 or 7 in a terminal whorl. Flowers white, on terminal filiform peduncles.

4. HOTTONIA. Linn.

Calyx 5-parted. Corol salver-form, 5-lobed. Stamens seated on the tube of the corol. Stigma globular. Capsule 1-celled, globose, acuminate. Pentandria. Monogynia.

H. inflata Linn.: stem thick, generally submersed; scape jointed, with the internodes and lower part inflated; flowers verticillate, mostly in fours, pedunculate.—H. palustris Pursh.

Hab. Stagnant waters. N. Y. to Geor.; rare. July. 21.—
Stem thick, spongy, generally submersed. Leaves long and pectinate. Flowers whorled, on peduncles, white.—Abundant near North Salem, Westchester co., N. Y. Dr. S. B. Mead.

Water Feather.

5. GLAUX. Linn.

Calyx campanulate, 5-lobed, coloured. Corol none. Stamens 5. Capsule globose, 5-valved, 5-seeded, surrounded by the calyx. Receptacle rounded, marked with favulose punctures. Pentandria. Monogynia.

G maritima Linn.

HAB. Marshes on the sea coast. Can. and N. S.; rare. July. 21.—Stem suberect or procumbent, 4—5 inches high, very leafy. Leaves opposite, ovate or roundish, smooth, entire, fleshy. Flowers minute, sessile, solitary, axillary, reddish-white.—For specimens of this plant from the vicinity of Boston, I am indebted to my friend Dr. Charles Pickering of Philadelphia.

Black Salt-wort.

6. LYSIMACHIA. Linn.

Calyx 5-parted. Corol 5-cleft, rotate. Stamens 5. Stigma 1. Capsule globose, 10-valved.

Pentandria. Monogynia.

- 1. L. stricta Ait.: stem erect, smooth; leaves opposite, lanceolate, sessile, punctate; raceme terminal, very long, lax; pedicels long, slender.—L. racemosa Mich. Pursh.
 - Hab. Low grounds. Can. to Vir. July, Aug. 24.—Stem 12—18 inches high. Leaves few, with bulbs in the axils. Flowers yellow, on capillary pedicels, arranged in a terminal raceme 6—8 inches long. Upright Loosestrife.
- 2. L. quadrifolia Linn.: stem simple, a little hairy; leaves in whorls of four or fives, ovate-lanceolate, nearly sessile, acuminate; peduncles in fours, axillary, 1-flowered; segments of the corol oval, entire.—L. hirsuta Mich.—L. punctata Walt.
 - Hab. Low grounds. Can. to Car. June, July. 21.—Stem 12—18 inches high. Leaves varying from 3—8 in a whorl, though generally four. Flowers yellow.
- 3. L. longifolia Pursh: very smooth and branched; leaves opposite, sessile, linear, very long; upper ones in fours; peduncles in fours, 1-flowered; segments of the corol ovate, acuminate, serrulate.—L. quadrifolia Sims.
 - Hab. Wet woods. Penn. to Vir. Parsh. June. 21.—Stem 2—3 feet high. Leaves narrow, not dotted; floral ones whorled. Flowers mostly at the extremity of the branches, at length nodding.—It seems to be distinct from the preceding, although not so considered by Muhlenberg.
- 4. L. ciliata Linn.: stem nearly smooth; leaves opposite, on long petioles, subcordate-ovate, acuminate; petioles ciliate; peduncles mostly in pairs, 1-flowered; flowers drooping; segments of the corol rounded, acuminate, crenate.

HAB. Banks of streams. Can. to Car. July. 21.—Stem 2—3 feet high. Flowers large, yellow, the corol deeply 5-cleft.

- 5. L. hybrida Mich.: stem smooth; leaves petioled, opposite, lanceolate, acute at each end; petioles ciliate; flowers nodding; peduncles axillary; corol shorter than the calyx; divisions erenulate.—L. heterophylla Nutt.
 - Hab. Moist grounds. N. Y. to Car. July. 21.—Resembles the preceding species in every respect except in the form of the leaves which are narrow and lanceolate, and never cordate at base.
- 6. L. capitatu Pursh: stem smooth, simple, punctate; leaves opposite, sessile, broad-lanceolate, punctate; peduncles axillary, elongated; flowers in dense roundish heads, 6—7-parted.—L. thyrsifolia Mich.?
 - HAB. Swamps. N. S. N. to Arc. Amer. June. 21.—Stem a foot high. Flowers yellow, in roundish or ovate heads which are on axillary peduncles.

7. L. revoluta Nutt.: stem square, smooth, branched; leaves opposite, sessile, long linear, margin revolute; peduncles 1-flowered, sub-

terminal, nodding.

HAB. Rocks. N. Y. to Del. Aug. 21.—Stem 12—18 inches high. Flowers yellow, mostly on the summit of the stem, on stender peduncles.—This species is abundant on the shores of the great lakes, and Dr. Houghton informs me that he has found it on the banks of the St. Croix river, in the North Western Territory.

7. ANAGALLIS. Linn.

Calyx 5-parted. Corol rotate, 5-lobed. Stamens 5; filaments hairy. Capsule globular, opening hemispherically, many-seeded.

Pentandria. Monogynia.

A. arrensis Linn.: stem procumbent, branched; leaves opposite, ovate, sessile, dotted beneath, very entire; margin of the corol broadly and very obtusely crenate, pilose-glandular.

HAB. Fields, &c. N. Y. to Car. July. Q .- Stem 4-6 inches

high. Flowers scarlet, in solitary axillary peduncles.

Scarlet Pimpernel.

8. SAMOLUS. Linn.

Calyx 5-cleft, semisuperior, persistent. Corol salver-form, 5-lobed. Stamens 5, antheriferous, opposite the segments of the corol, and 5 (scales) alternate with them, sterile. Capsule half inferior, 1-celled, 5-toothed, many-seeded; receptacle unconnected.

Pentandria. Monogynia.

S. valerandi Linn.: stem erect; leaves obtuse; racemes many-flowered; pedicels with small bracts.

HAB. Wet grounds. Can. to Car. July—Sept. 2f.—Stem 8—12 inches high, smooth. Leaves ovate, subpetiolate, entire and somewhat fleshy. Flowers small, white. Water Pimpernel.

ORDER XCV. PLUMBAGINEÆ. Juss. Lind.

Calyx tubular, plaited, persistent. Corol monopetalous or of 5 petals, regular. Stamens 5, hypogynous when the petals are combined, inserted into the base of the petals when distinct. Ovary free, 1-celled; ovule pendulous, from the end of an umbilical cord, arising from the bottom of the cell; styles 5, seldom 3-4, each bearing a subulate stigma. Fruit a utricle. Seed pendulous; embryo straight; radicle superior.

Herbs or undershrubs. Leaves alternate or clustered, un-

divided, somewhat sheathing at base.

1. STATICE. Linn.

Calyx funnel-form, plaited, scarious. Petals 5. Stamens 5, inserted on the petals. Styles 5. Pericarp indehiscent.—Flowers in spikes or heads.

Pentandria. Pentagynia.

- 1. S. limonium Linn.: scape paniculate, terete; leaves all radical, oblong, undulate, smooth and nerveless, mucronate below the tip.—S. caroliniana Walt.
 - Hab. Salt marshes. N. Y. to Car. Aug.—Oct. 21.—Root large, lignous. Scape longer than the leaves, with several lanceolate bracts. Flowers sessile, secund, in a very large and much branched panicle, blue.—A valuable astringent. Big. Med. Bot. ii. 51.

 Marsh Rosemary.
- 2. S. armeria Linn.: leaves all radical, linear, flat, smooth; scape simple, terete, bearing a round head of flowers.
 - Hab. Rocks near the sea shore. Penn. to Vir. Pursh. N. to Arc. Amer. July, Aug. 24.—Root large, ligneous. Scape a foot high. Heads of flowers rose coloured, intermixed with scales and having also a 3-leaved general involucre.

 Thrift.

ORDER XCVI. PLANTAGINEÆ. Juss. Lind.

Flowers usually monoclinous, seldom diclinous. Calyx 4-parted, persistent. Corol monopetalous, persistent, with a 4-parted limb. Stamens 4, inserted into the corol, alternate with its segments; filaments long, filiform, doubled inwards in æstivation; anthers versatile, 2-celled. Ovary sessile, without a disk, 2-very seldom 4-celled; ovules solitary, in pairs or indefinite; style simple, capillary; stigma hispid, simple or rarely bifid. Capsule membranous, opening transversely. Seeds sessile, peltate or erect; embryo in the axis of fleshy albumen; radicle inferior.

Herbs usually stemless. Leaves flat and ribbed, or taper and fleshy.

1. PLANTAGO. Lina.

Flowers perfect. Calyx 4-cleft. Corol 4-cleft; border reflected. Stamens 4, mostly exserted, very long. Capsulc 2—4-celled, opening transversely.

Tetrandria. Monogynia.

* Leaves broad.

1. P. cordata Lam.: leaves on long petioles, ovate, cordate, very broad, subdentate, smooth; spike very long; flowers subimbricated;

the lower ones scattered; bracts ovate, obtuse; cells of the capsule 2-seeded.—P. kentuckiensis Mich.

- HAE. Banks of streams. Can. N. Y. and Penn. W. to Tenn. June—July. 21.—Scape 12—18 inches high. Leaves 6 inches long, smooth, generally cordate at base. Flowers in a slender elongated spike.—Sprengel considers the P. asiatica of Europe, and P. glabra of Nuttall, synonymous with it.
- 2. P. major Linn.: leaves ovate, smoothish, subdentate, on longish petioles; scape terete; spike cylindrical, very long; flowers closely imbricated; cells of the capsule many seeded.
 - HAB. Fields, &c. Throughout Can. and the U.S. June—Aug. 21.—Leaves spreading on the ground, coarsely toothed. Scape 8—12 inches high, pubescent. Spike 2—6 inches long, close. Introduced. Common Plantain.
- 3. P. media Linn.: leaves evate, pubescent, on very short petioles; spike short, cylindrical; scape rounded; cells of the capsule 1-seeded.
 - HAB. Fields. N. Y. and Penn. July. 21.—Leaves 2 inches long. Scape longer than the leaves. Flowers in a closely imbricated spike, which is seldom more than 2 inches long.
- 4. P. virginica Linn.: hairy-pubescent; leaves lanceolate-ovate, sparingly toothed, 3-nerved, tapering at base; spike cylindrical, with remote flowers; scape angular.
 - HAB. Sandy soils. Throughout the U.S. June. 3.—Scape hairy, almost hispid, longer than the leaves. Spikes 1—4 inches long, with the flowers at first crowded, but at length distant. Corol yellowish.
- 5. P. lanceolata Linn.: leaves lanceolate, tapering at each end, 3-5-nerved, remotely toothed; spike short, ovate-cylindrical, compact; scape angled; capsule 2-seeded.
 - Hab. Pastures. Can. to Çar. May—Sept. 21.—Scape 6—12 inches high, a little hairy. Flowers in a very dense spike. Bracts ovate, brownish, as long as the calyx. Introduced.
- 6. P. cucullata Lam.; leaves ovate-cucullate, subdenticulate, 9-nerved, pubescent beneath; spike cylindrical, imbricated; scape terete.—
 P. maxima Jacq. Torr.

HAB. Moist rocky situations. Can. and Maine. Pursh. July, Aug. 24.

** Leaves linear.

7. P. maritima Linn.: leaves linear, grooved, fleshy, hairy near the base, mostly entire, often remotely toothed; scape round, terete; spike cylindrical, dense.—P. pauciflora Pursh.

HAB. Salt marshes. N. S. Aug., Sept. 24.—Scape 6—10 inches high. Leaves fleshy. Spike cylindrical, short.

8. P. pusilla Nutt.: minutely pubescent; leaves linear-subulate, flat, entire, acute; scape terete, slender, longer than the leaves; spike cylindrical, loose; lower flowers distant; bracts ovate, acute, as long as the calyx.—P. hibrida Bart.?—P. linearifolia Muhl.?

25

HAB. Sandy hills. Penn. to Flor. W. to Miss. June. @.— Scape 2-3 inches high. Flowers in an interrupted spike.

SUBCLASS IV. MONOCHLAMYDEÆ.

Flowers with a simple perianth or perigonium. (Apetalous.)

ORDER XCVII. AMARANTHACEÆ. Juss. Lind.

Perianth 3—5-parted, hypogynous, scarious, persistent. Stamens hypogynous, either 5, or some multiple of that number, distinct or monadelphous; anthers I—2-celled. Ovary single, superior, 1 or few-seeded; style 1 or none; stigma simple or compound. Fruit a membranaceous utricle. Seeds lentiform, pendulous; testa crustaceous; albumen central, farinaceous; embryo curved round the circumference; radicle next the hilum; plunula inconspicuous.

Herbs or shrubs. Leaves simple opposite or alternate. Flowers in heads or spikes, occasionally diclinous, generally monoclinous.

1. AMARANTHUS. Linn.

Monoecious. Perianth 2-5-leaved. Sterile Fl. Stamens 3-5. Fertile Fl. Styles 3. Capsule 1-celled, opening transversely all round. Seed 1.

Monoecia. Pentandria.

1. A. lividus Linn.: stem erect; leaves elliptic, retuse; flowers clustered, triandrous, in rounded spikes.

Hab. Cultivated grounds. N. S. Torr. June—Aug. Q.—Stem 2—3 feet high, smooth.

2. A. hybridus Linn.: leaves ovate-lanceolate; flowers pentandrous; perianth subulate; racemes decompound, erect, crowded.

Hab. Near gardens, &c. N. Y. to Car. June—Sept. .—
Stem 2—3 feet high. Introduced.?

3. A. blitum Linn.: stem diffuse; leaves ovate, retuse; flowers triandrous, three-leaved; racemes somewhat spiked.

Hab. In and about gardens. N. S. June-Sept. Q.-Introduced.

4. A. spinosus Linn.: axils spiny; racemes terminal, compound; flowers pentandrous.

HAB. *Road sides. June—Sept. Q.—Stem diffuse, generally coloured. Introduced.

5. A. retroflexus Linn.: branches pubeseent; leaves ovate, undulate; racemes ereet, much compounded; flowers pentandrous.

HAB. Among rubbish, &c. Penn. to Virg. Aug. . Pursh.

6. A. pumilus Nutt.: stem diffuse, smooth; leaves ovate, obtuse, smooth and fleshy, often retuse; flowers pentandrous, in axillary clusters.

HAB. Sandy beach. N. Y. Aug. O .- Stem a foot high, somewhat decumbent. Flowers green.

ORDER XCVIII. CHENOPODEA. De Cand. Lind.

Perianth deeply divided, sometimes tubular at the base, persistent. Stamens inserted into the base of the calyx, opposite its segments and equal to them in number or fewer. Ovary single, superior, or occasionally adhering to the tube of the calyx. Style 2—4-divided, rarely simple; stigmas simple. Fruit membranous, not valvular, sometimes berried. Seed erect; embryo curved round farinaceous albumen, or spiral, or doubled together without albumen; radicle next the hilum; plumula inconspicuous.

Herbs or undershrubs. Leaves alternate, without stipules, occasionally opposite. Flowers small, sometimes polygamous.

1. CHENOPODIUM. Linn.

Flowers perfect. Perianth 5-cleft, closing upon but not wholly enveloping the fruit. Stamens 5. Styles 2.

Pentandria. Digynia.

- * Leaves ovate or rhomboid, often toothed or lobed.
- 1. C. bonus henrieus Linn.: leaves triangular, sagittate, very entire; spikes compound, peduncled, crowded, terminal and axillary, erect, leafless.
 - Hab. N. Y. Mahl. June. 21.—Stem a foot high, striate.

 Leaves large, dark green. Flowers green. Good King Henry.
- 2. C. rhombifolium Muhl.: leaves triangular-rhombie, acute, repandly toothed; upper ones lanceolate, toothed, cuneate at base; racemes axillary, ereet, leafless.

HAB. Penn. Muhl. June. O .- Flowers in short simple racemes.

3. C. rubrum Linn.: leaves rhomboid-triangular, deeply toothed and sinuate; racemes erect, compound, leafy.

HAB. Waste places. N. S. Aug. @.—Stem 2 feet high, reddish. Racemes very compound, intermixed with small leaves, Introduced.

- 4. C. hybridum Linn.: leaves cordate, angularly toothed, acuminate; racemes much branched in a somewhat cymose manner, divaricate, leafless.
 - Hab. Waste places. N. S. July, Aug. @.—Stem 2—3 feet high, slender, with large and bright green leaves. Flowers in compound clusters, remote from the leaves. Introduced.
- 5. C. album Linn,; leaves ovate, inclining to rhomboid, jagged, entire at the base; upper ones perfectly entire; racemes branched, somewhat leafy; seed very smooth.

b. viride Pursh: leaves greener and more entire; racemes more

branched, a little leafy. - C. viride Linn.

- Hab. Waste grounds. N. S. July, Aug. O.—Stem 2 feet high.

 Leaves covered with a mealy substance. Racenes somewhat branched, conglomerate.

 Lamb's-quarters.
- C. ambrosioides Linn.: leaves lanceolate, remotely toothed; racemes simple, axillary, leafy.
 - HAE. Road sides. N. S. Aug., Sept. . Stem 18 inches high, much branched, somewhat pubescent. Leaves on short petioles. Flowers green, in erect spikes. Sweet Pigweed.
- 7. C. botrys Linn.: leaves oblong, pinnatifid-sinuate; racemes naked, many-cleft, very large; flowers distinct, on short pedicels.
 - HAB. Waste places. N. S. July—Sept. . Stem short, branching, somewhat viscid. Flowers in numerous short axillary racemes covering the ends of the branches.—Whole plant has a strong smell.

 Jerusalem Oak.
- 8. C. anthelminticum Linn.: leaves oblong-lanceolate, nearly sessile, coarsely toothed; spikes long, interrupted, leafless, axillary and terminal; style 3-cleft.

HAB. Fields. N. S. Aug. 24.—Stem 1 1-2—2 feet high, much branched. Racemes long and slender, axillary and terminal.

Worm-seed.

9. C. glaucum Linn.: leaves oblong, repand, smooth, glaucous beneath; spikes simple, naked, glomerate, terminal and axillary.

HAB. In N. Y. Muhl. . Stem diffuse, thick. Racemes short, leafless.

** Leaves linear, fleshy.

10. C. maritimum Linn.: leaves linear, subulate, fleshy, semi-cylindrical; flowers in sessile axillary clusters; stainens shorter than the petals.—Salsola salsa Mich. Pursh.—S. linearis Ell.

lary glomerules.

2. ATRIPLEX. Linn.

Flowers polygamous. Perianth single, 5-parted. Sta-

mens 5. Style 2-parted. Fruit depressed, covered by the calyx. Female FL. Perianth 2-parted. Stamens none.

Pentandria. Digynia.

1. A. halimus Linn.: stem frutescent; leaves alternate or opposite, oblong-subrhomboid, entire, decurrent into the petiole.

HAB. New-Jersev. Muhl. b.

- 2. A. laciniata Pursh: stem herbaceous, diffuse, pubescent towards the summit; leaves triangular, deeply toothed, white pubescent beneath; lower ones opposite; perfect flowers tetandrous; perianth of the fruit rhomboid, acute, entire.—A. laciniata var. americana Torr.
 - HAB. Salt marshes. N. Y. to Car. June-Aug. O .- Stem mostly procumbent. Leaves covered with small grayish scales. Flowers in axillary clusters.
- 3. A. patula Linn.: stem herbaceous, spreading; leaves triangularhastate, acuminate, smooth above, irregularly toothed; the upper ones entire; perianth of the fruit submuricate on the sides.
 - HAB. N. Y. to Car. Aug. @.—Stem prostrate, 1-2 feet Leaves on petioles nearly an inch long. Flowers clustered on axillary and terminal spikes.
- 4. A. arenaria Nutt.: stcm herbaceous, spreading; leaves oblongovate, subsessile, silvery-mealy beneath, very entire; upper ones acute or acuminate; perianth of the fruit muricate, dentate, retuse.
 - Hab. Sea coast. N. J. to Car. Aug., Sept. @.—Stem a foot high, angular, much branched. Lower teaves often cuneate. Flowers monoecious; the sterile ones in short glomerate spikes at the end of the branches; the fertile ones in axillary clusters.
- 5. A. hortensis Linn.: stem crect, herbaceous; leaves triangular, dentate, green on both sides; perianth of the fruit ovate, reticulate, entire; flowers in terminal interrupted racemes or spikes.

HAB. Cultivated grounds. N. S.; rare. Torr. July. . Stem 3-4 feet high. Leaves 2-3 inches long. Flowers green.

Introduced.

3. ACNIDA. Linn.

Dioecious. Sterile Fl. Perianth 5-parted. Stamens 5. FERTILE FL. Perianth 3-parted. Styles none. Stigmas 3-5, sessile. Capsule 1-seeded. Dioccia. Pentandria.

- 1. A. cannabina Linn.: leaves ovate-lanceolate; capsules smooth, acutely angled:
 - HAB. Marshes. Can. to Flor. July, Aug. @ .- Stem 3-6 feet high, slightly angled. Leaves alternate, ribbed, 2-5 inches long, petioled. Flowers small, green, in large axillary and terminal panicles. Water Hemp.
- 2. A. ruscocarpa Mich.: leaves oval-lanceolate; capsules obtusely angled, rugose.

Hab. Marshes. Can. to Flor. Nutt. July. ©.—Plant 6-8 feet high. Stem angled.

4. SALICORNIA. Linn.

Perianth single, turbinate, fleshy, closed. Stamens 1—2. Style 1, bifid. Utricle included in the enlarged perianth.

Monandria. Monogynia.

- 1. S. herbacen Linn.: annual; stem erect or branched; joints compressed, notched at the summits; spikes peduncled, cylindrical, slightly tapering at the extremity; perianth truncated—and S. virginica Linn. Pursh.
 - Hab. See coast and salt marshes. N. Y. to Car. Sept. ©.—

 Plant destitute of leaves. Stem 6-10 inches high, branched.

 Flowers very minute, in threes at each joint.

Herbaceous Samphire.

- 2. S. ambigua Mich.: perennial, procumbent, branching; joints crescent-shaped, small; spikes opposite and alternate; ealyx truncate.
 - Hab. Salt meadows. N. J. to Car. July, Aug. 3 or 21.—Stem procumbent and ascending. Anthers purplish-yellow.—Resembles S. fruticosa of Linnæus. Shrubby Samphire.

5. SALSOLA. Linn.

Flowers perfect. Perianth 5-cleft, persistent, enveloping the fruit with its base, and crowning it with its enlarged limb. Stameus 5. Styles 2. Embryo spiral.

Pentandria. Digynia.

1. S. soda Linn.: herbaceous, smooth; branches ascending; leaves semi-terete, rather acute; fructiferous perianth transversely connate in the middle, somewhat membranaceous.

HAB. In New-York. Muhl.

Saltwort.

2. S. tragus Linn.: herbaceous, spreading, smooth; leaves subulate, spinose, fleshy; flowers solitary, axillary, bracteate; perianth subovate; margin flattened, discoloured.

HAB. N. J. and Md. Muhl. July. Q.-Dr. Torrey thinks

Muhlenberg's plant is S. kali.

3. S. kali Linn.: herbaceous, decumbent; leaves subulate, spinose, rough; flowers axillary, solitary; fruit-bearing perianth with a searious margin.

b. caroliniana Nutt.: leaves dilated; perianth with a broader mar-

gin; stem smooth.—S. caroliniana Walt. Mich.

Hab. Sea coast. N. Y. to Car. Aug, Sept. . . Stem much branched, diffuse. Flowers succulent, sessile, with 2 or 3 bracts at the base of each.

6. BLITUM. Linn.

Perianth 3-cleft. Stamens 1. Styles 2. Seed 1, covered by the calyx, which becomes a berry. Monandria. Digynia.

1. B. capitatum Linn.: procumbent; leaves triangular-hastate;

heads of flowers alternate, in a leafless terminal spike.

HAB. Fields and margins of swamps. N. Y. to Virg. N. to Subarc. Amer. June, July. .—Stem a foot high, branched. Heads round, sessile, consisting of numerous minute flowers, becoming red, resembling a strawberry.—Abundant near Rome, N. Y.

Strawberry Blite.

- 2. B. virgatum Linn.: leaves triangular-hastate; heads scattered, lateral.
 - Hab. Fields, &c. N. S. June. Q.—Leaves with large sinuate teeth. Heads of flowers axillary, always lateral, becoming red. Introduced.
- 3. B. maritimum Nutt.: perianth membranaceous; clusters axiliary, spiked, naked; leaves lanceolate, attenuated at each extremity, incisely toothed.

IIAB. Salt marshes near N. Y. Aug. Q.—Stem erect, 1—2 feet high, much branched. Leaves with a few large teeth, succulent. Calyx not becoming red.—Resembles an Atriplex.

ORDER XCIX. PHYTOLACCEÆ. Lind.

Perianth 4—5-petaloid leaves. Stamens either indefinite, or, if equal to the number of the divisions of the calyx, alternate with them. Ovary of 1 or several cells, each containing 1 ascending ovule. Styles and stigmus equal in number to the cells. Fruit berried or dry, indehiscent. Seeds ascending, solitary; embryo cylindrical, curved round mealy albumen; radicle next the hilum.

Undershrubs or herbs. Leaves alternate, without stipules, often with pellucid dots.

1. PHYTOLACCA. Linn.

Perianth 5-parted, petaloid. Stamens 7—20. Styles 5—10. Berry superior, 10-celled; cells 1-seeded.

Decandria. Decagynia.

P. decandra Linn.: leaves ovate, acute at each end, alternate, petiolate; flowers in simple racemes, with 10 stamens and 10 styles; globose-depressed, purple when mature.

HAB. Borders of fields. Can. to Car. June—Oct. 21.—Root very large. Stem 4—8 feet high, succulent, purplish. Florers whitish, in long pedunculated racemes. Peduneles red. Berries

globose-depressed, purple when mature.—The root is a violent emetic. Big. Med. Bot. i. 39.

Poke Weed.

2. RIVINA. Linn.

Perianth 4-parted, persistent. Stamens 4, 8 and 12. Style 1. Berry 1-seeded. Seed lentiform, scabrous.

Tetrandria. Monogynia.

R. lævis Linn.: leaves alternate, on long petioles, ovate, acuminate, smooth; flowers in simple axillary racemes.

HAB. Penn. Muhl. Sept. 5.—A shrub with the habit of Phytolacca decandra. Leaves alternate, entire. Flowers in axillary racemes.

ORDER C. POLYGONEÆ. Lind.

Perianth divided, inferior; æstivation imbricate. Stamens definite, inserted in the bottom of the perianth; anthers bursting longitudinally. Ovary superior, with a single erect ovule. Styles or stigmas several. Fruit a nut, usually triangular, naked or covered by the enlarged perianth. Seed with farinaceous albumen, rarely with scarcely any; embryo inverted, generally on one side; radicle superior.

Herbs, rarely shrubs. Leaves alternate, sheathing at the base or adhering there to intrafoliaceous stipules, revolute when young. Flowers occasionally diclinous.

1. POLYGONUM. Linn.

Perianth 4—6-parted, petaloid, persistent. Stamens 5—9, often 8. Styles 2—3. Nut one-seeded, mostly triangular.

Octandria. Trigynia.

- * Flowers axillary. Stamens 8. Stigmas 3. Polygonum.
- 1. P. aviculare Linn.: stem procumbent, herbaceous; leaves elliptic-lanceolate, rough on the margin; nerves of the stipules distant.
 - Hab. Waste places. N. Y. to Car. N. to Subarc. Amer. May —Sept. ©.—Stem much branched, nearly erect. Leaves varying much in size and shape.—When growing near the sea the leaves are glaucous and rather fleshy, and then forms P. glaucum of Nuttall. This fact is noticed by Dr. Smith, in his Fl. Brit., and by Dr. Greville in his Flora Edinensis.

 Knot Grass.
- 2. P. erectum Muhl.: stem mostly erect; leaves broad, oval, petiolate, smooth; flowers pentandrous.—P. aviculare var. latifolium Mich. Torr.
 - Hab. Near cultivated grounds. N. S. N. to Subarc. Amer. Aug. 21.—Stem 1—3 feet high. Flowers greenish.—Dr. Dar-

lington concurs in the opinion expressed by Muhlenberg, that this is a distinct species.—Fl. Ces.

3. P. tenue Mich.: stem slender, erect, branched, acutely angled; leaves linear, acuminate, straight; stipules tubular, lacerate, with the segments finely attenuate at the extremity; flowers alternate, subsolitary, on very short pedicels .- P. linifolium Muhl.

HAB. On rocks. N. S. July. @.—Stem 6-10 inches high. Flowers small, white, solitary and in pairs. Nut acutely triangu-

lar, shining, black.

- ** Flowers in terminal solitary spikes. Stamens 9. Stigmås 3. BISTORTA.
- 4. P. viviparum Linn.: stem simple; spike linear, solitary; leaves linear-lanceolate, revolute on the margin; the lower ones elliptical, petiolate.
 - HAB. Can. and White Hills, N. H. N. to Arc. Amer. Aug. 21.—Stem 6 inches high. Spike often bearing red bulbs instead of flowers.
- *** Flowers in axillary or terminal spikes. Stamens 5-8. Stigmas mostly 2. Persicaria.
- 5. P. punctatum Ell.: stem branched, sometimes decumbent at base; leaves lanceolate, with pellucid punctures, scabrous on the margin and midrib; stipules slightly hairy, ciliate; spikes few-flowered, filiform, at first cernuous; flowers octandrous, glandular-punctate; styles 3-parted .- P. hydropiper Mich .- P. hydropiperoides Pursh ..

HAB. Inundated grounds. Can. to Car. Aug., Sept. @-Stem 1-2 feet high. Flowers white, in one or two slender simple spikes. Nut 3-angled. Plant very acrid. Water Pepper.

6. P. mite Pers.: stem hairy at the summit; leaves narrow-lanceolate, acuminate, entire, somewhat hairy; stipules hairy, with long ciliæ; flowers octandrous, in crowded spikes; styles 3-parted .- P. hydropiperoides Mich .- P. barbatum Walt.

HAB. Ditches and ponds. Can. to Car. July-Sept. .-Stem 18 inches high. Flowers purple, in somewhat crowded spikes. Leaves not acrid.

7. P. virginianum Linn.: stem. simple, angular, hairy towards the top; leaves broad-lanceolate, acuminate, with fringed serratures; flowers 4-cleft, unequal, remote, pentandrous; styles 2; spike very long, slender, naked .- P. bistorta Walt.

HAB. Shady woods. Can. to Flor. W. to Miss. July, Aug. 21.-Stem 2-4 feet high. Leaves large, with hairy stipules.

Flowers white, in a very long and slender spike.

8. P. amphibium Linn.: stem nearly erect; leaves petiolate, oblonglanceolate, sometimes cordate at base; flowers in dense terminal spikes, pentandrous; styles bifid.—P. eoecineum var. terrestre Pursh.

b. aquaticum Hook .: stem spreading on the surface of water: leaves ovate-lanceolate, cordate; spike cylindrical-oblong. -P.

natans Eaton.

HAB. Borders of swamps and ponds. N. S. W. to Miss. July.

- 21.—Stem 8—12 inches long. Flowers large, reddish, in an ovate spike.—Var. b. has the stems long and the leaves broad-cordate and floating; but it passes into the former variety.
- 9. P. pennsylvanicum Linn.: stem with tumid joints, smooth; leaves lanceolate, slightly hairy, petioled; stipules smooth and naked; flowers in crowded oblong spikes, octandrous; style 2-cleft; peduncles hispid.
 - HAB. Margins of ponds and ditches. N. Y. to Car. July—Sept. @.—Stem 2—4 feet high, geniculate. Flowers large, reddish, in crowded spikes.
- 10. P. lapathifolium Linn.: stem geniculate, smooth; leaves ovate-lanceolate, on short petioles, often hoary beneath; spikes numerous, rather crowded, erect; peduncles scabrous; flowers hexandrous; styles 2.—P. incarnatum Ell.
 - Hab. Ditches and swamps. N. Y. to Car. Aug., Sept. O.—
 Stem 2—3 feet high. Flowers white or pale red, smaller than in
 the former.
- 11. P. persicaria Linn.: stem erect; leaves on short petioles, lanceolate, the upper surface marked with dark coloured spots; stipules smooth, ciliate; spikes dense, terminal, ovate-oblong, erect; flowers hexandrous; styles bifid.
- 12. P. orientale Linn.: stem erect; leaves very large, petioled, ovate, acuminate, minutely pubescent; stipules hairy, hypocrateriform; flowers in crowded terminal spikes, hexandrous, digynous.

 - **** Flowers in panicled spikes. Perianth 5-parted. Polygonella.
- . 13. P. articulatum Linn.: stem erect; leaves linear, obtuse; stipules short, truncate; spikes paniculate, filiform, erect; pedicels solitary, articulate near the base; flowers perfect, octandrous, trigynous, nodding.
 - Hab. Sandy plains. N. S. W. to Michigan. Sept. @.—
 Stem 12 inches high, branched above. Leaves very small, linear.
 Flowers reddish-white, in spikes which are jointed by a succession of imbricate sheathing bracts.—A singular plant which should perhaps be separated from this genus.
- ***** Flowers in racemose panicles. Leaves subcordate or sagittate.

 FAGOPYRUM.
- 14. P. sagittatum Linn.: stem prostrate, square; the angles awned with reversed prickles; leaves sagittate, acute, nearly sessile; flowers in small peduncled heads, octandrous; styles 3-cleft.
 - HAB Wet grounds. N. Y. to Flor. July, Aug. S .- Stem

long and slender. Flowers white, axillary and terminal, in small compact heads which are supported on long peduncles.

15. P. arifolium Linn.: stem prostrate, square, the angles with reversed prickles; leaves on long petioles, hastate, with the lobes acute; spikes few-flowered; flowers hexandrous, distinct; styles bifid.

HAB. Wet grounds. Can. to Car. Aug., Sept. . Stem flexuous, prostrate or climbing. Flowers pale red, in terminal

and axillary spikes.

16. P. convolvulus Linn.: stem long, climbing, angular, somewhat rough; leaves petioled, oblong, hastate-cordate, with the lobes spreading and acute; flowers in lax spikes, octandrous; styles 3-cleft; segments of the perianth bluntly keeled.

HAB. Cultivated grounds. Can. to Car. July—Sept. . Stem long, climbing. Flowers whitish or reddish, in terminal

interrupted spikes or racemes.

17. P. cilinode Mich.: stem angular, climbing or prostrate, pubescent; leaves petioled, cordate; stipules somewhat acute, ciliate at the base; panicles somewhat leafy; flowers octandrous; styles 3-cleft; segments of the periantin blundy booled.

HAB. Fields. N. S. July, Aug. . .- A variety of the last. ?

18. P. seandens Linn.: stem climbing, smooth; leaves broad-cordate, with the sinus broad and obtuse; stipules truncate, naked; flowers large, in axillary racemes, octandrous, trigynous; segments of the perianth winged.

HAB. Shady woods. N. Y. to Car. W. to Miss. July, Aug. . Stem purple. Flowers white or reddish, in axillary racemes.

19. P. fagopyrum Linn.: stem erect, unarmed; leaves cordate, sagittate; racemes panicled; angles of the seed equal.

Hab. Fields; remaining as a weed where it has been cultivated.

June.

Buckwheat.

2. RUMEX, Linn.

Perianth 6-leaved. Stamens 6. Styles 3. Nut triquetrous, covered by the 3 interior valviform leaves of the perianth. Stigmas many-cleft. Hexandria. Trigynia.

- * Flowers all perfect, containing both stamens and pistils. IAPATHUM.

 † Inner valves of the perianth entire.
- 1. R. aquaticus Linn.: valves ovate, entire, all of them granuliferous; leaves lanceolate, acute, the lower ones on long petioles and cordate at base.
 - Hab. Ponds and ditches. N. S. July, Aug. 21.—Root large and very astringent. Stem 3—4 feet high. Flowers whorled, in a terminal leafy panicle. Introduced.? Water Dock.
- 2. R. crispus Linn.: valves very large, cordate, entire, veined, granuliferous; leaves lanceolate, acute, waved at the margin.

- HAB. Fields. Can. to Car. June, July. 21.-Stem 2-3 feet high, furrowed. Flowers in crowded whorls, on pedicels .- Distinguished from the former by its large membranaceous valves. Curled Dock. Introduced.
- 3. R. sanguineus Linn.: valves small, oblong, one or more granuliferous; leaves lanceolate, somewhat cordate, petioled, smooth, mostly with red veins.
 - HAB. Fields and road sides. Can. to Car. June, July. 24.—

 Stem 3 feet high. Root leaves large, with blood-red veins.

 Flowers in small distant whorls. Introduced. Bloody Doek.
- 4. R. britannicus Linn.: valves all entire and granuliferous; leaves broad-lanceolate, flat, smooth; sheaths obsolete; whorls of flowers leafless.
 - HAB. Swamps. Can. to Car. June, July. 21.-Root fusiform, yellow internally. Stem 3 feet high. Leaves large, on petioles. Flowers in a compound terminal panicle, polygamous.

Yellow-roated Water Dock.

5. R. verticillatus Linn.: valves entire, all of them granuliferous; flowers whorled, in long nearly simple leaness racemes; leaves lanceolate, acute, flat; sheaths cylindrical.

AB. Swampy grounds. N. S. June, July. 21.—Stem 2 feet high. Leaves long, lanceolate, narrow. Whorls few-flowered. Pedicels half an inch or more in length.

†† Inner valves of the perianth toothed.

6. R. acutus Linn.: valves oblong, somewhat toothed, all granuliferous; leaves cordate-oblong, acuminate; whorls numerous, small, leafy.

HAB. Moist grounds. N. S. June. 2f .- Stem 2-3 feet high. Introduced.

7. R. pallidus Big.: valves ovate, entire, hardly larger than the grain; leaves linear-lanceolate, acute; spikes slender.

Hab. Salt marshes. Mass. June. 21.—Stems numerous, ascending, slightly furrowed. Leaves smooth, petioled, more or less waved on the margin. Spikes slender. Fruit crowded, the valves acute.

8. R. obtusifolius Linn.: valves ovate, toothed, one chiefly granuliferous; leaves cordate-oblong, obtuse, somewhat crenate and waved; upper ones narrower and more acute; stem roughish.

HAB. Woods and fields. N. S. July. 21.—Stem 2-3 feet high. Leaves very large. Flowers in long nearly leafless racemes. In-

troduced.

** Flowers dioceious. ACETOSA.

9. R. aeetosella Linn.: leaves lanceolate, hastate; lobes acute, spreading; racemes paniculate; valves of the fruit grainless.

HAB. Fields, &c. Throughout the U. S. June, July. 21 .-Stem 6-12 inches high.—The plant has a pleasant acid taste. Sheep Sorrel.

ORDER CI. LAURINEÆ. Juss. Lind.

Perianth 4-6-cleft. Stamens definite, perigynous, opposite the segments of the perianth and usually twice as numerous, 3 innermost ones sterile, or wanting; 6 outer ones scarcely ever abortive; anthers adnate, 2-4-celled, the cells bursting by a longitudinal persistent valve from the base to the apex; the outer anthers valved inwards, the inner outwards. Glands usually present at the base of the inner filaments. Ovary superior, single; style simple; stigma obtuse. Fruit a berry or drupe, naked or covered. Seed without albumen; embryo inverted; cotyledons, large, plano-convex, peltate near the base. Plumula conspicuous, 2-leaved.

Trees, often large. Leaves without stipules, alternate.

1. LAURUS, Linn.

Perianth 4-5-cleft, equal. Stamens 8-12, arranged in a double row; outer ones all fertile; alternate inner ones fertile and furnished at base with 2 appendices or glands, (nectary.) Drupe tleshy. Enneandria. Monogynia.

* Leaves perennial.

1. L. carolinensis Mich.: leaves oval-lanceolate, coriaceous, glaucous beneath; peduncles simple, terminated with a few-flowered fascicle; outer segments of the calvx half as long as the inner.

HAB. In the Great Cypress Swamp, Sussex county, Delaware; . its most northern boundary. Nutt. S. to Geor. June. 5.—A large shrub or small tree. Flowers in small clusters, polygamous, pale yellow. Drupe dark blue.

** Leaves deciduous. Flowers dioecious.

2. L. benzoin Linn.: leaves obovate, lanceolate, wedgeform at base, entire, whitish and subpubescent beneath; flowers in clustered umbels, appearing before the leaves; buds and pedicels smooth.-L. pseudobenzoin Mich.

HAB. Banks of streams. Can. to Geor. W. to Miss. April, May. 5.—Shrub 6—10 feet high. Flowers pale yellow. Drupe roundish, scarlet. Benzoin. Spice-wood.

3. L. sassafras Linn.: leaves entire, lanceolate-ovate, or 2-3-lobed, under surface prominently veined; flowers in clustered umbels, appearing before the leaves; buds, younger branches and under surface of the leaves, pubescent.

HAE. River banks. Can. to Geor. April. V.—Varies in size from that of a large shrub to a large tree. Leaves various, glabrous or pubescent. Flowers yellow.—This and the foregoing species possess medicinal powers. See Dr. Brockenbrough's In-

augural Thesis, 1804. Barton's Collection for a Mat. Med. of the U. S. and Big. Med. Bot. ii. 142. Sassafras.

ORDER CII. ELÆAGNEÆ. Juss. Lind.

Flowers dioecious, rarely monoclinous. Sterile Fl. Stamens 3, 4 or 8, sessile; anthers 2-celled. Fertile Fl. Perianth tubular, persistent; the limb entire, or 3—4-toothed. Ovary superior, simple, 1-celled; ovulc solitary, ascending, stalked; style short; stigma simple, subulate, glandular. Fruit crustaceous, enclosed within the perianth, becomes succulent. Seed erect; embryo straight, surrounded by very thin fleshy albumen; radicle short, inferior; cotyledons fleshy.

Trees or shrubs, covered with leprous scales. Leaves alternate or opposite, entire, without stipules.

1. SHEPHERDIA. Nutt.

Dioecious. Sterile Fl. Perianth 4-cleft. Stamens 8, included, alternating with 8 glands. Fertile Fl. Perianth 4-cleft, campanulate, superior. Style 1. Stigma oblique. Berry 1-seeded.

Dioecia. Octandria.

S. canadensis Nutt.: leaves oblong-ovate, nearly smooth above, stellately hairy and scaly beneath; the scales ferruginous and deciduous.—Hippophae canadensis Willd. Pursh.

HAB. Can. and Western part of N. Y. N. to Arc. Amer. July. b.—A shrub 6--8 feet high. Flowers minute. Berries scaly,

sweetish.

ORDER CHI. THYMELEÆ. R. Brown. Lind.

Perianth inferior, tubular, coloured; the limb 4-seldom 5-cleft; æstivation imbricate. Stamens definite, periginous, usually 8, sometimes 4 or 2; anthers 2-celled. Ovary solitary; style 1; stigma undivided. Fruit a nut or drupe; albumen none, or thin and fleshy; embryo straight, inverted; cotyledons plano-convex.

Shrubs with a tough bark. Leaves alternate or opposite, entire.

1. DIRCA. Linn.

Perianth coloured, campanulate; limb obsolete. Stamens 8, inserted into the perianth, unequal. Style 1. Berry 1-seeded. Octandria. Monogynia.

D. palustris Linn.

HAB. Woods. Can. to Geor. April. 21.—Shrub 2—4 feet high, with tough branches. Leaves alternate, ovate, petioled, entire, obtuse. Flowers appearing before the leaves, yellow.—The bark has a sweetish taste, and when chewed excites a burning sensation in the fauces.

Leather Wood.

ORDER CIV. SANTALACEÆ. Brown. Lind.

Perianth superior, 4 or 5-cleft, half coloured, with valvate estivation. Stamens 4 or 5, opposite the segments of the perianth and inserted into their bases. Ovary 1-celled, with from 1—4 ovules; style 1; stigma often lobed. Fruit a nut or drupe. Seed solitary; albumen fleshy; embryo minute; radicle superior.

Trees or shrubs sometimes undershrubs or herbs. Leaves alternate, undivided.

1. NYSSA. Linn.

Dioecious. Sterile Fl. Perianth 5-parted. Stamens 5.
10. Fertile Fl. Perianth 5-parted. Stamens 5.
Style 1. Drupe inferior. Dioecia. Pentandria.

1. N. multiflora Walt.: leaves oval-lanceolate, very entire, acute at each end; the petiole margined and midrib villous; fertile peduncles many-flowered.—N. villosa Mich.

HAB. Low woods. Can. to Car. June. 5.—A tree 30—50 feet high. Flowers in somewhat umbellate clusters, small, green. Drupe nearly spherical, very dark blue.

Sour or Black Gum.

2. N. biflora Walt.: leaves ovate-oblong, very entire, acute at each end, smooth; fertile peduncles 2-flowered; drupe oval-compressed.—
N. aquatica Linn.

Hab. Swamps. N. S. S. to Car. June. 5.—A tree 30—50 feet high. Fertile flowers almost invariably 2. Drupe dark blue.

—The woody fibres of this tree are remarkably interlocked, so as to render it difficult to be split; on this account it is much used in making naves for carriage wheels, &c.

Tupelo Trce. Swamp Hornbeam.

2. HAMILTONIA. Willd,

Polygamous. Perfect Fl. Perianth turbinate-campanulate, 5-cleft. Germ immersed in the 5-toothed glandulous disk. Style 1. Stigmas 2-3, sublenticular. Drupe pyriform, 1-seeded, inclosed in the adhering base of the calyx. Sterile Fl. resembling the perfect, except in wanting the pistil.

Pentandria. Monogynia.

H. oleifera Muhl. - Pyrularia pubera Mich.

Hab. Mountains. Penn. to Geor.; rare. May, June. 5.—
Shrub 4—6 feet high with a very deep root. Leaves oblong-obovate, entire, acuminate, 2—3 inches long, petiolate, pubescent
when young. Flowers in a terminal raceme, small, greenishyellow.—Whole plant more or less oily.

Oil Nut.

3. THESIUM. Linn.

Perianth 4-5-cleft. Stamens 4-5, opposite the lobes of the perianth, villous externally. Style simple, 1-seeded, crowned by the persistent perianth. Pentandria. Monogynia.

T. umbellatum Linn.: stem round and erect; leaves oblong-ovate, obtuse, smooth; panicles terminal, subcorymbed.—Comandra umbel-

lata Nutt.-Hamiltonia umbellata Spreng.

HAB. Rocky hills. Subarc. Amer. to Geor. W. to Miss. July, Aug. 21.—Stem 8—12 inches high. Leaves alternate, entire, sessile, mucronate. Flowers white, in a terminal corymb.—It is still doubtful whether this deserves to be separated from Thesium. It appears to agree very well with Hamiltonia.

Bastard Toad-flax.

ORDER CV. ARISTOLOCHIÆ. Juss. Lind.

Flowers monoclinous. Perianth superior, tubular, 3-cleft, regular or very unequal; astivation valvate. Stamens 6—12, epigynous, distinct or adhering to the style and stigmas. Ovary inferior, 3—6-celled; ovules numerous; style simple; stigmas radiating, as numerous as the cells of the ovary. Fruit dry or succulent, 3—6-celled. Seeds numerous; embryo minute, placed in the base of fleshy albumen.

Herbs or shrubs. Leaves alternate, simple, often with leafy

stipules.

1. ARISTOLOCHIA. Linn.

Perianth tubular, ventricose at base, dilated at the apex and ligulate. Anthers 6, subsessile, inserted into the style. Stigma 6-cleft. Capsule 6-sided, 6-celled.

Gynandria. Hexandria.

1. A. sipho L'Herit: stem twining; leaves cordate, acute; peduncles 1-flowered, furnished with an ovate bract; corol ascending, the border 3-cleft and equal.

Hab. Mountains. Penn. to Car. June. b.—A vine climbing over trees of large size. Leaves very large, alternate, sprinkled with hairs. Flowers solitary, brown. Dutchman's Pipe.

2. A. serpentaria Linn.: stem flexuous; leaves cordate, oblong, acuminate; peduncles radical; lip of the corol lanceolate.

Hab. Shady woods. Penn. to Car. June. 21.—Stem 8—12 inches high, pubescent, geniculate and knotty at base. Flowers few, purplish-brown.—Possesses valuable medicinal properties. See Big. Med. Bot. iii. 82. Virginia Snakeroot.

2. ASARUM. Linn.

Perianth campanulate, 3-cleft. Stamens 12, placed upon the ovary; anthers adnate with the middle of the filaments. Style short. Stigma stellate, 6-lobed. Capsule 6-celled.

Gynandria. Decandria.

1. A. canadense Linn.: leaves by pairs, broad reniform; perianth woolly, cleft to the base; the segments sublanceolate, reflexed.—A. carolinianum Walt.

HAB. Woods. Can. to . Car. W. to Miss. April. 21.—Stem none. Leaves generally 2, with long and hairy petioles. Flower somewhat campanulate, solitary, on a short peduncle, sometimes nearly buried in the ground.—The root has an agreeable and aromatic flavor.

Wild Ginger.

2. A. virginicum Mich.: leaves solitary, cordate, nearly round, glabrous, coriaceous; flower nearly sessile; perianth externally glabrous, short, campanulate.

Hab. Rocky woods. N. J. to Car. April. 21.—Leaves spotted or clouded, smooth. Segments of the perianth obtuse.—Very similar in habit to the preceding.

ORDER CVI. EMPETREÆ. Nutt. Lind.

Flowers dioecious. Perianth consisting of 2—4 imbricated rows of hypogynous scales. Stamens equal in number to the scales and alternate with them; anthers roundish, 2-celled, the cells distinct, bursting longitudinally. Ovary superior, seated in a fleshy disk, 3—6 or 9-celled; ovules solitary, ascending; style 1; stigma radiating, multifid. Fruit fleshy, seated in the persistent perianth. Seed solitary, ascending; embryo taper in the axis of the fleshy albumen; radicle inferior.

Small acrid shrubs, with heath-like evergreen leaves without stipules, and minute flowers in their axils.

1. EMPETRUM. Linn.

Dioecious. Perianth consisting of 2 rows of scales. Ste-BILE FL. Stamens 3, upon long filaments. Fertile FL. Style none, or very short. Stigma with 6-9 rays. Berry superior, globose, 6-9 seeded. Dioecia. Triandria.

E. nigrum Mich.: procumbent; leaves oblong-obtuse, revolute on

the margin.

Hab. White Hills. N. H. Big. N. to Arc. Amer. May, June. 5.—A low shrub with small and dense evergreen foliage, like that of the heaths. Leaves imbricate, oblong, obtuse. Flowers axillary, very small, reddish. Berries roundish, black.—Dr. Houghton has found it on the shores of Lake Superior.

ORDER CVII. EUPHORBIACEÆ. Lind.

Flowers monoecious or dioecious. Perianth lobed, inferior, with various glandular or scaly appendages; (sometimes wanting.) Sterile Fl. Stamens 1—12; anthers 2-celled. Fertile Fl. Ovary 1, superior, sessile or stalked; styles 2—3; stigmas compound; or single with several lobes. Fruit consisting of 2—3 or more dehiscent cells, separating with elasticity from their commor axis, sometimes indehiscent. Seeds suspended, arillate; embryo enclosed in fleshy albumen; cotyledons flat; radicle superior.

Trees, shrubs or herbs, often abounding in acrid milk.

Leaves simple, rarely compound, usually with stipules.

1. CROTONOPSIS. Mich.

Monoecious. Sterile Fl. Perianth 5-parted, with 5 petaloid scales. Stamens 5. Fertile Fl. Perianth 5-parted. Stamens 3, twice bifid. Capsule 1-seeded, not opening.

Monoecia. Pentandria.

C. linearis Mich.: stem erect, dichotomously branched; leaves stellately pubescent above, hairy and covered with silvery scales beneath.

E. argentea Pursh .- Friesia argentea Spreng.

2. PHYLLANTHUS. Linn.

Monoecious. Sterile Fl. Perianth 5-6-parted. Filaments united. Fertile Fl. as the sterile. Nectary? a 12-angled margin. Styles 3. Capsule 3-celled.

Monoecia. Monadelphia.

P. caroliniensis Walt.: stem erect; branches distichous; leaves alternate, oval, obtuse, smooth, somewhat distichous; flowers few, (2-4) axillary, on pedicels, nodding.—P. obovatus Willd. Pursh. Torr.

HAB. Banks of streams. Penn. to Geor. July, Aug. 3.—
Stem 12 inches high, with distichous branches. Flowers on short
pedicels, axillary, nodding. Stamens 6, united at base.

3. RICINUS. Linn.

Monoecious. Sterile Fl. Perianth 5-parted. Stamens numerous; filaments united, branching. Fertile Fl. Perianth 3-parted. Styles 3, 2-parted. Capsule mostly echinate, 3-celled, 3-seeded.

Monoecia. Monadelphia.

R. communis Linn.: stem herbaceous, glaucous-pruinose; leaves peltate palmate; lobes lanceolate, serrate; capsule echinate.

Hab. Around plantations at the South. Aug., Sept. 2.—Introduced. Cultivated extensively in various parts of the U.S. for the purpose of obtaining oil from the seed. Castor-oil Bean.

4. ACALYPHA. Linn.

Monoccious. Sterile Fl. Perianth 3—4-parted. Stamens 8—16, united. Fertile Fl. Styles 3, 2-parted. Capsule 3-celled; cells 1-seeded. Monoccia. Monadelphia.

1. A. virginica Linn.: pubescent; leaves on short petioles, lanceolate-oblong, remotely and obtusely serrate; involucre cordate, ovate, acuminate, toothed; fertile flowers at the base of the sterile spike.

Hab. Road sides, &c. Can. to Car. June—Aug. . —Stem 12—18 inches high, erect, pubescent. Involuce on a short peduncle, shorter than the leaves. Sterile flowers very small. Capsule hispid.

Three-seeded Mercury.

2. A. caroliniana Walt.: leaves on long petioles, rhombic-ovate, acuminate, serrate, entire at base; involucre cordate, toothed; fertile flowers at the base of the sterile spike.

HAB. Fields. Penn. to Car. July, Aug. @.—Stem 9-18 inches high.—The A. carolinana of Elliott is apparently a distinct species.

5. EUPHORBIA. Linn.

Monoecious. Rarely furnished with a perianth. Involucre monophyllous, campanulate, 8—10 toothed, the inner segments membranaceous and erect. Sterile Fl. 12 or more. Stamen 1; filament articulated in the middle. Fertile Fl. solitary, stipulate, naked. Stigmas 3, 2-cleft. Capsule 3-lobed.

Monoecia. Monandria.

* Flowers in terminal fascicles.

1. E. dentata Mich.: hairy; leaves opposite, oval, dentate; flowers crowded at the summit of the stem.

- HAB. Shady rocks. Penn. to Tenn. July, Aug. .—The upper leaves spotted.
- 2. E. hypericifolia Linn.: smooth, branching, erect-spreading; branches divaricate; leaves opposite, oval-oblong, slightly falcate, serrate; corymbs terminal.

b. ? hirsuta Torr.: stem slender or hairy; leaves oblong, smooth,

serrulate.

- HAR. Fields and road sides. Can. to Flor. Aug., Sept. ©.—
 Stem erect, 1-2 feet high, very smooth. Leaves 3-nerved
 and spotted. Flowers small.—Var. b. is 8-12 inches high,
 much branched and purple.
- 3. E. maculata Linn.: erect-spreading or procumbent; leaves opposite, serrate, oblong, hairy; flowers axillary, solitary; inner segments of the involucre coloured.
 - Hab. Near cultivated grounds. N. Y. to Car. Aug.—Oct. ©. Stem 6—12 inches long, generally purple. Leaves on short petioles, oblique at base, 3-nerved. Flowers crowded near the summit, but in reality solitary in each axil. Spotted Spurge.
- 4. E. polygonifolia Linn: procumbent, branching, very smooth, succulent; leaves oblong-ovate, linear-lanceolate, entire, obtuse, sometimes subcordate at base; flowers solitary in the divisions of the stem; stipules simple.

HAB. Sands on sea shore. N. Y. to Car. July, to Sept. -24.
—Stem 8 inches long. Stipules subulate and simple.

5. E. ipecacuanha Linn.: procumbent or nearly erect, small, smooth; leaves opposite, obovate and lanceolate; peduncles axillary, 1-flowered, elongated.

HAB. Sandy soil. N. J. to Car. June. 21.—Root very long and tapering. Stem short. Leaves sessile, varying in form from obovate to linear. Flowers solitary, on peduncles which are about as long as the leaves.

ν. E. portulaecoides Linn.: erect; leaves entire, oval, retuse; peduncles axillary, 1-flowered, as long as the leaves.

HAB. Sandy soils. Penn. June—Aug. 21.—Dr. Torrey thinks it may be a variety of E. eorollata.

7. E. dentata Mich.: hairy; leaves opposite, oval, dentate; flowers crowded at the summit of the stem.

HAB. Shady rocks. N. S. Torr. Tenn. Mich. July, Aug. . Upper leaves spotted.

** Flowers umbelled-involuerate.

8. E. peplus Linn.: umbel 3-cleft, dichotomous; involucels (floral leaves) ovate; leaves entire, obovate, petioled.

HAB. Cultivated grounds. Penn. to Vir. July, Aug. .—
Floral leaves large. Flowers conspicuous.

9. E. obtusata Pursh: umbel 3-cleft, twice dichotomous; involucels ovate, somewhat obtuse, subcordate; leaves alternate, sessile, spatulate, serrulate, smooth; capsules muricate.

- HAE. Waste grounds. Can. to Vir. July, Aug. 24.—Stem 12—18 inches high, branched at the top, simple below.
- 10. E. mercurialina Muhl.: stem weak and slender, simply 3-cleft; leaves opposite and ternate, subsessile, oval, entire; peduncles terminal, solitary, 1-flowered.

HAB. Shady rocky situations. Penn. Pursh. July, Aug. 24.

11. E. lathyrus Linn.: umbel 4-cleft, dichotomous; leaves opposite, lanceolate, entire.

Hab. Near gardens and cultivated grounds. N. S. July, Aug. 3.—Introduced. Mole Plant.

12. E. corollata Linn.: umbel 5-cleft, 3-cleft, dichotomous; floral leaves and those of the stem oblong, obtuse; inner segments of the involucre petaloid, obovate.

HAG. Dry fields. Can. to Car. July, Aug. 21.—Stem 1—2 feet high, erect, rarely branched. Leaves petioled, varying somewhat in form. Flowers in a terminal umbel, conspicuous.

13. E. pilosa Linn.: umbel 5 cleft, 3-cleft, blifid; floral leaves ovate; stem leaves lanceolate, somewhat hairy, serrulate at the summit; petals entire.

Hab. Wet woods. Can. to Vir. June, July. 24.—Stem 1—3 feet high.—Found in Canada by Mr. Goldie.

14. E. helioscopia Linn.: umbel 5-cleft, 2-cleft, dichotomous; floral leaves obovate; stem leaves cuneiform, serrate, smooth; capsule smooth.

ORDER CVIII. URTICEÆ. Lind.

Flowers monoecious or dioecious, scattered or clustered. Perianth membranous, lobed, persistent. Stamens definite, distinct, inserted into the base of the calyx and opposite its lobes. Ovary superior, simple; stigma simple. Fruit a simple indehiscent nut, surrounded either by the membranous or floshy perianth. Seed solitary, erect; embryo straight, curved or spiral; radicle superior.

Trees, shrubs or herbs, with alternate leaves, often covered

with pungent hairs.

1. URTICA. Linn.

Monoccious, rarely dioecious. Sterile Fl. Perianth single, of 4 leaves, containing the cup-shaped rudiment of a germ. Stamens 4. Fertile Fl. Perianth of 2 leaves. Stigma 1. Nut 1-seeded, shining. Monoecia. Tetrandria.

1. U. pumila Linn.: leaves opposite, ovate, acuminate, 3-nerved, serrate; lower petioles as long as the leaves; flowers monoecious, triandrous, in clustered corymbs, shorter than the petioles.

HAB. Wet grounds. Can. to Car. July. . Stem mostly erect, 6-12 inches high, succulent, almost transparent. Leaves

2. U. urens Linn.: leaves opposite, elliptic, somewhat 5-nerved. acutely serrate; spike glomerafe, by pairs; flowers clustered.

Hab. Cultivated grounds. Can. to Geor. June, July. S.—Stem 12—20 inches high, hairy-hispid. Plant stinging. Introduced. · Stinging Nettle.

U. dioica Linn.: leaves opposite, cordate, ovate-lanceolate, coarsely serrate; flowers dioecious; spike paniculate, clustered, by pairs, longer than the petiole.

HAB. Waste places. Can. to Car. June-Aug. 24.-Stem 2-3 feet high, erect, branching. Flowers small, green, in axillary racemes which are in pairs. Stinging.

Large Stinging Nettle.

4. U. procera Muhl.: leaves opposite, ovate-lanceolate, serrate; petioles fringed; flowers dioecious; spikes branching, clustered, by

pairs, longer than the petioles.

- HAB. Low grounds. N. Y. S. to Car. July, Aug. 21 .- Stem 3-4 feet high, obtusely 4-angled. Flowers in compact approximate clusters.—According to Mr. Elliott, the leaves of this species are never cordate, and the spikes are uniformly longer than the petioles, in which points it differs from the U. procera of Pursh, which would seem to be a distinct species, probably the next.
- 5. U. gracilis Linn.: stem hispid; leaves opposite, ovate-lanceolate, serrate, cordate at base; flowers dioecious; peduncles hispid; clusters in pairs, somewhat branched, about as long as the petioles. - U. procera Pursh.?

HAB. Rocky places. Can. to Penn. Pursh. Muhl. N. to Arc. Amer. July, Aug. 21.—Stem 2—3 feet high.

Stender Stalked Nettle.

6. U. capitata Linn.: leaves alternate, cordate-ovate, acuminate, serrate, 3-nerved, twice as long as the petiole; clusters spiked; spikes solitary, shorter than the leaves, leafy at the summit; stem naked.

HAB. Shady woods. Can. to Car. June. July. 21. - Stem 4-5 feet high, scabrous, furrowed. Leaves scabrous, those on the stem generally opposite. Clusters lateral and axillary .- Resembles U. dioica.

7. U. divarieata Linn.: leaves alternate, ovate, acuminate, serrate, rather smooth; petiolcs long, ciliate; panicles axillary, solitary, divaricately branched, longer than the pctiole; stcm stinging.

HAB. Damp rocky grounds. Can. to Car. July, Aug. 24.-Stem 2-3 feet high, branched .- Allied to the next species, but differs in the leaves being smooth and not cordate, the panicles

solitary and mixed with fertile flowers.

8. U. canadensis Linn.: leaves alternate, cordate-ovate, acuminate, serrate, hispid on both sides; panicles axillary, mostly in pairs, divaricately branched; the lower ones sterile, and longer than the petiole; the upper ones fertile, elongated; stem very hispid, stinging.

HAB. Miry shaded grounds. Can. to Car. July, Aug. 21.—
Stem 5—6 feet high. Leares ovate, large—The fibres of this
species are very tough and strong, and it was formerly proposed
by Mr. Whitlow as a substitute for hemp.
Canadian Nettle.

2. PARIETARIA. Linn.

Flowers polygamous, surrounded by a many-cleft involucre. Perfect Fl. Perianth 4-cleft. Stamens 4; filaments at first incurved, then expanding with an elastic force. Ovary 1. Style 1. Nut 1, inclosed by the enlarged perianth.

Monoecia. Tetrandria.

P. pennsylvanica Muhl.: leaves oblong-laneeolate, veiny, with opake dots; involvere 3-leaved, longer than the flower.

HAB. Moist rocks. Penn. to Geor. June. @.—Stem 12—15 inches high, simple. Flowers in compact axillary clusters.

Pellitory.

3. CANNABIS. Linn.

Dioecious. Sterile Fl. Perianth 5-parted. Stamens 5. Fertile Fl. Perianth oblong, opening at the side. Styles 2. Nut 2-valved, covered with the closed perianth.

Dioecia. Pentandria.

C. sativa Linn.: leaves petiolate, digitate; leafets 5-7, lanceolate, serrate.

HAB. In fields. June. O —Apparently indigenous, but probably introduced. Common Hemp. Neek Weed.

4. HUMULUS: Linn.

Dioccious. Sterile Fl. Perianth single, 5-parted. Stamens 5. Anthers with 2 pores at the extremity. Fertile Fl. Scales of the ament large, persistent, concave, entire, single flowered. Perianth none. Styles 2. Seed 1.

Dioecia. Pentandria.

H. lupulus Linn.

Hab. Hedges, &c. Aug. 24.—Stem twining, scabrous. Leaves opposite, 3—5-lobed, rough. Flowers greenish. Medicinal. Big. Med. Bot. iii. 163.

Common Hop.

5. BOEHMERIA. Willd.

Monoecious. Sterile Fl. Perianth 4-parted. Sta-

- mens 4. Fertile Fl. Perianth none. Style 1. Nut compressed. Monoecia. Tetrandria.
 - 1. B. cylindrica Willd.: leaves opposite, ovate-oblong, acuminate, toothed, smooth; flowers dioecious; sterile spikes clustered, interrupted; fertile ones cylindrical; stem herbaceous.

HAB. Wet ground. Can. to Flor. June—Aug. 21.—Stem 2—3 feet high. Leaves petioled, 3-nerved. Flowers minute; the fertile ones forming a compact cylindrical spike which is 1—2 inches long.

2. B. lateriflora Muhl.: leaves alternate, ovate-lanceolate, acuminate, serrate, scabrous; flowers lateral, clustered; stem herbaceous.

Hab. Shady woods. Penn. to Car. July. 21.—Stem smooth.

Leaves on long petioles, 3-nerved, scabrous on both sides. Clusters axillary and lateral, few-flowered.

ORDER CIX. ARTOCARPEÆ. R. Brown. Lind.

Flowers monoecious, in heads or aments. Perianth usually divided, sometimes tubular or entire. Stamens solitary or several, straight. Ovary 1- or 2-celled, superior, rarely inferior; ovule suspended; style single, filiform; stigma bifid. Fruit usually a fleshy receptacle, covered by numerous nuts, rarely reduced to a single flower. Seed suspended, solitary; embryo straight or curved; radicle pointing to the hilum.

Trees, shrubs or herbs. Leaves alternate, toothed or lobed, or entire.

1. MORUS. Linn.

Monoecious. Perianth 4-parted, lobes concave. Sterile Fl. Stamens 4. Fertile Fl. Stigmas 2. Seeds 1-2, covered by the fleshy perianth. Monoecia. Tetrandria.

1. M. rubra Linn.: dioecious; leaves eordate, ovate, acuminate, often 3-lobed, equally serrate, seabrous, pubescent beneath; fertile aments cylindrical; fruit purple.

Hab. Woods. N. S. to Car. May. b.—A large tree with long virgate branches. Leaves often divided. Flowers, according to Mr. Elliott, always dioecious.—The fruit is esteemed by some, and the wood is remarkably durable.

Red Mulberry.

2. M. alba Linn.: monoecious; leaves deeply cordate, unequal at base, ovate and lobed, unequally serrate, nearly smooth; fruit white.

Hab. Naturalized in various parts of the U. S. May. 5.—A tree from 20 to 30 feet high.—Employed chiefly in raising the silk worm.

White Mulberry.

ORDER CX. SAURUREÆ: Rich. Lind.

Flowers naked, seated upon a scale, monoclinous. Stamens 6, clavate, hypogynous, persistent; filaments slender; anthers continuous with the filament, cuncate, with a thick connecticum and 2 lateral lobes bursting longitudinally. Ovaries 4, each distinct, with 1 ascending ovule and a sessile recurved stigma, or connate into a 3 or 4-celled pistil, with a few ovules ascending from the edge of the projecting semi-dissepiments. Fruit consisting of 4 fleshy indehiscent nuts or 3- or 4-celled capsule, opening at the apex and containing a few ascending seeds. Seeds with a membranous integument; embryo minute, lying in a fleshy lenticular sac, which is seated on the outside of mealy albumen at the end most remote from the hilum.

Herbs growing in marshy places, or floating in water. Leaves alternate, with stipules.

1. SAURURUS. Linn.

Flowers in an ament, or crowded spike. Scales 1-flowered. Stamens 6. Anthers adnate with the filaments. Capsule 4, each 1- or rarely 2-seeded, not opening.

Hexandria. Tetragynia.

S. cernuus Linn .- Anonymos aquatica Walt.

HAB. Swamps. Can. to Car. Aug. 21.—Stem 1—2 feet high, leafy, forked above. Leaves sagittate-cordate, acuminate, nerved beneath. Flowers very small, greenish-white, in spikes opposite the leaves, cernuous.

Lizard's-tail. Swamp Lily.

ORDER CXI. AMENTACEÆ. Juss.

Flowers monoccious or dioccious. Sterile Fl. in aments, with scales, or a scaly perianth. Stamens inserted into the scales, definite or indefinite, rarely monadelphous; anthers 2-celled. Fertile Fl. in aments, solitary or fasciculated, with scales or perianths. Ouary free, simple, rarely several; stigmas many. Fruit a drupe, or a bony or membranaceous capsule, mostly 1-celled. Seeds 1 or many; albumen none; radicle straight.

Trees or shrubs. Leaves alternate.

SUBORDER I. SALICINEÆ..

1. SALIX. Linn.

Dioecious. Sterile Fl. Ament cylindrical. Scales 1-flowered, imbricated, with a nectariferous gland at the base. Perianth none. Stamens 1—5. Fertile Fl. Scales of the ament 1-flowered. Perianth none. Stigmas 2, often cleft. Capsule 1-celled, 2-valved, many-seeded. Seeds comose.

Dioecia. Diandria.

* Leaves entire or obscurely screate:

1. S. viminalis Linn.: leaves linear-lanceolate, very long, acuminate, nearly entire, somewhat undulate, white silky beneath; stipules very small, sublanceolate; branches virgate; aments appearing before the leaves; scales roundish, very hairy; germs sessile, ovate; style filiform; stigmas acute, undivided.

Hab. Banks of streams. N. S. April, May. 5.—A middle sized tree. Branches slender and flexile. Filaments yellow.

Anthers orange. Introduced. Osier. Basket Willow.

2. S. candida Willd: leaves linear-lanceolate, very long, obscurely toothed at the point, pubescent above, white-tomentose beneath, with the margin revolute; stipules lanceolate, as long as the petioles; aments appearing before the leaves, cylindric; seales obovate-lanceolate, very long, villous.

Hab. Shady woods. N. Y. and Penn. N. to Arc. Amer. April, May. 5.

3. S. muhlenbergiana Willd.: leaves lanceolate, nearly acute, entire, pubescent-hoary, rugosely-veined beneath, with the margin revolute; stipules deciduous, lanceolate; aments appearing before the leaves, diandrous; scales oblong, the margins villous; germs ovate-lanceolate, clothed with silken hairs, on long pedicels; style short; stigmas bifid.—S. alpina Walt.

Har. Dry woods. N. Y. to Car. April. 5.—A shrub 2—5 feet high, often decumbent; branches pubescent, greenish-yellow, with black dots. Scales white, with a red tip. Anthers purple and yellow.

Dwarf or Speckled Willow.

4. S. tristis Muhl.: leaves linear lanceolate, acute at each end, entire, with the margins revolute, smoothish above, rugosely veined and tomentose beneath; stipules none; aments appearing before the leaves.

HAE. Sandy woods. N. J. to Car. March, April. b. A shrub resembling the preceding, but differing in the form of the leaves and in the absence of stipules.

5. S. recurvata Pursh: leaves obovate-lanceolate, acute, very entire, with the margin glandular, smooth, glaucous beneath, silky when young; stipules none; aments appearing before the leaves, recurved: scales black at the point, with long hairs; germs ovate, on short pedieels, silky; style very short; stigmas bifid.

- Нав. Shady woods. N: J. and Penn. April. b.—A low shrub, with brown smooth branches and yellow buds.
- 6. S. pedicillaris Pursh: branches smooth; leaves obovate-lanceolate, acute, very entire, smooth and of the same colour on both sides; stipules none; aments pedunculate, very smooth; scales oblong, half the length of the pedicel, scarcely hairy; germs ovate-oblong, on a very long pedicel; stigmas sessile, bifid.

HAB. Catskill mountains, N. Y. April. b. Pursh.

- 7. S. rosmarinifolia Linn.: leaves straight, linear-lanceolate, acute at cach end, very entire, pubescent above, silky beneath; stipules lanceolate, erect; aments appearing before the leaves; scales oblong, obtuse, ciliate; germs pedicellate, lanceolate, villous; stigmas subsessile, bifid.
 - HAR. Wet meadows and mountain swamps. Penn. to Car. March.
 D.—A shrub 1—3 feet high; the branches silky pubescent.
 Leaves 1 1-2 inches long, becoming smooth when old.
 —According to Sprengel, the Linnaan S. rosmarinifolia is identical with S. depressa of Hoffmann.
- 8. S. repens Linn.: creeping; leaves elliptic-lanceolate, very entire, acute, smooth, somewhat silky beneath; stipules none; aments appearing before the leaves, ovate; diandrous; scales obovate, obtuse, hairy, fuscous at the point; germs ovate-oblong, on pedicels, pubescent; style very short; sigmas 2-lobed; capsule smooth.—S. depressa Hoff.

HAB. Can. and N. Y. ? May. b. -A very small creeping spe-

cies.

** Leave's remotely and obtusely serrate.

9. S. conifera Wangh.: leaves oblong-lanceolate, flat, remotely scrate, acute, smooth above, tomentose beneath; stipules lunate, subdentate; aments appearing before the leaves, diandrous; scales lanceolate, obtase, villous; germs on pedicels, lanceolate, silky; style bifid; stigmas 2-lobed.—S. longirostris Mich.

HAB. Shady woods. N. Y. to Car. April. 5.—Shrub 4—8 feet high, with cone-like excrescences at the end of the branches. Style long.

10. S. myricoides Muhl.: leaves oblong-lanceolate, acute, biglandular at base, obtusely serrate, smooth, glaucous beneath; stipules ovate, acute, glandular-serrate; aments villous, leafy at the base; scales lanceolate, obtuse, villous, black; germs on long pedicels, lanceolate, glabrous; style bifid; stigmas bifid.

Hab. Woods and meadows. N. Eng. to Vir. April. 5.—A small shrub. Branches green; younger ones purple, smooth.

11. S. prinoides Pursh: leaves oval-oblong, acute, remotely undulate-serrate, glabrous, glaucous beneath; stipules semicordate, incisely toothed; aments appearing before the leaves, villous; germs pedicellate, ovate, acuminate, silky; style long; stigmas bifid.

HAB. On the banks of rivers. Penn. to Vir. March, April. 5.—A shrub 6-8 feet high.

12. S. discolor Willd.: leaves oblong, somewhat obtuse, smooth, remotely serrate, very entire at the point, glaucous beneath; stipules deciduous, lanceolate, serrate; aments appearing with the leaves, diandrous, oblong, tomentose; scales oblong, acute, hairy, black; germs subsessile, lanceolate, tomentose; style of middling length; stigmas 2-parted.

Hab. Low grounds. N. Eng. to Car. April. 5.—A shrub or small tree, dark brown. Filaments white; anthers red, yellow when burst.—Perhaps identical with the preceding.

Bog Willow.

- 13. S. angustata Pursh: leaves lanceolate, acute, very long, gradually attenuated at the base, serrulate, very smooth, nearly of the same colour; stipules semicordate; aments appearing before the leaves, erect, somewhat glabrous; germs pedicellate, ovate, smooth; style bifid; stigmas 2-lobed.
 - Hab. Banks of streams.
 N. Y. and Penn. W. to Miss. March,
 April.
 April.
 According to Mr. Nuttall it is identical with the next.
- 14. S. longifolia Muhl.: leaves linear, acuminate at each end, elongated, remotely toothed, smooth, nearly of the same colour on both sides; stipules lanceolate, toothed; aments peduncled, tomentose, diandrous; scales flat, refuse; filaments bearded at base, twice the length of the scales.
 - HAR. On the banks of the Susquehannah. Penn. W. to Miss.

 Muhl. July. 2.—A shrub about 2 feet high, with brown branches and white branchlets.

*** 'Leaves closely and acutely serrate.

15. S. babylonica Linn.: branches pendulous; leaves lanceolate, acuminate, serrate, smooth, somewhat glaucous beneath; stipules roundish-acuminate, serrate; aments appearing with the leaves; germs sessile, ovate, smooth.

Hab. Road sides, near cultivated ground. May. b.—A tree which is introduced from Europe, but has been so much planted for ornament as to have become almost naturalized.

Weeping Willow.

- 16. S. purshiana Spreng.: leaves very long, linear-lanceolate, gradually attenuate above; subfalcate at base, acute, approximateserrate, smooth on both sides, silky when young; stipules lunate, toothed, reflexed.—S. falcata Pursh.—S. cordata var. falcata Torr.?
 - Hab. Banks of streams. Penn. to Vir. Pursh. Penn. Darlington. 5.—A small tree, 8.—15 feet high, with smooth and slender branches.—Humboldt having given the name of falcata to a South American species of Salix; Sprengel proposes to change the name of Pursh's plant. Spreng. Syst. v. 608.
 - 17. S. nigra Marsh.: leaves lanceolate, acute at each end, serrulate,

smooth on both sides; petiole and midrib tomentose above; stipules toothed; aments appearing with the leaves, erect, cylindric, villous; scales oblong, very villous; filaments 3—6, bearded at base; germs pedicelled, ovate, smooth; style very short; stigmas bifid.—S. caroliniana Mich.—S. pentandra Walt.

HAB. Banks of streams. Penn to Car. April, May. 5.—A tree from 15—20 feet high, generally branching from the base; pranches very brittle at base. Sterile aments 3 inches long., Fil-

aments generally 5.

18. S. lucida Muhl.: lcaves ovate-oblong, cuspidate-acuminate, rounded at base, serrate, smooth and shining on both sides; stipules oblong, serrate; aments appearing with the leaves, triandrous; scales lanceolate, obtuse at base, pilose, serrate at the point, smooth; germs lanceolate-subulate, smooth; style bifid; stigmas obtuse.

IIAB. Low grounds. N. Y. to Vir. May. 5,—A shrub or small tree with yellowish-brown branches. Leaves thick.

- 19. S. rigida Mahl.: leaves oblong-lanceolate, acuminate, subcordate at base, rigid, smooth, coarsely serrate, the lowest serratures elongated; petioles villous; stipules large, cordate, obtuse, serrate; aments appearing with the leaves, triandrous; scales lanceolate, woolly, black; germs on long pedicels, lanceolate, smooth; style very short; stigmas 2-parted.—S. cordata Mich.
 - HAB. Swamps. N. Eng. to Vir. April, May. b. A small tree; branches green, red towards the end, the younger ones pubescent.—It is tough and much used by basket makers.
- 20. S. cordata Muhl.: leaves oblong-lanceolate, acuminate, cordate at base, acutely serrate, smooth, paler beneath; stipules large, ovateroundish, serrate; aments appearing with the leaves, triandrous; scales lanceolate woolly, black; germs on pedicels, lanceolate, smooth; style very short; stigmas bifid.

HAn. Low swampy ground. N.Y. to Vir. N. to Arc. Amer. April, May. 5.—A slirub 6—8 feet high, with large and broad leaves.

21 S. grisea Willd.: leaves lanceolate, acuminate, serrulate, smooth above, silky or naked beneath; stipules linear, deflexed, deciduous; aments appearing before the leaves; scales oblong, hairy, black at the point; gcrms oblong, pedicelled, silky; stigmas sessile, obtuse.—S. sericea Muhl.

HAB. Low grounds. Penn. to Vir. April. 19.—A shrub 3—8 feet high; branches greenfsh-purple, very brittle at the base.

22. S petiolaris Smith: leaves lanceolate, scrrate, smooth, glaucous beneath, silky at base, mostly unequal; stipules lunate, toothed; aments appearing before the leaves, loose; scales obovate, obtuse, hairy, black; germs on long pedicels, ovate, silky, stigmas sessile, 2-lobed.

HAB. Swamps and banks of streams; common. Pursh. April. - Λ small tree with slender smooth dark brown branches.

23. S. alba Linn.: leaves lanceolate, acuminate, serrate, silky on both sides; lower serratures glandular; stipules obsolete; aments appearing with the leaves, elongated; scales elliptic-lanceolate, of the same colour, pubescent; germs subsessile, ovate-oblong; style short; stigmas 2-parted, thick.

HAB. Road sides and river banks. April, May. b .- A tall tree,

introduced from Europe. Pursh.

- 24. S. vitellina Linn: leaves lanceolate, acuminate, with thickened serratures, smooth above, paler and somewhat silky beneath; stipules none; aments appearing with the leaves, cylindric; scales ovate-lanceolate, externally pubescent; germs sessile, ovate lanceolate, smooth; stigmas subsessile, 2-lobed.
 - Hab. Road sides and about farms. May. 5.—A middle-sized tree, introduced from Europe.
- 25. S. decipiens Hoff.: leaves lanceolate, acuminate, serrate, very smooth, same colour on both sides; petioles glandular toothed; stipules roundish; aments appearing with the leaves; scales obovate, villous; germs subsessile, lanceolate, smooth; stigmas sessile, 2-parted.—S. fragilis Linn.—S. russeliana Smith.
 - HAE. Road sides, &c. Introduced into the N. S.? Native in Arc. Amer. Richardson. April, May. . —A small tree with very brittle branches.
- 26. S. ambigua Pursh: leaves lanceolate, acuminate, same colour on both sides, smooth, glandular, serrate; aments appearing with the leaves; nectary large; its lobes lanceolate, smooth, toothed at the summit; terminal flowers triandrous
 - HAR. Low grounds. N. Y. and N. J. April. D.—The only authority for this as an American species, I believe, is Pursh, who says it resembles in leaves and habit S. ritellina, and in fructification S. decipiens. Sprengel considers it a variety of S. triandra of Linnæus.

2. POPULUS. Linn.

Dioecious. Ament cylindrical; scales lacerated. Sterile Fl. Anthers 8—30, arising from a turbinate, oblique, entire, single perianth. Fertile Fl. Perianth turbinate, entire. Stigmas 4. Capsule superior, 2-celled, 2-valved, many-seeded. Seeds comose. Dioecia. Octavdria.

1. P. balsamifera Linn.: leaves ovate, acuminate, appressed-scrrate, white and reticular-veined beneath; buds resinous.

HAE. Can. and N. to the Arctic Sea; abundant. Introduced into N. Y. March. 5.—A tree from 70—80 feet high, the young buds of which are covered with an odoriferous balsam.

Balsam Poplar. Tacamahac.

2. P. candicans Ait.: leaves cordate, ovate, acuminate, obtusely and unequally scrrate, white beneath, somewhat 3-nerved, reticular-vein-

ed; petioles hairy; buds resinous; branches terete.—P. canadensis and latifolia Moench.

HAR. Woods. N. Eng. Pursh. March. 5.—A tree from 40—50 feet high; leaves large; buds covered with balsam.

Balm of Gilcad.

3. P. tremuloides Mich.: leaves roundish, abruptly acuminate, dentate-serrate, pubescent on the margin.—P. trepida Willd.?

HAB. Woods. N. S. N. to Subare. Amer. April. 5.—A tree from 20—30 feet high, with smooth bark. Leaves small, light, roundish. Flowers in pendulous silken aments.

- 4 P. monilifera Ait.: leaves subcordate-deltoid, smooth, glandular at base, serrate; serratures cartilaginous, hamate, somewhat hairy; nerves spreading; petioles compressed above; older branches terete.—P. glandulosa and P. caroliniensis Mocneh.
 - HAB. Banks of the Hudson, near Troy, N.Y.; apparently native. April. 5.—A tree 70—80 feet high. Fertile aments very long.—Michaux remarks that this tree has not been met with in N. America growing wild, but it has been generally considered a native of this country.

 Virginian Poplar
- 5. P. hudsonica Mich.: leaves rhomboid, with a very long acumination, dentate-serrate, smooth; young branches hairy.—P. betalifolia Pursh.
 - Hab. Banks of streams. N. S. March. 5.—A tree 30—40 feet high, with spreading branches, which are covered with a grayish-white bark when young.

 American Black Poplar.
- 6. P. grandidentata Mich.: leaves ovate, nearly round, acute, unequally and sinuately toothed, smooth, the younger ones villous; petioles compressed near the summit.

b. pendula Nutt.: branches pendulous.

- Hab. Can. and N. S. April. 5.—A tree from 40 to 50 feet high, covered with a smooth greenish bark. Young leaves covered with a thick down, which disappears as they become older. The large and unequal indentations on the margins of the leaves sufficiently characterises this species.—Var b. is found on the Alleghany mountains, Penn.

 American Large Aspen.
- 7. P. lævigata Ait.: leaves roundish-ovate, deltoid, acuminate, sub-cordate, unequally serrate, smooth, glandular at base; petioles compressed; younger branches angled.—P. canadensis Mich.
 - Hab. Rocky grounds. Can. to Vir. W. to the Rocky Mountains. March. 5.—A tree from 70 to 80 feet high; branches angular, the angles forming whitish lines. Leaves large, deltoid, somewhat cordate; petioles with two glands at the base.—This species has been confounded with P. angulata, but according to the younger Michaux it is distinct.
- 8. P. heterophylla Linn: leaves roundish-ovate, obtuse, uncinately toothed; the sinus small, cordate and somewhat aurieled; when young tomentose.
 - HAB. Swamps. N. Y. to Car. and W. to Miss. May. b.

A tree 60-80 feet high, with the branches not angled. Leaves with lobes or auricles that often conceal the insertion of the petiole.

SUBORDER II. MYRICEÆ.

3. MYRICA. Linn.

Dioccious. Ament ovate-oblong; scales lunulate. Sterile Fl. Stamens 4—6. Anthers 4-valved. Fertile Fl. Ovary 1. Stigmas 2. Drupe 1-celled, 1-seeded.

Dioccia. Tetrandria.

1. M. gale Linn.: leaves cuneate-lanceolate, serrate at the apex, obtuse; sterile aments imbricated; scales acuminate, ciliate; fruit in scaly heads.

HAB. Bogs and mountain lakes. Can. and N. S. May. F.— A branching shrub 4—5 feet high. Leaves alternate. Fruit with a strong penetrating spicy scent.

Sweet Gale. Dutch Myrtle.

2. M. cerifera Linn.: leaves cuneate-lanceolate, with a few serratures near the summit, acute; sterile aments loose; scales acute; fruit globular, naked.—M. caroliniensis and pennsylvanica Pursh.?

Hab. Shady woods. N. Eng. to Flor. May, June. 5.—A shrub 2—8 feet high, but sometimes (especially at the South,) 10—18 feet, diffusely spreading. Leaves varying in width, sometimes entire, somewhat pubescent. Fruit small, dry and juceless, but by boiling, a wax of very pleasant flavour is extracted from it, which is used for making candles, &c. Big. Med. Bot. iii.

Bayberry. Wax Myrtle.

4. COMPTONIA. Gaert.

Monoecious. Sterile Fl. Ament cylindrical; scales 1-flowered. Perianth 2-parted: Stamens 3, forked; anthers 6. Fertile Fl. Ament globose; scales 1-flowered. Styles 2. Nut ovate. Monoecia. Triandria.

C. asplenifolia Ait.—Liquidambar asplenifolium Liun.

HAB. Woods. Can. to Geor. April, May. 9.—A shrub 2—4 feet high. Leaves long, linear, cut almost to the midrib into numerous roundish lobes. Flowers in oval sessile aments—The whole plant when rubbed, has a strong and somewhat fragrant scent. Nuts forming a round burr. Succet Fern.

SUBORDER III. BETULINEÆ.

5. BETULA. Linn.

Monoecious. Ament cylindrical. STERILE FL. Perianth none. Stamens 10-12. FERTILE FL. Scales imperfectly

3-lobed, 3-flowered. Perianth none. Styles 2. Nuts compressed, with a membranaceous margin, 1-seeded.

Monoecia. Polyandria.

- 1. B. populifolia Ait.: leaves deltoid, long-acuminate, unequally serrate, very smooth; petioles smooth; scales of the strobile with roundish lateral lobes.
 - Hab. Rocky woods. Can. and N. S. May. 7.—A tree from 30—40 feet high, with white bark which is easily separable into thin layers. Leaves tapering to a long point. Flowers in long pendulous aments.

 White Birch.
- 2. B. excelsa Ait.: leaves ovate, acute, serrate; petioles pubescent, shorter than the peduncles; scales of the strobile with rounded lateral lobes.—B. lutea Mich.f.
 - IIAB. Low grounds. N. Eng. and N. Y. May, June. 5.
 —Λ tree from 70—80 feet high, with a yellowish bark, which is slightly fragrant. Fertile aments ovate, erect.—Used for fuel.
 Yellow Birch.
- 3. B. nigra Linn.: leaves rhombic-ovate, doubly serrate, acute, pubescent beneath, entire at base; fertile ament ovate; scales villous, with the segments linear and equal.—B. rubra Mich. f.

HAB. Banks of streams. N. J. to Car. May. 5.—A middle-sized tree, though sometimes quite large. Leaves on short petioles and acutely serrate.—The wood is of little consequence.

Red Birch

- 4. B. papyracea Ait.: leaves ovate, acuminate, doubly serrate; veins beneath hirsute; petioles smooth; fertile aments pedunculate, nodding; scales with short suborbicular lateral lobes.—B. papyrifera Mich.
 - Hab. Can. and N. Y. N. to Hudson's Bay. May, June. 5.

 —A large tree, the bark of which is used by the Indians for constructing their canoes:

 Canoe Birch.
- 5. B. lenta Linn.: leaves cordate-ovate, sharply serrate, acuminate; nerves beneath and petioles hairy; scales of the ament smooth; lobes obtuse, equal, with elevated veins.—B. carpinifolia Mich.
 - HAB. Woods. Can. to Geor. May, June. A large tree, with the branches spotted with white when young. Its bark is fragrant and aromatic. Leaves cordate at base and terminating in a long point.—The wood of this species has a fine grain, and is susceptible of polish.

 Black Birch. Mahogany Birch.
- 6. B. pumila Linn.: young branches pubescent, without dots; leaves orbicular-obovate; petioles densely pubescent beneath; fertile ament cylindrical.
 - Hab. Mountain bogs. Can., N. Y. and Penn. May, June. 5.
 A shrub 2-3 feet high, with the leaves on short petioles.
- 7. B. glandulosa Mich.: branches glandular, punctate, smooth; leaves obovate, serrate, very entire at base, smooth, subsessile; fertile ament oblong; scales half 3-cleft; seeds orbicular, with a narrow margin.

Hab. Mountains. Can. and N. S. W. to N. W. Terr. May. p.—A shrub about 2 feet high.

8. B. nana Linn.: very smooth; leaves orbicular, crenate, reticular-veined beneath; scales of the ament deeply 3-parted; segments oblong; seeds orbicular, nearly wingless.

HAB. White Mountains, N. H. N. to Hudson's Bay. April,

May. b.-A shrub 1 or 2 feet high, with small leaves.

6. ALNUS. Willd.

Monoecious. Sterile Fl. Ament long, cylindrical; scales 3-lobed, 3-flowered. Perianth 4-parted. Stamens 4. Fertile Fl. Ament ovate; scales subtrifid, 2-flowered. Perianth none. Styles 2. Nut compressed.

Monoecia. Tetrandria.

1. A. serrulata Willd.: leaves obovate, acuminate, veins and axils of the veins hairy beneath; stipules elliptic, obtuse.

HAB. Swamps and banks of rivers. Can. to Car. March. 5.
 —A shrub 6—10 feet high, with alternate leaves. Sterile flowers in a long pendulous ament; flertile ones short and rigid, forming a persistent cone.

2. A. undulata Willd.: leaves ovate-oblong, acute, unequally serrate, undulate; petioles and veins beneath hairy; stipules ovate-oblong.—
A. crispa Pursh.—Behela crispa Mich.

HAB. Can. and mountains in N. S. April. b.—A shrub 3—4 feet high.

7. CARPINUS. Linn.

Monoecious. Sterile Fl. Ament long-cylindric; scales ciliate at base. Stamens 8—14, somewhat bearded at the top. Fertile Fl. Strobile lax; scales leafy, 2-flowered. Stigmas 2. Nut bony, ovate, suicate, 1 seeded.

Monoecia. Polyandria.

C. americana Willd.: leaves oblong-ovate, acuminate, unequally serrate; scales of the strobile 3-parted, the middle segment oblique, ovatelanceolate, toothed on one side.—C. virginiana Mich.f.

Hab. Woods. Can. to Flor. May. 5.—A small tree, with the leaves alternate on short petioles and sharply serrate. Fertile aments loose, with large foliaceous scales. Hornbeam.

8. OSTRYA. Mich.

Monoecious. Sterile Fl. Ament cylindrical; scales I-flowered. Perianth none. Filaments branched. Fertile Fl. Ament naked. Capsule inflated, imbricate, 1-seeded at base.

Monoecia. Polyandria.

O. virginica Willd.: leaves ovate-oblong, cordate at the base, acuminate, unequally serrate; strobile oblong-ovate, erect; buds acute.

- Carpinus Ostrya Mich. ?

HAB. Woods. Can. to Car. May. 5.—A small tree with exceedingly hard and heavy wood. Leaves alternate, ovate. Fertile flowers enlarged into a sort of oblong cone resembling the common hop.

Hop Hornbeam.

SUBORDER. IV. PLATANEÆ.

9. PLATANUS. Linn.

Monoecious. Ament globose. Sterile Fl. Stamens numerous, intermixed with linear scales. Fertile Fl. Scales spathulate. Styles with a recurved stigma. Seeds roundish, clavate, pappose at base. Monoecia. Polyandria.

P. occidentalis Linn.: leaves 5-angled, obscurely lobed, toothed, pu-

beseent beneath; branches nearly white.

HAE. Banks of streams. Can. to Flor. and W. to Miss. May. 5.—One of the largest trees in North America, attaining in favorable situations an enormous size. Leaves alternate, on long petioles. Aments axillary, on long peduncles, globular. Button Wood. Sycamore.

10. LIQUIDAMBAR. Linn.

Monoecious. Sterile Fl. Ament conical, surrounded by a 4-leaved involucre. Perianth none. Stamens numerrous. Fertile Fl. Ament globose, Perianth 1-leaved, urceolate, 2-flowered. Styles 2. Capsules 2, surrounded at base by the perianth, 1-celled, many-seeded.

Monoecia. Polyandria.

L. styraciflua Linn.: leaves palmately lobed; lobes acuminate, serrate, with the sinuses at the base of veins villous.

Hab. Low woods. N. Y. to Flor. and W. to Miss. May. b.—A tree sometimes attaining very large dimensions. Leaves when bruised, fragrant, and exuding a gum which is pleasant and slightly aromatic.

Sweet Gum Tree.

SUBORDER V. CUPULIFERÆ.

11. QUERCUS. Linn.

Monoecious. Sterile Fl. Ament loose, Perianth single, mostly 5-cleft. Stamens 5—10. Fertile Fl. Cupule cup-shaped, scaly. Perianth 6-lobed. Ovary 3-celled, 2 of them abortive. Style 1. Stigmas 3. Acorn 1-celled, 1-seeded, surrounded at base by the enlarged scaly cupule.

Monoecia. Polyandria.

* Fruetification biennial. Leaves setaceously mucronate.

† Leares entire.

1. Q. phellos Linn.: leaves deciduous, linear-lanccolate, tapering at each end, very entire, smooth, mucronate; acom nearly round.

HAB. Low swampy forests. N. J. to Flor. May. 5.—A tree from 30 to 60 feet high, generally straight and slender. Leaves when young of a light green colour and dentate. Acorn small, nearly round.—The timber is of little use.

Willow Oak.

2. Q. imbricaria Mich.: leaves deciduous, oblong, acute at each end. mucronate, very entire, shining, pubescent beneath; cup shallow; scales broad ovate; acorn subglobose.

HAB. Banks of rivers in mountaneous regions. Penn. to Car. W. to Miss. June. 5.—A tree 40—50 feet high, with numerous irregular branches. Acorn small, nearly spherical, in a flat nearly sessile cup.—The wood splits easily and is used in the Western States for shingles.

Shingle Oak.

†† Leaves dentate or with short lobes.

3. Q. heterophylla Mich.: leaves on long petioles, ovate-lanceolate or oblong, entire or coarsely toothed; cup hemispherical; acorn subglobose.

Hab. Banks of the Delaware. Penn. May. D.—According to Pursh, there is only one individual of this species known, which grows near Philadelphia. He suggests that it may be a hybrid. It is figured and described by Michaux in his Sylva Americana.

4. Q. aquatica Walt.: leaves obovate-wedge-form, smooth, very entire, obscurely 3-lobed at the end, with the middle lobe largest; cup hemispherical; acorn subglobose.—Q. nigra Linn.

HAB. Swamps. Md. to Flor. May. 5.—A tree 30—40 feet high. Leaves very variable. Cup shallow. Acorn rather small, roundish. Resembles Q. lawifolia.—Its timber is of no value.

Water Oak.

5. Q. triloba Linn.: leaves oblong-wedge-form, acute at the base, somewhat 3-lobed at the end; lobes equal, mucronate, tomentose beneath, middle one longer; cup flat; acorn depressed-globose.

Hab. Pine barrens. N. J. to Geor. May. 5.—A tree 20—40 feet high, of rapid growth. Downy Black Oak.

6. Q. nigra Willd.: leaves coriaceous, wedgeform, subcordate at base, dilated and retusely 3-lobed at the summit; when young mucronate, smooth above, rusty and pulverulent beneath; cup turbinate, with scales obtuse and scarious; acorn short, ovate.—Q. ferruginea Mich.f.

HAB. Sandy woods. N. J. to Flor. May. 5.—A tree 20—30 feet high, irregular in its growth, and covered with a thick rough black bark.—The wood is much esteemed for fuel.

Barren Oak. Black Jack.

7. Q. tinetoria Bartram: leaves obovate-oblong, slightly sinuate, pubescent beneath; lobes oblong, obtuse, obscurely toothed, mucronate; cup flat; acorn depressed-globose.

- 11AB. Woods. Can. to Geor. W. to Miss. May. 5.—One of the largest species of oak, sometimes attaining the height of 70 or 80 fect, covered with a dark coloured bark, from whence it has derived its common name. It is highly valued on account of its timber, as well as its bark.

 Black Oak. Quereitron.
- 8. Q. discolor Ait.: lcaves oblong, pinnatifid-sinuate, pubescent beneath; lobes oblong, toothed, setaceously mucronate; cup turbinate; acorn ovate.—Q. tinctoria sinuosa Mich. f.
 - Hab. Forests. Penn. to Car. May. 5.—A large tree, resembling the preceding, and also Q. coccinea, but differs in having the young leaves covered with down.—It is still, however, doubtful whether it is really distinct.

††† Leaves deeply sinuate and lobed.

9. Q. coceinea Wangh.: leaves on long petioles, oblong, deeply sinuate, smooth; lobes divaricate, dentate, acute, setaceously-mucronate; cup turbinate, scaly; acorn short, ovate.

IIAB. Fertile woods. N. Eng. to Geor. May. b.—A tree 70-80 feet high. Distinguished by the brilliant red colour of its leaves towards the close of autumn.—Its wood is used for staves and fuel.
Scarlet Oak.

10. Q. rubra Linn.: leaves on long petioles, oblong, smooth, obtusely sinuate; lobes rather acute, toothed, setaceously mucronate; cup flat, nearly smooth; acom subovate.

Har. Forests. Can. to Geor. May. 5.—A tree from 70—80 feet high. Leaves bright green; sinuses large, rounded.—Resembles the former, but its leaves are large, and in autumn they change to a dull red and finally become yellow. The acorn also is larger, has a flat base and shallow cup.—It is valuable both for its wood and bark.

Red Oak.

11. Q. catesbai Mich.: leaves on short petioles, wedgeform at base, oblong, deeply sinuate, smooth; lobes 3—5, divaricate, dentate, acute, setaceously mucronate; cup turbinate, broad; scales obtuse, those of the margin bent inwards; acorn subglobose.

Hab. Pine barrens. Md. to Flor. May. 5.—A shrub or small tree, from 10—20 feet high, with an irregular stem and branches. Leaves coriaceous and glossy. Cup large and remarkable for its obtuse scales.—The wood makes excellent fuel, and its bark is used by the tanner.

Barren Serub Oak.

12. Q. falcata Mich.: leaves on long petioles, obtuse at base, tomentose bencath, 3-lobed or sinuate; lobes somewhat falcate, setaceously mucronate, the terminal one long; cup shallow, somewhat turbinate; acorn globose.—Q. elongata Linn.—Q. rubra Walt.

HAB. Sandy soil. N. J. to Geor. May. 5.—A tree 70—80 feet high. Leaves with 3—5 lobes, glossy on the upper surface.

—The wood is used for staves, fencing and fuel. The bark is highly esteemed by tanners. Spanish Oak. Red Oak.

13. Q. palustris Mich.: leaves on long petioles, oblong, deeply sinute, smooth; axils of the veins villous beneath; lobes divaricate, den-

tate, acute, setaceously mucronate; cup flat, smooth; acorn subglo-

- Hab. Swampy woods. N. Y. N. Eng. and Penn. W. to Ill. May. 5.—A tree 40-60 feet high, with small handsomely divided leaves. Acorns small, abundant .- The wood is firm and Water Oak. Pin Oak. much used by mechanics.
- 14. Q. bannisteri Mich.: leaves on long petioles, obovate-wedgeform, 3-5-lobed, entire on the margin, grayish tomentose beneath; lobes setaceously mucronate; cup subturbinate; acorn subglobose. - Q. illicifolia Willd.
 - HAB. Dry hills and barrens. Can. to Geor. May. b.-A shrub 4-6 feet high. Fruit abundant -- Covers large tracts called oak barrens, in various parts of New-York and other Shrub or Scrub Oak. states.
 - ** Fructification annual. Fruit pedunculate. Leaves aunless.

† Leaves lobed.

15. Q. obtusiloba Mich.: leaves oblong, sinuate, wedgeform at base. pubescent beneath; lobes obtuse, the upper one dilated and 2-lobed; cup hemispherical; acorn oval. -Q. stellata Linn.

HAB. Sterile grounds. Can. to Ffor. May. 5.—A tree 30—50 feet high, with straggling irregular branches. Leaves mostly 5-lobed. Cup hemispherical, enclosing nearly half of the acorn. -The timber is much esteemed in ship building, and is supposed in durability and strength to surpass that of any other species of oak except the live oak.

16. Q. macrocarpa Linn.: leaves tomentose beneath, deeply and lyrately sinuate-lobed; lobes obtuse, repand, upper ones dilated; cup deep, with the upper scales setose; acorn ovate, turgid.

HAB. Limestone hills. Penn. and throughout the Western and South Western States. May. 5 .- A large tree with the fruit larger than in any other American species .- The wood is of Overcup White Oak. excellent quality.

17. Q. olivaformis Mich.: leaves oblong, smooth, glaucous beneath. deeply and unequally sinuate-pinnatifid; cup very deep, crenate above; acorn elliptic-oval.

HAB. Hills. N. Y. to Vir. May. b .- A tree somewhat resembling the preceding .- Michaux credits it to the banks of the Hudson near Albany, but I have never met with it in this vicinity.

18. Q. alba Linn.: leaves oblong, pinnatifid-sinuate, pubescent beneath; lobes linear-lanceolate, obtuse, very entire, attenuate at base;

fruit pedunculate; cup deep, tuberculate; acorn ovate.

HAB. Fertile forests. Throughout the U.S. May. b.-One of the largest and most valuable of the American forest trees, often 80-100 feet high, and 3-7 in diameter. Bark white. Leaves pubescent beneath when young.—Timber firm and durable, and of great use in ship building and in many other arts.

White Oak.

†† Leaves entire, dentate.

- 19. Q. prinus Linn.: leaves on long petioles, obovate, acute, pubescent beneath, coarsely toothed; teeth unequal, dilated, callous at the point; cup deep, attenuate at base; acorn ovate.—Q. prinus palustris Mich.
 - IIAB. Shady woods. N. Y. to Flor. May. 5.—A large tree. Leaves large, on petioles about an inch long. Cup hemispherical, enclosing about one third of the acorn, on short peduncles. Acorn large.—Timber inferior to that of the preceding, but often employed indiscriminately with it.

 Swamp Chesnut Oak.
- 20. Q. bicolor Willd.: leaves on short petiolcs, oblong-obovate, whitish tomentose beneath, coarsely toothed, very entire at the base; teeth unequal, dilated, rather acute, callous at the summit; fruit in pairs, on long peduncles; cup hemispherical; acorn oblong-ovate.—Q. prinus discolor Mich. f..
 - HAB. Low woods and swamps. N. Y. to Car. May. 5.—A large tree, with the bark separating into large flat scales or plates. Leaves variable. Acorn large, in a small cup.—Its timber is in less repute than that of many other species. Swamp White Oak.
- 21. Q. montana Willd.: leaves on petioles, broad-obovate, oblong, white tomentose beneath, shining above, coarsely toothed, obtuse and unequal at the base; teeth nearly equal, very obtuse; fruit in pairs, on short peduncles; cup hemispherical; scales tuberculate, rugose; acorn ovate.—Q. prinus monticola Mich.
 - HAB. In rocky situations. N. Y. to Car. May. b.—A tree of less size than the two preceding.—Its wood resembles the white oak in strength, and its bark is highly esteemed by tanners. For fuel it is scarcely exceeded in value by any of our trees.

Rock Chesnut Oak.

- 22. Q. castanea Muhl.: leaves on long petioles, oblong-lanceolate, obtuse at base, acuminate, tomentose beneath, coarsely toothed; teeth unequal, dilated, acute, callous at the point; cup hemispherical; acorn oyate, subglobose.—Q. prinus acuminata Mich.
 - HAB. Mountains. N. Y. to Geor. May. \(\frac{5}{2}. \)—A tree 60—70 feet high. Leaves on long petioles and narrower than those of the former. Fruit middle-sized, on short peduncles.—In name and use it is often confounded with \(Q. \) prinus. Yellow Oak.
- 23. Q. chinquapin Mich.: leaves on short petioles, obovate, acute at the base, coarsely toothed, glaucous beneath; teeth nearly equal, dilated, callous at the point; cup hemispherical; acorn ovate.—Q. prinoides Willd.
 - HAB. Barrens. N. Y. to Geor. May. 5.—A shrub from 3-4 feet high. Acorns small, numerous.—It occurs in tracts or patches intermingled with Q. bannisteri.

Chinquapin. Dwarf Chesnut Oak.

12. CASTANEA. Tourn.

Monoecious. Sterile Fl. Ament very long, cylindrical.

Perianth single, of 1-lenf, 6-lobed. Stamens 5—20. Fertile Fl. 3, within a 5-lobed thickly muricated involucre or cupule. Perianth 5—6-lobed, having the rudiments of 12 stamens. Styles 6. Nut 1—2-seeded, invested with the enlarged involucre. Monoecia. Polyandria.

1. C. vesca Willd.: leaves lanceolate, acuminate, mucronately-serrate, smooth on both surfaces.—Fagus eastanea Linn. Walt.

HAB. Dry woods. N. Y. to Car. W. to Ill. May, June. b.

—A large tree, and one of the most useful. Leures 6 inches long, pubescent beneath when young. Spikes of sterile flowers as long as the leaves, yellowish. Nuts generally 3.—The American species appears to be identical with the European, although by some botanists it is considered distinct. The wood is extremely durable and is highly esteemed for posts and rails to construct fences.

Chesnut Tree.

2. C. pumila Willd.: leaves oblong, acute, mucronate-serrate, white tomentose beneath.

Hab. Sandy fields and woods. N. J. to Geor. May. b.—A shrub or small tree—at the North being seldom more than 10 or 12 feet high. Leaves smaller than in the preceding, oval and obovate. Nut small, ovate, acute, very sweet.—The wood is durable, but too small to be converted to much use. Chinquapin.

13. CORYLUS. Linn.

Monoecious. Sterile Fl. Ament cylindrical; scales 3-cleft. Perianth none. Stamens 8. Anthers 1-celled. Fertile Fl. Perianth obsolete. Ovaries several. Stigmas 2. Nut ovate, surrounded with the enlarged coriaceous and scaly involucre forming the cupule. Monoecia. Polyandria.

1. C. americana Walt.: leaves roundish, cordate, acuminate; involucre roundish-campanulate, larger than the subglobose nut; border dilated, many-cleft.

Hab. Shady woods. Can. to Flor. March, April. 5.—Shrub 4—8 feet high, with virgate branches, pubescent when young. Nuts large, ovate; eatable. Hazel Nut. Wild Filbert.

2. C. rostrata Ait: leaves oblong-ovate, acuminate; stipules linear-fanceolate; involucre tubular-campanulate, longer than the nut, 2-parted, with incised segments.

Hab. Mountains. Can. to Car. May. 5.—Shrub 3—4 feet high. Leaves on short petioles, slightly cordate. Involuere terminating in a tube 1 1-2 inches long. Beaked Hazel.

14. FAGUS. Linn.

Monoecious. Sterile Fl. Ament globose. Perianth 6-cleft. Stamens 5—12. Fertile Fl. 2, within a 4-lobed prickly involucre or cupule. Perianth with 4—5 minute

lobes. Ovaries 3-celled, 2 abortive. Styles 3. Nut 1seeded, invested by the enlarged involucre.

Monoecia. Polyandria.

1. F. sylvatica Linn.: leaves ovate, acuminate, slightly toothed, ciliate on the margin, acute at base; nut ovate, triquetrous, obtuse, but mucronate. - F. sylvestris Mich.

HAB. Woods. N. H. to Geor. May. p.-A large and beautiful tree. Leaves of a bright green.-According to Mr. Nuttall this species is dioecious.

2. F. ferruginea Ait.: leaves ovate-oblong, acuminate, pubescent beneath, coarsely toothed, obtuse and unequally subcordate at base; nut

acutely triquetrous, very acute.

HAB. Woods. Throughout the N. S. May, June. h .- A large tree, with smooth bark. Leaves ribbed. Fruit muricate.-The wood is of a darker colour than the preceding. Both species are highly valuable timber trees, although the wood is not very

ORDER CXII. ULMACEÆ. Mirb.

Flowers monoclinous or polygamous. Perianth divided, campanulate, inferior. Stamens definite, inserted into the base of the calyx; erect in astivation. Ovary superior, 2celled; ovules solitary, pendulous; stigmas 2, distinct. Fruit 1 or 2-celled, indefinite, membranous or drupaceous. Seed solitary, pendulous; albumen none or small in quantity; embryo with foliaceous cotyledons.

Trees or shrubs with scabrous alternate simple deciduous

leaves and stipules.

I. ULMUS. Linn.

Flowers perfect. Perianth campanulate, 4-5-cleft. Stamens 5-8. Styles 2. Fruit compressed, with a broad membranaceous border, (Samara.) Pentandria. Digynia.

- 1. U. americana Linn.: branches smooth; leaves somewhat doubly serrate, unequal at the base; serratures uncinately acuminate; flowers pedicellate; fruit fimbriate.
 - HAB. Low grounds. N. Y. to Car. W. to Miss. April. May. b .- A large tree, with long recurved branches. Flowers purplish, in small fascicles, generally appearing before the leaves. Stamens from 4-8.—In favorable situations the most magnificent tree on the continent.
- 2. U. fulva Mich.: branches scabrous, white; leaves ovate-oblong, much acuminate, pubescent on both sides; buds tomentose, with a thick tawny wool; flowers sessile.

Hab. Mountains. N. Y. to Car. May. b.—Tree of smaller size than the preceding. Leaves much larger, very rough. Stamens 7.—The inner bark contains a large portion of mucilage, and has been employed for medicinal purposes. Slippery Elm.

3. U. nemoralis Ait.: leaves oblong, somewhat glabrous, equally serrate, nearly equal at base; flowers sessile.

HAB. Banks of streams. N. Eng. to Vir.; scarce. April, May. b.—Pursh. River Elm.

4. U. racemosa Thomas: flowers in racemes; pedicels in distinct facicles, united at their bases.

Hab. Western part of N. Y. 5.—A tree with the lower branches having irregular corky excrescences. Leaves ovate, acuminate, auriculate on one side, doubly serrate, smooth above, under side and ribs minutely pubescent. Racenes of several fascicles, 1—2 1-2 inches long. Flowers pedicellate, 2—4 in a fascicle. Calyx 7—8-cleft. Stamens 7—10. Stigmas 2, recurved. Samara ovate, pubescent, margin densely fringed.—Described and figured by David Thomas, Esq., in Silhinan's Journal, xix. 170.

2. CELTIS. Linn.

Perfect or polygamous. Perianth 5-lobed. Stamens 5, subsessile. Styles 2. Drupe globose, 1-seeded.

Pentandria. Digynia.

1. C. occidentalis Linn.: leaves ovate, acuminate, equally serrate, unequal at base, scabrous above, hairy beneath; flowers small, subsolitary.

HAB. Woods. Can. to Car. May. 5.—A middle-sized tree.

Flowers small, greenish-white. Drupe nearly globose, purple.

Hoop Ash. Beaver Wood.

2. C. crassifolia Lam.: leaves ovate, acuminate, unequally serrate, subcoriaceous, scabrous on both sides, unequal at the base; peduncles mostly 2-flowered.

IĬAB. Penn. Mieh. W. to Miss. May. \(\frac{1}{2}\).—Smaller than the former.

3. C. pumila Pursh: leaves broad-ovate, acuminate, equally serrate, unequal at the base, smooth on both sides, the younger ones only pubescent; peduncles mostly 3-flowered; fruit solitary.—C. oeeidentalis var. pumila Muhl.

Hab. Banks of rivers. Md. and Vir. Pursh. May. ▷ —A low shrub. Drupe solitary, brown and glaucous.

in silitable strape solitary, shown and gradeous.

ORDER CXIII. JUGLANDEÆ. De Cand. Lind.

Flowers diclinous. Sterile Fl. in an ament. *Perianth* scaly, oblique, irregularly lobed. *Stamens* inserted on the receptacle, indefinite (3—36); *filaments* short, distinct; an-

thers thick, 2-celled, bursting longitudinally. Fertile Fl. with a single or double perianth, the outer 4-parted, the inner (when present) of 4 pieces. Ovary inferior, 1-celled; ovule solitary, erect; styles 1—2, very short or none; stigmas large, either 2 and lacerated, or discoid and 4-lobed. Fruit drupaceous, 1-celled, with 4 imperfect partitions. Seed 4-lobed; embryo large; albumen none; cotyledons fleshy, 2-lobed, wrinkled; radicle superior.

Trees. Leaves alternate, unequally pinnate.

1. JUGLANS. Linn.

Monoecious. Sterile Fl. Ament imbricate; scales mostly 5-parted. Perianth 5 or 6-parted, Stamens 18—36. Fertile Fl. Perianth double, each 4-parted. Styles 1 or 2. Drupe partly spongy; nut rugose and irregularly furrowed.

Monoecia. Polyandria.

1. J. nigra Linn.: leaves pinnate; leafets numerous, ovate-lanceolate, serrate, subcordate, tapering to the summit; the under surface and petioles slightly pubescent; fruit globose, scabrous, dotted; nut corrugated.

IIAB. Fertile woods. N. Y. to Flor. W. to Miss. April, May. 5.—A tree 50—60 feet high. *Leares* pinnate, with from 15—21 leafets. Sterile *aments* axillary.—Timber compact, fine grained, heavy and dark coloured, when exposed to the air.

Black Walnut.

2. J. cinerea Linn.: leaves pinnate; leafets numerous, lanceolate, serrate, rounded at the base, soft pubescent beneath; petioles villous; fruit oblong-ovate, with a terminal projection, viscid and hairy, on a long peduncle; nut oblong, acuminate, conspicuously sculptured.—J. cathartica Mich.f.

Hab. Woods. Can. to Geor. April, May. b.—A large tree. Leaves pinnate, with 15—17 pubescent leafets.—Habit and fructification very similar to the preceding, but the fruit is oblong, with a protuberant summit, and the nut much more deeply and irregularly sculptured. Medicinal. Big. Med. Bot. i. 115.

Butter-nut. Oil-nut.

2. CARYA. Nutt.

Monoecious. Sterile Fl. Ament imbricated; scales 3-parted. Perianth none. Stamens 4—6. Fertile Fl. Perianth 4-cleft, superior. Style none. Stigma partly discoid, 4-lobed. Pericarp 4-valved. Nut quadrangular, even.

Monoecia. Polyandria.

- 1. C. sulcata Nutt.: leafets generally 9, obovate-lanceolate, acuminate, scrrate, pubescent beneath, terminal one subsessile and attenuate at base; fruit roundish, 4-angled; nut oblong, slightly compressed, conspicuously mucronate.—Juglans sulcata Willd.—J. mucronata Mich. and J. laciniosa Mich. f.
 - HAB. Fertile soils. N. Y. to Car. April, May. b.—A large tree. Leaves pinnate, with 7—9 leafets. Sterile aments 3-parted, very long, peduncled. Nut large, oblong, with a very thick 4-parted pericarp.—This, like most of the species, is valuable for fuel.

 Thick Shell-bark Hickory.
- 2. C. alba Nutt.: leafets 5—7, on long petioles, oblong-lanceolate, acuminate, sharply serrate, villous beneath, the terminal one sessile; aments filiform, smooth; fruit depressed-globose; nut compressed, oblique.—Juglans alba Mich.—J. compressa Willd.—J. squamosa Mich.f.
 - HAB. Fertile woods. Can. to Car. and W. to Miss. April, May. b.—A very large and valuable tree, with the bark separating in large flat scales or plates. Nut with a thinner shell than that of most other species and of a fine flavor; pericarps thin, globose, depressed at the summit.—Timber much prized in consequence of the fineness of the grain and the elasticity of the fibre.

 Shell or Shag-bark Hickory.
- 3. C. tomentosa Nutt.: leafets generally 7-9, oblong-lanceolate, acuminate, smooth, slightly serrate, pubescent and scabrous beneath; terminal one nearly sessile; ament filiform, very long, tomentose; fruit subglobose, smooth; pericarp very thick; nut somewhat 6-angled, the shell very thick and hard.—Juglans tomentosa Mich.—J. alba Linn.
 - b. maxima Nutt.: fruit twice the ordinary size, as large as an apple.
 - •Hab. Fertile woods. N. Y. to Geor. April, May. 5.—A large tree. Leafets sometimes 5, but generally 7, very pubescent beneath. Fruit large. Nut compressed, somewhat oval, with 4 prominent angles, and 2 obscure ones on the ends, thick shelled and hard. Timber valuable. Var. b. is found near Philadelphia.

 Common Hickory.
- 4. C. amara Nutt.: leafets generally 9, ovate-oblong, acuminate, sharply serrate, smooth on both sides; fruit subglobose; nut smooth, mucronate, with the shell fragile.—Juglans amara Mich.—Hicorius amara Raf.
 - Hab. Dry fertile woods. Can. to Car. May. 5.—A large tree. Leafets 9, sessile, with the nerves and midrib pubescent. Nut small, almost obcordate, with bitter and astringent kernels.—Often confounded with the next species.

Bitter-nut. Swamp Hickory.

- 5. C. porcina Nutt.: leafets generally 7, lanceolate, acuminate, serrate, smooth on both sides; fruit oblong-globose or obcordate; nut smooth, very hard.—Juglans porcina Mich.—J. obcordata and J. glabra Willd.
 - HAB. Fertile woods. N. Y. to Geor. May. b .- A very large

tree. Leafets 5-7. Fruit small, variable, with a very bitter kernel.-Wood very tough. Pig or Hog-nut. Broom Hickory.

ORDER CXIV. CONIFEREA. Juss. Lind.

Flowers monoecious or dioecious. Sterile monandrous or monadelphous, collected in an ament about a common rachis; anthers 2 or many-lobed, bursting outwardly; often terminated by a crest, which is an uncovered portion of the scale, out of which each stamen is formed. Fertile usually in strobiles or cones, sometimes solitary. Ovary none (in the solitary flower,) or spread open (in the cone) and resembling a flat scale, destitute of style or stigma, arising from the axil of a membranous bract; ovules exposed; in the cones in pairs on the face of the ovary, inverted; in the solitary flower erect. Fruit a solitary naked seed, or a cone. Seeds with a hard crustaceous integument; embryo in the midst of oily albumen; radicle next the upex of the seed, having an organic connexion with the albumen.

Trees or shrubs, with a branched trunk, abounding in resin. Leaves with the veins parallel to each other.

1. JUNIPERUS. Linn.

Dioecious, rarely monoecious. STERILE FL. Ament ovate; scales verticillate, peltate. Anthers 4-S, 1-celled. FERTILE FL. Ament globose; scales 3, concave, coadunate. Stigma gaping. Berry with 3 bony 1-seeded nuts, surrounded with the united and fleshy scales.

Dioecia. Monadelphia.

- 1. J. communis Linn. : leaves ternate, spreading, mucronate, longer than the berry.
 - b. depressa Pursh: stems prostrate.
 - HAB. Rocky banks of streams. Can. and N. S. May. 5 .-A shrub with prostrate and spreading branches, forming large beds. Leaves sharply mucronate, glaucous above, shining below. Berries purple. Medicinal. Big. Med. Bot. iii. 44. Juniper
- 2. J. virginiana Linn.: trunk arboreous; upper leaves imbricated in four rows, ovate, pungently acute.
 - Woods. Can. to Geor. May. b .- A middle-sized tree, with horizontal branches. Berries covered with a blue powder. -Wood light and very durable. Leaves resembling Savin in their medicinal properties.
 - 3. J. prostrata Mich.: stems prostrate, creeping; leaves imbricate,

in four rows, ovate, submucronate, glandular in the middle, appressed; berries large and conspicuously tubercular.—J. repens Nutt.

HAB. Sandy soils. Can. and N. S. W. to Miss. May. b.—

A low shrub, with long and creeping branches, 2 yards long.

THUYA. Linn. 2.

Monoecious. STERILE FL. Ament imbricate. Perianth none. Anthers 4, sessile. FERTILE FL. Strobile with the scales 2-flowered. Nut 1, winged.

Monoecia. Monadelphia.

T. oecidentalis .Linn. : branches ancipitous; leaves imbricated in 4 rows, ovate-rhomboidal, appressed, tuberculate; strobiles obovate; inner scales truncate, gibbous below the summit.

HAB. Mountains. Can. to Car. May. b .- A small tree, with

very tough branches. Leaves resembling scales.

American Arbor Vita.

3. CUPRESSUS. Linn.

Monoecious. Sterile Fl. Ament ovate; scales peltate. Perianth none. Anthers 4, sessile. Fertile Fl. Stro-bile with the scales peltate. Perianth none. Ovaries 4—S, under each scale of the strobile. Nuts angular, compressed.

Monoecia. Monadelphia.

1. C. disticha Linn. : leaves distichous, flat, deciduous; sterile flowers leafless, paniculate; strobile subglobose.

Hab. Swamps. N. J. to Flor. W. to Miss. May. 5.—One of the largest trees of the forest, occurring in extensive swamps, especially at the South. Leaves small, linear and acute. Cone with an irregular surface.—Timber very durable. Cypress.

2. C. thyoides Linn.: branches compressed; leaves imbricate in four rows, ovate, tuberculate at base; strobile globose.

Hab. Swamps. N. Y. to Car. May, P.—A middle-sized tree, composing the ccdar swamps of the Middle and Southern States. -Wood light, soft and durable. White Cedar.

4. PINUS. Linn.

Monoecious. Sterile Fl. Scales peltate. Perianth none. Anthers 2, sessile, 1-celled. FERTILE FL. in an ovate or conical strobile. Scales closely imbricate, 2-flowered. Nut winged, covered by the scales of the cone.

Monoecia. Monadelphia.

- * Leaves 2-5, sheathing at base. Seales of the cone thickened at the summit. PINUS.
- 1. P. inops Ait.: leaves short, in pairs; strobile recurved, oblongconic, as long as the leaves; spines of the scales subulate, straight.

- HAB. Barrens. N. Y. to Car. May. Q.—A middle-sized tree, with straggling branches and full of resin. Leaves 1—2 inches long. Caues about 2 inches long. Pitch or Scrub Pine.
- 2. P. resinosa Ait.: leaves elongated, in pairs; sheaths elongated; strobile ovate-conic, rounded at base, subsolitary, half the length of the leaves; scales dilated in the middle, unarmed.—P. rubra Mich.

HAB. Woods. Can. and N. S. May. 5.—A very large tree. Found on the Helderburg mountains near Albany.

Norway Pine.

- 3. P. banksiana Lamb.: leaves short, in pairs, rigid, divaricate, oblique; strobile recurved, tortuous; scales unarmed.—P. rupestris Mick. f.
 - Hab. Rocky grounds. Subarc. Amer. to Maine. April, May. P.-A small tree, with long spreading flexible branches.

Serub Pine.

- 4. P. variabilis Lamb: leaves elongated, in pairs and threes, channelled; strobile ovate-conic, mostly solitary; spines of the scales incurved.—P. mitis Mich f.
 - HAB. Forests. N. Eng. to Geor. May. 5.—A large tree. Leaves 4—5 inches long, dark green. Conc solitary, 2—3 inches long. Yellow Pine.
- 5. P. rigida Linn.: leaves in threes; sheaths short; sterile aments erect-incumbent; strobile ovate, scattered or aggregated; spines of the scales rcflexed.
 - Hab. Barrens. N. Eng. to Vir. May. 5.—A large tree.

 Leaves 4—6 inches long. Cones usually clustered, 2—4 inches long.—The wood abounds in turpentine.

 Pitch Pine.
- 6. P. scrotina Mich.: leaves elongated, in threes; sterile aments incumbent, nearly crect; strobile ovate; spines of the scales straight, slender.
 - Hab. Margin of swamps. N. J. to Car. May. 7.—A small tree. Leaves 6—8 inches long. Cones larger and more globular than in the preceding. Pond Pine.
- 7. P. strobus Linn.: leaves in fives, slender; sheaths very short; strobile pendulous, cylindrical, longer than the leaves; scales loose.
 - Hab. Fertile soils. Can. to Vir. May. b.—A very large and valuable tree, sometimes attaining the height of 140 feet.

 Leaves 4 inches long. Cone solitary, very long.—Timber soft fine-grained and light.

 White or Weymouth Pine.
 - ** Leaves fasciculate, deciduous. LARIX.
- 8. P. pendula. Ait.: leaves fasciculate, deciduous; strobile oblong; margin of the scales inflexed; bracts panduræform, with the point attenuated.
 - Hab. Cedar swamps. Can. and N. Y. April, May. P.—A middle-sized tree, which differs from the preceding by its leaves growing in tufts or fascicles, and in their being deciduous. Cone small, covered with soft scales. Hackmatack. Tamarack.

9. P. microcarpa Lamb.: leaves fasciculate, deciduous; strobile roundish, few-flowered; scales reflexed; bracts elliptic, obtusely acuminate .- P. pendula Willd .- Larix americana Mich.

HAB. Mountains. N. S. N. to Subarc. Amer. May. b .- A large tree, resembling the preceding, but according to Pursh and Lambert, specifically distinct.

Red Lareh.

*** Leaves solitary, distinct at base. Scales of the conc even and attenuated. Abies.

- 10. P. balsamea Linn.: leaves solitary, flat, emarginate or entire, glaucous beneath, somewhat pectinate at the summit, nearly erect, below recurved-spreading; strobile cylindrical, erect; bracts short, obovate, conspicuously mucronate, somewhat serrulate. - Abics balsamifera Mich.
 - HAB. Mountains. N. S. N. to Subarc. Amer. May. tree 40-50 feet high. Leaves 6-10 lines long. Cone solita-American Silver Fir. Balsam Fir.
- 11. P. fraseri Pursh: leaves solitary, flat, shorter, emarginate, glaucous beneath, subsecund, erect above; strobile ovate-oblong, erect; bracts elongated, reflexed, oblong-cuneate, emarginate, shortly mucronate, incisely toothed. P. balsamea var. fraseri Nutt.

HAB. Broad Mountains. Penn. Pursh. May. b .- Resembles the former, but differs in being a smaller tree, the leaves shorter and more erect, and the cones not one-fourth the size.

Double Balsam Fir-

12. P. canadensis Linn.: leaves solitary, flat, denticulate, somewhat distichous; strobile ovate, terminal, scarcely longer than the leaves. -Abies canadensis Mich.

Mountains. Can. to Car. May. 5 .- A tree sometimes HAR. attaining a very large size. Leaves 6-8 lines long. Cones very small -Bark contains a great quantity of tannin.

Hemlock Spruce-

13. P. nigra Ait.: leaves solitary, 4-sided, every where scattered, erect, straight; strobile ovate; scales elliptical, undulate on the margin, erosely denticulate at the apex.—A. nigra Mich. f.

р.—А large HAB. Swamps. Subarc. Amer. to Car. May. tree, usually having a pyramidal summit. Leaves half an inch long, dark green. Cones oval, 1-2 inches long. Black Spruce.

14. P. rubra Lamb.: leaves solitary, subulate; strobile oblong, obtuse; scales rounded, somewhat 2-lobed, entire on the margin.

HAB. Hudson's Bay. Pursh. Maine. Torr. May. b.

Red Spruec.

15. P. alba Ait.: leaves solitary, 4-sided, incurved; strobile subcylindrical, loose; scales obovate, very entire.

HAB. Swamps. Subarc. Amer. to Car. May. b .- A small tree. Leaves 5-8 lines long, less crowded than in the preceding. Cones slender, 2 inches long. White Spruce.

5. TAXUS. Linn.

Flowers [dioecious or monoecious, surrounded with many scales. Sterile Fl. Stamens 8—10; filaments monadelphous. Anthers peltate, 6—8-celled; cells dehiscent beneath. Fertile Fl. Style none. Stigma concave. Drupe fleshy, open at the extremity. Nut 1-seeded.

Dioecia. Monadelphia.

T. canadensis Willd.: leaves linear, distichous, revolute on the margin; receptacle of the sterile flower globose.—T. baccata minor Mich.

HAB. Moist rocky places. Can. and N. S. March, April. 5.

—Shrub 4—8 feet high. Leaves resembling those of Pinus canadensis, but larger. Fruit having the appearance of a berry.

Venn.

CLASS II. ENDOGENÆ OR MONOCOTYLEDO-NOUS PLANTS.

Trunk usually cylindrical, with no perceptible distinction of bark, wood and pith, increasing in diameter by the addition of new matter to the centre. Leaves frequently sheathing at the base and not readily separating from the stem by an articulation, mostly alternate, with parallel simple nerves and minute transverse veins. Embryo with but one cotyledon; if with two, then the additional one is imperfect and alternate with the other; radicle usually enclosed within the substance of the embryo, through which it bursts when germinating.

SUBCLASS I. PETALOIDEÆ. Lind.

Stamens and pistils naked or covered by verticillate floral envelopes.

ORDER CXV. HYDROCHARIDEÆ. Juss. Lind.

Flowers spathaceous, monoclinous or diclinous. Perianth with the limb 6-parted, the 3-outer segments herbaceous; the 3 inner petaloid. Stamens epiginous, definite or indefinite. Ovary solitary, 1 or many-celled; ovules indefinite, often pa-

rietal; stigmas 3-6. Fruit dry or succulent, indehiscent, 1 or many-celled. Seeds without albumen; embryo undivided, cylindrical; radicle at the opposite extremity from the hilum.

Floating plants. Leaves with parallel nerves, sometimes spiny.

1. UDORA. Nutt.

Dioecious. Spathe bifid. Perianth 6-parted; 3 inner segments petaloid. Sterile Fl. Stamens 9, 3 of them interior. Fertile Fl. Tube of the perianth very long. Sterile filaments 3. Utriculus about 3-seeded. Seeds cylindric.

Dioecia. Enneandria.

U. canadensis Nutt.: leaves verticillate in threes and fours, lanceolate, oblong or linear, serrulate; tube of the perianth filiform.—Elodca canadensis Mich.—Scrpicula verticillata Muhl.

Hab. Still waters. Can. to Vir. Aug. 21.—Stem submersed, diffusely dichotomous. Flowers axillary, very small, white. The plant without flowers resembles an aquatic moss.

2. VALLISNERIA. Linn.

Dioecious. Sterile Fl. Spathe ovate, 2—4-parted. Spadix covered with minute flowers. Perianth 3-parted. Stamens 2. Fertile Fl. Scape very long and spiral. Spathe bifid, 1-flowered. Perianth elongated, 6-parted; the alternate segments linear. Style none. Stigmas 3, ovate, bifid. Capsule elongated, cylindrical, 3-toothed, 1-celled, many-seeded; the seeds attached to the sides.

Dioecia. Diandria.

V. spiralis var. americana Torr. leaves linear and obtuse, equal from the base, 3-nerved, margin minutely and aculeately serrulate; sterile peduncles very short; fertile ones spiral.—V. americana Mich.

Hab. Still water. N. Y. to Flor. W. to Ill. Aug. 21.—Leaves all radical, 2—3 lines broad and very long.

ORDER CXVI. ORCHIDE Æ. Juss. Lind.

Perianth with a ringent 6-parted limb; outer segments usually coloured, of which the odd one is often uppermost by a twisting of the ovary; inner segments more petaloid, the odd one or the lip being frequently lobed and unlike the others, and often spurred at the base. Stamens 3, in a double row, epiginous, united in a central column, the two lateral ones, or the central one abortive; anther persistent or deciduous, 2-4 or 8-celled; pollen powdery or cohering in definite or indefi-

nite waxy masses (pollinia.) Ovary 1- rarely 3-celled; ovules indefinite; style forming part of the column of the stamens; stigma a viscid cavity in front of the column. Capsule 3-ribbed, 3-valved, rarely baccate. Seeds numerous; albumen none; embryo a solid fleshy mass.

Herbs. Roots tuberous or fibrous. Leaves simple, quite

entire.

* Pollen simple or consisting of granules in a lax state of cohesion.

1. GOODYERA. Brown.

Perianth ringent; the 2 outer or lateral segments placed beneath the *lip*, which is gibbous at the base and undivided at the extremity. Column free. Pollen angular.

Gynandria. Monandria.

1. G. pubcscens Brown: radical leaves ovate, petiolate, reticulate; scape sheathed and with the flowers pubescent; lip ovate, acuminate; segments of the perianth ovate.

HAB. Shady woods. Can. to Flor. July, Aug. 21.—Scape 6—10 inches high. Leaves radical, dark green, veined with white. Flowers white, in an oblong spike.

Rattlesnake Plantain.

2. G. repens Brown: radical leaves ovate, petiolate, reticulate; scape sheathed and with the flowers pubescent; flowers unilateral; lip and segments lanceolate.

IIAB. Shady woods. N. S. July. 24,—Root creeping. Scape 6—8 inches high. Leaves less distinctly veined than in the preceding. Flowers greenish-white.

2. SPIRANTHES. Rich.

Spike spiral; inner segments of the perianth connivent. Lip unguiculate, parallel with the column, with 2 calli at the base, entire. Anther terminal, peduncled at the end. Ovary oblique. Gynandria. Monandria.

1. S. tortilis Rich.: radical leaves linear; scape sheathed; flowers spirally secund; lip trifid; the middle lobe large and crenulate.—Neotia tortilis Swartz. Pursh.—Ophrys astivalis Mich.

HAB. Low meadows. N. Y. to Car. June, July. 21.—Scape a foot high. Flowers white.

2. S. gracilis Beck: radical leaves ovate; scape sheathing; flowers in a spiral row; lip obovate, curled.—Neottia gracilis Big.

HAB. Dry woods. Mass. July. 5.—Scape 8-12 inches high, erect, with a few sheathing scales or leafets. Leaves on short

petioles, sometimes falling off before the plant flowers. Flowers white, in a twisted spike.—According to Dr. Bigelow, the spike is sometimes unilateral and scarcely twisted, and the flowers more slender, when it forms his var. secunda. Ladies' Tresses.

3. S. cernua Rich.: leaves lanceolate, nerved; stem sheathing; flowers in a dense spike, cernuous; lip oblong, entire, acute.—Neottia cernua Willd.

Har. Moist grounds. Can. to Car. July, Aug. 21.—Scape 6 inches to 2 feet high, sometimes a little leafy. Leaves varying from linear-lanceolate to oblong-lanceolate. Flowers greenish-white.—It is liable to considerable variation. See Torr. Comp. 320.

3. LISTERA. Brown.

Perianth irregular. Lip 2-lobed, sessile, with no calli. Column wingless, (minute.) Anther fixed by its base. Pollen farinaceous. Gynandria. Monandria.

1. L. cordata Brown: stem with only 2 opposite roundish cordate leaves; raceme loose; column without any appendage behind; lip elongate, 2-toothed at base, deeply bifid, the segments divaricate and acute—Ophris cordata Mich.

Hab. Sphagnous swamps. Can. Ver. N. J. May. 24.—Stem 4—8 inches high. Leaves roundish, cordate, veined, smooth, mucronate. Raceme 7—15-flowered. Flowers distant, minute, green and purple. Tway-blade.

2. L. convallarioides Nutt.: stem with only 2 opposite oval-roundish leaves, pubescent above; raceme few-flowered, (4-6); column porrected; lip oblong, dilated, and obtusely 2-lobed at the extremity.—

Epipaetis convallarioides Pursh. excl. syn.

Hab. Swamps. Can. to Car. May. 21.—Stem 6 inches high and very slender. Flowers dark brown and green, larger than in the preceding.—These two species have been confounded by many of our botanists—when in fact they are entirely distinct, and it is even doubtful whether they belong to the same genus. Ophris cordata of Michaux given by Pursh as a synonym of his Epipactis convallarioides, belongs to the former.

4. POGONIA. Brown.

Lip sessile, cucullate, internally crested; 5 segments of the perianth distinct, without glands. Pollen farinaceous.

Gynandria. Monandria.

1. P. ophioglossoides Brown: root fibrous; stem with an oval-lanceolate leaf and a foliaceous bract near the flower; lip fimbriate.—Arethusa ophioglossoides Linn.

IAB. Sphagnous swamps. Can. to Car. July. 21.—Root fasciculate. Stem 8—12 inches high. Flower solitary, pale pur-

ple, nodding.

2. P. verticillata Nutt.: leaves 5, oblong-lanceolate, verticillate; flower solitary; 3 outer segments of the perianth very long and linear; the inner ones lanceolate, obtuse; lip 3-lobed, dilated, the middle lobe undulated.—Arethusa verticillata Willd.

HAB. Swamps. N. Y. to Geor. June, July. 24.—Root fasciculate. Stem about a foot high. Leaves 5 in a whorl at the top of the stem. Flower solitary; outer segments brown, 2 inches

long; inner ones short, paler and obtuse.

5. CALOPOGON. Brown.

Lip behind (or inverted,) unguiculate, the lamina bearded; 5 segments of the perianth distinct. Column free. Pollen angular. Gynandria. Monandria.

C. pulchellus Brown: radical leaves ensiform; scape few-flowered.

-Cymbidium pulehellum Willd. Pursh.

Hab. Swamps. Can. to Flor. June, July. 24—Root bulbous. Stem 12—18 inches high. Leaf generally solitary, 8—10 long, sheathing the base of the stem. Flowers 3—4 in a terminal spike, large, purple.

6. CORALLORHIZA. Brown.

Lip produced behind, adnate with the spur or free. Column free. Pollinia 4, oblique, not parallel.

Gynandria. Monandria.

- 1. C. verna Nutt.: leafless; segments of the perianth linear-lancelate, spreading; lip oblong, without spots, bidentate at the base, the apex recurved and ovate; spur obsolete, adnate.—Cymbidium corallorhizon Muhl.
 - IIAB. Sphagnous swamps. N. S. May. 21.—Root coralloid. Scape 5—6 inches high, with about 3 sheathing stipules. Flowers 7—15, small, yellowish-green. Lip nearly white, oblong-oval, without spots.—Mr. Nuttall in his "Genera of N. A. Plants," confounds this plant with the C. innata of Europe, a mistake which he corrects in his valuable paper on the species of Corallorhiza, indigenous to the United States, published in the Mem. of the Phil. Acad. of Nat. Sciences, from which the present descriptions are taken.
- 2. C. odontorhiza Nutt.: leafless; lip oval, undivided, spotted; spur obsolete, adnate; capsule subglobose.—Cymbidium odontorhizon Willd.
 —Ophrys corallorhiza Mich.
 - Hab. Roots of trees. Ver. to Car. Aug., Sept. 21.—Root much branched. Scape 10—12 inches high, slender, with about 3 sheaths. Flowers numerous, purplish. Lip dilated, white and beautifully spotted.

 Dragon's Claw.
- 3. C. multiflora Nutt.: leafless; seape many-flowered, (15-30;) lip euneate-oval, 3-parted, recurved, spotted; spur conspicuous adnate. C. innata Nutt. Gen.

HAB. Roots of trees. N. Y. to Car. July—Sept. 21.—Root coralloid, much branched. Scape a foot high, with 3—4-sheaths. Raceme with many-flowers which are purplish, with the lip white and spotted; spur very distinct, yellowish.

7. APLECTRUM. Nutt.

Lip unguiculate, not produced at the base. Anther situated below the summit of the column. Pollinia 4, oblique, lenticular. Gynandria. Monandria.

A. hiemalis Nutt.; leaf solitary, ovate, striate; lip trifid, obtuse, with the palate ridged; central lobe rounded, crenulate.—Cymbidium hyemale Willd. Pursh.

Hab. Shady woods. Can. to Flor. May, June. 21.—Root bulbous. Scape a foot high, sheathed. Flowers brownish, at length pendulous. Lip dilated at the end and trifid.

8. ARETHUSA. Linn.

Lip united at base with the column, cucullate at the end, crested internally; 5 segments of the perianth united at base. Pollen angular.

Gynandria. Monandria.

A. $bulbosa\ Linn.$: leafless; root bulbous; scape sheathed, 1-flowered.

Hab. Sphagnous swamps. Can. to Car. May, June. 21.— Stem 6—10 inches high, the lower part with 3 or 4 sheaths. Flowers 1, rarely 2, terminal, large, purple. Lip curled, crenate, bearded in the middle.

9. TRIPHORA. Nutt.

Lip unguiculate, cucullate; 5 segments of the perianth distinct, equal and connivent, without glands. Column spathulate, complanate and apterous. Pollen farinaceous.

Gynandria. Monandria.

T. pendula Nutt.: root tuberous; stem leafy, about 3-flowered at the summit; leaves ovate, alternate; flowers pedunculate; peduncles at length recurved.—Arethusa pendula Willd.—Pogonia pendula Lind.

Hab. Roots of trees. N. Y. to Geor. W. to Ky. Sept. 21.
—Stems often in clusters, a span high, angular. Leaves 6 or 7, remote, very short, clasping, ovate and acute. Flowers 3 or 4, pale purple, on axillary and terminal peduncles.

** Pollen adhering in granules, which finally become waxy and are indefinite in number.

10. ORCHIS. Linn.

Perianth ringent. Lip with a spur on the under side at

the base. Glands of the stalks of the pollinia (1-2) contained in one common little pouch. Gynandria. Monandria.

O. spectabilis Linn.: lip obovate, undivided, erenate, retuse; segments of the perianth connivent, longer; spur clavate, shorter than the ovary; bracts longer than the flower; scape few-flowered, angular, scarcely longer than the erect leaves .- Orchis humilis Mich .- Habernaria spectabilis Spreng.

HAB. Shady woods. N. Y. to Car. June. 21.-Scape 6-8 inches high, angular. Leaves mostly 2, large. Flowers large,

purple and white.

11. PLATANTHERA. Rich.

Perianth vaulted. Lip entire, with a spur. Cells of the anther widely divided at their base by the broad interposed stigma. Glands of the pollinia naked. Lips of the stigma absent. Gynandria. Monandria.

1. P. orbiculata Lind.: lip linear-lanceolate, obtuse; three upper segments of the perianth erect, connivent; lateral ones reflexed, oblique at the base; spur longer than the germ; scape with 2-orbicular leaves at the base. - Orchis orbiculata Pursh.

Hab. Shady woods. N. S. July. 21.—Scape 12—18 inches high. Leaves very large, fleshy, spreading on the ground. Flowers greenish-white, in a loose spike.

2. P. dilatata Lind.: lip linear, very entire, rather obtuse, rounded and dilated at base; spur as long as the lip, a little shorter than the germ; stem leafy; bracts as long as the flower .- Orchis dilatata Pursh.

HAB. Woods. N. S. July. 24.—Stem 2—3 feet high. Leaves numerous. Flowers greenish or white.

12. HABERNARIA. Willd.

Perianth ringent. Lip spurred on the upper side at the base beneath. Glands of the stalk of the pollinia naked and distinct; cells of the stalks adnate, or separated.

Gynandria. Monandria.

1. II. herbiola Brown: lip oblong obtuse, bidentate at base; palate 1-toothed; spur filiform, shorter than the germ; bracts longer than the flower.

HAB. Swamps. N. S. June. 21.-Stem 12-18 inches high. Flowers small, greenish.

2. H. virescens Spreng: lip lanceolate, crenate; segments of the perianth connivent obtuse; spur obtuse, didymous; bracts longer than the flower .- Orchis virescens Willd.

HAB. Boggy meadows. Penn. July. 21.-Stem 12-18 inches high. Flowers green.

3. H. huronensis Spreng.: lip lanceolate, acuminate, incurved; segments of the perianth connivent, subulate; spur about the length of the lip, incurved; stem leafy.

HAB. Wet grounds. N. Y. W. to Mich. Aug. 24.

- 4. H. integra Spreng.: lip oblong, very entire, longer than the inner segments of the perianth; spur subulate, longer than the germ; bracts shorter than the flower; stem leafy.—Orchis integra Nutt.
 - HAB. Swamps. N. J. July. 24 —Flowers orange yellow, somewhat smaller than in H. ciliaris, to which this species is nearly allied.
- 5. H. obsoleta Spreng.: lip lanceolate, very entire; segments of the perianth erect; spur obtuse, didymous, as long as the germ; germ pedicillate; bracts very short; scape naked.—Orchis obsoleta Willd.

HAB. Shady places. N. Y. to Vir.; rare. July, Aug. 24-Bracts very short.

6. H. bracteata Brown: lip linear, retuse, obscurely 3-toothed at the extremity; segments of the perianth connivent; lateral ones ovate and broader; spur obtuse, very short, didymous; bracts spreading, much longer than the flower.—Orchis bracteata Willd.

HAB. Shady places. Vir. July, Aug. 24.—Stem 8—12 inches high, leafy. Flowers green, in a loose spike.

7. H. tridentata Hook.: lip ovate-lanceolate, obtuse, 3-toothed; segments of the perianth connivent, obtuse; spur filiform, incurved, longer than the germ.—Orchis tridentata Willd.

Hab. Swamps. Penn. and Vir. June, July. 24.—Stem 1-2 feet high. Flowers small, white.

8. H. ciliaris Brown.: lip oblong-lanceolate, pinnately ciliate, twice as long as the segments; spur longer than the germ.

Hab. Swamps. Can. to Car. June, July. 21.—Stem 1—2 feet high, leafy, smooth. Flowers in a dense terminal spike, orange yellow. Lip finely laciniate or fringed.

- 9. H. cristata Brown: lip oblong, pinnately ciliate; segments of the perianth rounded; the two lateral ones toothed; spur shorter than the germ.—Orchis cristata Mich.
 - HAE. Swamps. Penn. to Car. June, July. 21.—Stem 1—2 feet high, leafy. Flowers in a terminal spike, somewhat crowded, yellow. Distinguished from the former by its smaller flowers and more dense spike.
- 10. blephariglottis Hook.: lip lanceolate, fimbriate, as long as the upper segment of the perianth; spur filiform, pendulous, longer than the germ.—Orchis blephariglottis Willd.
 - HAB. Swampy grounds. N. J. to Car. June, July. 21.—Stem 2 feet high. Flowers pure white. Resembles the former and is not very readily distinguished except by its white flowers.
 - 11. H. elliottii Beck: lip ovate, toothed and crenate; spur filiform,

attenuate, about as long as the germ; spike crowded; bracts as long as or a little longer than the flower.—Orchis flava? Ell.—O. flava? Torr.

- HAB. Low grounds. N. S. to Geor. July. 21.—Stem 2 feet high. Flowers in a short crowded spike, yellow. Lip with the sides toothed or crenate, almost fimbriate. Spur subulate, nearly acute at the point.—This plant appears to differ much from the original O. flava of Clayton. See Ell. Sk. ii. 485.
- 12. H. fissa Brown: lip 3-parted; lobes cuneiform, dentate; intermediate one 2-lobed; spur filiform, clavate at the extremity, ascending, longer than the germ.—Orchis fissa Willd.

HAB. Mountain meadows. Penn to Vir. Pursh. July. 21.— Stem 2—4 feet high. Flowers dark purple.

- 13. H. incisa Spreng.: lip 3-parted; lobes cuneiform, incisely dentate, the intermediate one emarginate; lateral segments of the perianth obtuse, subdentate; spur subulate, ascending, as long as the germ.—Orchis incisa Willd.
 - HAB. Meadows. N. Y. to Vir. July. 21.—Stem 2-4 feet high. Flowers purple.
- 14. H. fimbriata Brown: lip 3-parted; lobes all cuneiform and incisely fimbriate; segments of the perianth oval, spreading, fimbriate-toothed; spur filiform, clavate, longer than the germ.—Orchis fimbriata Ait.
 - HAB. Meadows. Can. and N. S. July. 2f.—Stem 2 feet high. Leaves broad-lanceolate. Flowers purple, in a large spike.
- 15. H. psycodes Spreng.: lip 3-parted, capillary, many-cleft; segments of the perianth obtuse; spur filiform; clavate, ascending, a little longer than the germ.—Orchis psycodes Linn.—O. lacera Mich.
 - HAB. Meadows. Can. to Vir. July. 21.—Stem 2 feet high. Leaves oblong. Flowers numerous, pale yellow, in a large terminal spike.
- 16. H. fuscescens Torr.: lip ovate, toothed at the base; segments of the perianth spreading; spur subulate, as long as the germ; bracts longer than the flower.—Orchis fuscescens Linn.
 - Hab. Mountain meadows. N. S. July. 21.--Flowers in very long spikes, brownish-yellow. Bracts acuminate, very long.
- 17. H. macrophylla Goldie: lip linear-elongated, entire, acuminate; spur longer than the germ, terete, nearly straight; upper segments of the perianth ovate, acute; scape with broad oval suberect leaves at the base.
 - HAB. Shady woods near Montreal. Goldie. N. S. Torr.—The largest of the North American Orchidem. Leaves 2, radical, 6—8 inches in length, thin and pellucid, elliptical. Scape with a few lanceolate scales. Flowers large and arranged in a lax spike of 5 or 6 inches in length. See Goldie in Edin. Phil. Jour. vi. 331.
- 18. H. grandiflora Torr.: lip dependent, twice as long as the segments of the perianth, 3-parted; lobes cunciform, frimbriate, the raid-

dle one largest, with the fimbriæ connivent; lateral segments fimbriate; spur ascending, clavate, longer than the germ; leaves oval-ob-

long .-- Orchis grandiflora Big.

Hab. Meadows. Mass. and N. H. Big. June. 21.—Stem 2 feet high, thick and angular. Flowers in an oval-oblong spike, pale purple, twice the size of H. fimbriata, from which it also differs in the form of the lip.

13. TIPULARIA. Nutt.

Segments of the perianth spathulate, spreading. Lip entire, sessile, conspicuously calcarate below at the base. Column wingless, porrected, free. Anther operculate, persistent. Pollinia 4, parallel. Gynandria. Monandria.

T. discolor Nutt.—Orchis discolor Pursh.—Limodorum uniflorum Muhl.

Hab. Pine woods. Ver. to Car. July. 24.—Root bulbous.

Leaf solitary, ovate, petiolate, plaited, smooth. Flowers in a terminal raceme, nodding, minute, greenish and destitute of bracts.

*** Pollen cohering in grains, which finally become waxy, and are definite in number.

14. LIPARIS. Rich.

Perianth spreading. Lip flat, expanded, entire, turned various ways. Column winged. Pollinia 4, with neither caudicula nor glands. Gynandria. Monandria.

1. L. liliifolia Rich.: leaves 2, ovate-oblong; scape angular; flowers racemose; segments of the perianth linear; lower ones setaceous, reflexed: lip concave, obovate, mucronate at the tip.—Malaxis liliifolia Swartz. Pursh.

HAB. Wet woods. Can. to Car. June, July. 21.—Scape 6-8 inches high. Flowers in a short raceme, yellowish and white.

2. L. correana Spreng: leaves 2, ovate-oblong; scape angular; segments of the perianth revolute on the margin; lip oblong keeled, recurved and cordate at the apex.—Malaxis correana Bart. Nutt.

Hab. Wet woods. Can. and N. S.—Stem 6—8 inches high, angled and winged, with 2 opposite leaves at the base. Flowers yellowish-green, in a terminal spike. Resembles L. lasclii of Europe, but that species has a triangular stem and its lip entire and shorter than the perianth. Dr. Graham in Edin. New Phil. Jour. v. 377.

15. MICROSTYLIS. Nutt.

Lip flat, sagittate or deeply cordate. Column very small, round. Pollinia 4, loose. Gynandria. Monandria.

M. ophioglossoides Nutt.: scape 1-leaved; leaf ovate, amplexicaule; lip truncate, emarginate.

IIAB. Roots of trees. N. S. June. 21.—Root bulbous. Scape a span high, 1-leaved, with a foliaceous sheath near the base, many-flowered. Flowers minute, greenish-white.

16. CALYPSO. Salisb.

Segments of the perianth ascending, secund. Lip ventricose, spurred beneath near the end. Column petaloid, dilated. Pollinia 4. Gynandria. Monandria.

C. americana Brown: lip narrowed and subunguiculate at base; spur semibifid, longer than the lip, with acute teeth; peduncle longer than the ovary.—C. borealis Pursh.—Limodorum boreale Willd.

Hab.. Near Montreal. N. to Nova Scotia. Near the outlet of Lake Michigan and W. to the Columbia river.—Scape 6—8 inches high, sheathed, 1-flowered. Radical leaf roundish-ovate, nerved. Flower large, purplish, somewhat resembling a species of Cypripedium.—I have received a specimen of this beautiful plant from Dr. Holmes, of Montreal, gathered near that place, and I have introduced the species in the hope that it may yet be found in the northern part of our state.

**** Lateral anthers fertile; the middle one sterile and petaloid.

17. CYPRIPEDIUM. Linn.

Lip ventricose, inflated, saccate, obtuse. Column terminating in a petaloid lobe. Two under segments of the perianth united, (or 4 segments with the under one bifid.)

Gynandria. Diandria.

1. C. candidum Willd.: stem leafy; leaves oblong-lanceolate; lobe of the style lanceolate, rather obtuse; lip compressed, shorter than the lanceolate segments of the perianth.

HAB. Penn. Muhl. May. 21.—Resembles C. ealecolus; but the flowers are white, and not half the size: the form of the leaves and the lobe of the style distinguish it sufficiently. Pursh. White Ladies Stipper.

2. C. parviflorum Willd.: stem leafy; lobe of the style triangular, acute; outer segments of the perianth ovate-oblong, acuminate; inner ones linear, contorted; lip compressed, shorter than the perianth.—C. calecolus Mich.

HAB. Woods. N. Y. to Car. May, June. 21.—Stem 12 inches high, creet. Leaves clasping, oval, nerved. Perianth green, spotted with dark purple; lateral segments linear, twisted, hairy on the side. Lip yellow, spotted. Yellow Ladies Stipper.

3. C. pubescens Swartz: stem leafy; lobe of the style triangular-ob-

long, obtuse; outer segments of the perianth ovate-oblong, acuminate; inner ones very long, linear, contorted; lip compressed, shorter than the petals.—C. caleeolus var. Linn.

HAB. Woods. Subarc. Amer. to Car. May. 21.—Stem 1—3 feet high. Flowers greenish-yellow, spotted. Leaves pubescent.—Resembles the preceding.

4. C. spectabile Swartz: stem leafy; lobe of the style elliptic-cordate, obtuse; outer segments of the perianth broad-oval, obtuse; lip cleft before, longer than the perianth.—C. canadense Mich.

HAB. Swamps and bogs. Can. to Car. May, June. 21.—Stem 2-3 feet high. Leaves ovate-lanceolate, plaited, exactly resembling those of Veratrum riride. Flowers 2-3, very large. Lip white, variegated with stripes of purple.

5. C. acaule Ait: scape leafless, 1-flowered; radical leaves 2, oblong, obtuse; lobe of the style roundish-rhomboidal, acuminate deflexed; segments of the perianth lanceolate; lip shorter than the segments, cleft before.—C. humile Swartz.

HAB. Shady woods. Subarc. Amer. to Car. May, June. 24.
—Scape a foot high. Flower very large; lip purple.

* ARIETINUM. Lip inflated, acute. Lower segments of the perianth not united, (or 5 segments distinct.)

A. americanum Beck: stem leafy; lobe of the style orbicular; the two lower segments linear-lanceolate, deflexed; two lateral linear, spreading; upper one oblong-ovate, acute; lip as long as the seg-

ments, inversely conical.—Cypripedium arictinum Ait.

Hab. Sphagnous swamps. Montreal, U. C. Fairhaven, Ver. Hallowell, Maine; rare. 24.—Stem 6—8 inches high, with few alternate lanceolate leaves. Flowers much smaller than in any of the preceding. Flowers greenish-brown. Lip small, acute, reticulated.—I know not, but in the recent divisions of the Orchideous genera, this plant may have been separated from Cypripedium; if it has not, it certainly should be, as it is so very different from all the species of that genus. This suggestion was first made by Dr. Bigelow in his Florula Bostoniensis, and I have ventured to propose the above name, which alludes to the resemblance of the shape of the flower to a ram's head.

ORDER CXVII. IRIDEÆ. Juss. Lind.

Perianth tubular, 6-parted, in two often unequal rows. Stamens 3, distinct or monadelphous, opposite the outer segments of the perianth; anthers 2-celled, bursting outwardly. Ovary 3-celled, cohering with the tube of the perianth; ovules numerous; style 1; stigmas 3, dilated, often petaloid, and sometimes 2-lipped. Capsule 3-celled, 3-valved, with a locu-

licidal dehiscence. Seeds numerous; embryo cylindrical; enclosed within a fleshy or horny albumen; radicle pointing to the hilum.

Herbs, rarely undershrubs. Leaves equitant, distichous. Flowers with spataceous bracts.

1. IRIS. Linn.

Perianth 6-cleft; 3 of the segments larger and reflexed, the others erect. Stamens distinct. Style short or none. Stigmas 3, petaloid, covering the stamens.

Triandria. Monogynia.

1. In versicolor Linn.: stem terete, more or less flexuous; leaves

ensiform; perianth beardless; germ somewhat triangular.

a. sulcata Torr.: stem slightly compressed; inner segments of the perianth longer than the stigmas; germ with the angles sulcate, the sides concave; capsule, oblong, ventricose; angles indistinctly furrowed.

b. communis Torr.: stem erect, distinctly flexuous; leaves narrowensiform; inner segments of the perianth a little shorter than the stigmas; angles of the germ not grooved when young; side deeply concave; capsule cylindrical-oblong.

- HAR. Margins of ponds. Can. to Car. 24.—Root large, fleshy, creeping. Stem 2-3 feet high. Flowers 2-6, blue, variegated with green and yellow. Blue Flag.
- 2. I. prismatica Pursh: stem round; leaves linear, long; perianth beardless; germs triangular, twice grooved on the sides.-L. virginica Torr. not of Linn.
 - HAB. Wet meadows. N. S. June. 21.—Root fleshy, creeping. Stem 1-2 feet high, round, smooth. Leaves 1-2 an inch broad, very long and erect. Flowers 2—6 in a terminal raceme, purple and yellow. Germs with 2 parallel grooves on each side.—Very abundant in New-Jersey.
- 3. I. lacustris Nutt.: leaves ensiform, shorter than the 1-flowered scape; perianth without a bearded crest; segments nearly equal, attenuated on the tube; capsule turbinate, 3-sided, margined; root tuberous.
 - HAB. Gravelly shores of Lake Huron. Nutt. June. 21.-Root creeping. Scape compressed, scarcely an inch long. Leaves 3-5 inches long and 1-4 of an inch broad. Torr.

2. SISYRINCHIUM, Linn.

Spathe 2-leaved. Perianth 6-cleft, flat, equal. cohering below. Stigma 3-cleft. Triandria. Monogynia.

1. S. mucronatum Mich.: scape simple, winged; spathe coloured; one of the valves ending in a long rigid point.

HAB. Wet meadows. N. Y. to Vir. July. 21.-Stem 6-10 inches high, setaceous. Flowers 3 or 4 in each spathe, blue. 30*

2. S. anceps Linn.: scape simple, winged; spathe unequal, shorter than the flowers; segments mucronate.—S. gramineum Lam.

HAE. Pastures, &c. Can. to Car. July. 21.—Stem a foot high. Spathe of two lance olate nearly equal valves, not coloured as in the preceding. Flowers 3 or 4 in each spathe, blue.

Blue-eyed Grass.

ORDER CXVIII. AMARYLLIDEÆ. Brown. Lind.

Perianth petaloid, regular, 6-cleft; the outer segments overlapping the inner. Stamens 6, inserted on the perianth; anthers bursting inwardly. Ovary 3-celled, the cells many-seeded, sometimes 1—2; style 1; stigma 3-lobed. Fruit a 3-celled, 3-valved capsule, or a 1—3-seeded berry. Seeds with a thin and membranous, or thick and fleshy integument; albumen fleshy; embryo nearly straight; radicle next the hilum.

Generally bulbous, sometimes fibrous rooted. Leaves ensiform, with parallel veins.

1. AMARYLLIS. Linn.

Perianth 6-parted, petaloid, irregular. Stamens 6, arising from the orifice of the tube, declined or straight, unequal.

Hexandria. Monogynia.

A. atamasco Linn.: spathe bifid, acute; flower pedicellate; perianth subcampanulate, subequal, erect, short and tubular at the base; stamens declined, equal.

HAB. Shady woods. Penn. Muhl. S. to Car. June. 24.—
Scape 6 inches high. Leaves a foot long, linear, concave, smooth. Flower solitary, large, white and pink.

Atamasco Lilly.

ORDER CXIX. HYPOXIDEÆ. Brown. Lind.

Perianth petaloid, usually 6-parted, regular; æstivation imbricate. Stamens 6, inserted into the base of the segments. Ovary inferior, 3-celled, many-seeded; style single; stigma 3-lobed. Capsule indehiscent, sometimes succulent. Seeds numerous, with a black crustaceous integument and a rostelliform hilum; embryo in the axis of fleshy albumen.

Herbs stemless or nearly so. Leaves plaited.

*1. HYPOXIS. Linn.

Spathe 2-valved. Perianth superior, 6-parted, persistent.

Capsule elongated, narrowed at the base, 3-eelled, many-seeded. Seeds roundish, naked. Hexandria. Monogynia.

II. crecta Linn.: hairy; leaves all radical, linear and gramineous, sparingly hirsute, longer than the scape; scape 2-4-flowered; segments of the perianth lanceolate.—II. crecta and II. graminea Pursh.—II. carolinicusis Mich.

IIAB. Meadows and woods. Can to Car. June, July. 24.—
Root bulbous. Scape 4—6 inches high, with the leaves narrow
and often double the length. Flowers yellow. Star Grass.

ORDER CXX. DIOSCOREÆ. Brown, Lind.

Flowers dioecious. Perianth 6-cleft, equal. Stamens 6, inserted into the base of the segments of the perianth. Ovary 3-celled; ovules 1—2 in each cell; style deeply trifid; stigmas undivided. Fruit a thin compressed capsule, with two of its cells sometimes abortive. Seeds flat, compressed; embryo small, lying in a large cavity of a somewhat horny albumen, near the hilum.

Twining shrubs. Leaves usually alternate, mostly with reticulated veins.

1. DIOSCOREA. Linn.

Dioecious. Perianth 6-parted. Sterile Fl. Stamens 6. Fertile Fl. Styles 3. Capsule 3-celled, triangular, compressed; cells 2 seeded. Seeds membranaceously margined.

Dioecia. Hexandria.

1. D. villosa Linn.: leaves alternate, opposite and verticillate, cordate, acuminate, pubescent beneath, 9-nerved; lateral nerves simple.

—D. paniculata Mich.

HAB. Woods. Can. to Car. May, June. 21.—Stem climbing, sometimes 12 feet high. Lower leaves whorled, upper ones generally alternate. Flowers small, in axillary panicles.

Vam. Root.

-2. D. quaternata Walt.: leaves verticillate in fours, or alternate, cordate, acuminate, smooth on both sides, 7-nerved; lateral nerves bifid.

-D. glauca Muhl.

HAB. Old fields. Penn. to Car. July. 21. Stem climbing.

Leaves more tapering at the summit than in the former.

ORDER CXXI. SMILACEÆ. Brown. Lind.

Flowers monoclinous or dioeeious. Perianth petaloid, 6-parted, (4-parted in Styrandra.) Stamens 6, (4 in Styrandra.)

dra) inserted into the base of the divisions of the perianth, rarely hypogynous. Ovary 3-celled; ovules 1 or several in each cell; style usually trifid; stigmas 3. Fruit a roundish berry. Seeds with a membranaceous (not black or brittle) integument; albimen fleshy cartilaginous; embryo usually remote from the hilum.

Herbs or undershrubs usually climbing. Leaves sometimes with reticulated veins.

1. SMILAX. Linn.

Dioecious. Perianth campanulate-spreading, 6-parted. Sterile Fl. Stamens 6. Fertile Fl. Ovary 1. Styles 3. Stigmas 3. Berry globose, 3-celled.

Dioecia. Hexandria.

* Stem frutescent.

1. S. quadrangularis Willd.: prickly; stem 4-angled, unarmed above; leaves unarmed, ovate, subcordate, acute, 5-nerved.

HAB. Dry woods. Penn. to Car. June, July. 21.—Berries black. Pursh.

2. S. sarsaparilla Linn.: stem prickly, slightly 4-angled; leaves unarmed, ovate-lanceolate, cuspidate, somewhat 5-nerved, glaucous beneath: common peduncle longer than the petioles.

Hab. Swamps. Penn. to Car. June, July. 21.—Stem climbing, with scattered prickles. Flowers small. Berries black, 3-

seeded.

3. S. rotundifolia Linn.: stem prickly, nearly round; leaves unarmed, roundish-ovate, acuminate, slightly cordate, 5-nerved; berries spherical.

HAB. Moist woods. Can. to Car. June. 21.—Stem climbing upon trees and bushes, with strong tendrils. Umbels small, on short axillary peduncles. Berries black.

4. S. caduca Linn.: prickly; leaves ovate, mucronate, 5-nerved; common peduncles scarcely longer than the petioles.

Hab. Dry fields. Can. to Car. June. b.—Stem flexuous, somewhat angled. Pedicels of the flowers as long as the common peduncle.

5. S. laurifolia Linn.: prickly; branches unarmed; leaves coriaceous, oval-lanceolate, slightly acuminate, 3-nerved; umbels on very short peduncles.

HAB. Boggy woods. N. J. to Geor. June—Aug. b.—Stem climbing to a great height. Leaves somewhat crowded, coriaceous and perennial. Peduncles scarcely as long as the pedicels.

6. S. pandurata Pursh.: prickly; leaves ovate-panduriform, acuminate, 3-nerved; common peduncles twice as long as the petioles.—S. tamnoides Ell. not of Linn.?

HAB. Sandy woods. N. J. to Car. July. 5.—Stem twining, round. Leaves smooth and shining on both sides. Berries black.

7. S. pseudo-china Linn.: unarmed; leaves unarmed; cauline ones cordate; those of the branches ovate-oblong, 5-nerved; peduncles very long.

HAB. Sandy woods. N. J. to Car. May, June. 5.—Root large, tuberous. Stem climbing. Lower leaves distinctly cordate.

** Stem herbaceous, unarmed.

8. S. herbacea Linn.: stem angled, erect, simple; leaves on long petioles, oval and cordate-ovate, acuminate, nerved, pubescent beneath; the lower ones alternate; the upper ones verticillate and crowded; peduncles very long, compressed.

Hab. Woods. N. Y. to Car. June, July. 21.—Stem 2-3 feet high, with 1-2 small branches. Leaves, when young, oyal or

ovate; when old, slightly cordate. Berries black.

9. S. peduneularis Muhl.: stem round, climbing; leaves roundishovate, cordate, acuminate, 9-nerved; umbels on very long peduncles.

Hab. Low woods. Can. to Penn. June. 21.—Stem climbing by stipular tendrils, 3—5 feet high. Flowers small, greenish, in simple umbels, fetid. Peduneles 4—6 inches long.

2. STYRANDRA. Raf.

Perianth 4-parted, spreading. Stamens 4, divergent. Berry 2-celled. Tetrandria. Monogynia.

Obs. After a most careful examination of the subject, I have determined to adopt the views of Mr. Rafinesque, in regard to the Linnwan genus Conrallaria. The habit and flowers of these plants are so widely different, that it is almost impossible to present any collective characters. I am as much opposed as any one, to unnecessary division, but the very purpose of botanical arrangement is frustrated when a genus is allowed to have such an unnatural range.—See Raf. Med. Bot. ii. 84.

S. bifolia Raf.: stem 2-leaved; leaves on short petioles, cordate-oblong, very smooth on both sides; raceme simple, terminal; flowers tetrandrous.—Convallaria bifolia Linn.—Smilaeina eanadensis Pursh.—Mayanthemum canadense Desf.

HAB. Shady woods. Can. and N. S. May. 21.—Stem 4-6 inches high. Flowers white, small.—Agrees in habit with the next genus, but differs in being tetrandrous and in having a 2-

celled berry.

3. SMILACINA. Desf.

Perianth 6-parted, spreading, Stamens 6, divergent, attached to the base of the segments.

Berry globose, 3 celled.

Hexandria, Monogynia.

- 1. S. stellata Desf.: leaves numerous, alternate, oval-lanceolate, clasping; raceme simple, terminal, 3—8-flowered.—Convallaria stellata Linn.
 - HAB. River banks. Can. and N. S. May, June. 2f.—Stem a foot high. Flowers small, white, in an erect terminal raceme.
- 2. S. trifolia Desf.: stem smooth, angular, pubescent, about 3-leaved; leaves alternate, oval-lanceolate, contracted at the base; raceme simple terminal, few-flowered.—Convallaria trifolia Linn.
 - Hab. Alpine swamps. Can. and N.S. June, July. 21.—Stem 6 inches high. Flowers small, white, 4—6 in a terminal raceme, with the segments spreading.
- 3. S. racemosa Desf.: stem a little flexuous; leaves numerous, alternate, sessile, oblong-oval, acuminate, nerved, pubescent; flowers in a terminal racemose paniele, very small.—Convallaria racemosa Linn.
 - Hab. Woods. Can. to Car. W. to Miss. June, July. 21.—
 Root tuberous. Stem 1 1-2—2 feet high. Flowers very small,
 greenish-white, in a compound terminal panicle or raceme.

4. CLINTONIA. Rof.

Perianth 6-parted, campanulate. Stamens 6, inserted at the base. Style compressed. Stigma 2-lobed, compressed. Berry 2-celled; cells many-seeded. Hexandria. Monogynia.

- Obs. This genus was named by Mr. Rafinesque in honor of the late Gov. Clinton. It differs from *Dracana* in its 2-lobed stigma, and its 2-celled and many-seeded berry. From *Smilacina*, with which it was associated by Defontaines, it differs not only in the above characters, but strikingly also in habit and colour.
- 1. C. borealis Raf.: subcaulescent; leaves elliptic-obovate, with the margins ciliate; scape pubescent; umbel terminal; pedicels nodding, without bracts.—Drackua borealis Ait.—Smilaeina borealis Pursh.
 - Hab. Wet woods. Can. and N. S. May, June. 21.—Scape 6—8 inches high. Leaves radical or nearly so, 6 inches or more in length. Flowers large, campanulate. Berries oblong.
- 2. C. multiflora Raf.?: leaves radical oblong-oval, with the margin and keel ciliate; scape pubescent; umbel terminal; pedicels with minute bracts at base.—Convallaria umbellulata Mich. Torr.—Smilacina umbellulata Pursh. Ell.—Dracana borealis Big.
 - Hab. Alpine bogs. Can. to Car. May, June. 24.—Resembles the preceding, but considered distinct by Pursh and other authors. It is more common than the last. Mr. Rafinesque thinks that several distinct species are confounded under the name C. umbellulata, and I am in doubt whether this is the one which he designates by the above.

5. POLYGONATUM. Desf.

Perianth 6-cleft, cylindrical. Stamens 6, inserted on the upper part of the tube. Berry 3-celled; cells 2-seeded.

Hexandria. Monogynia.

1. P. multiflorum Desf.: stem terete, smooth; leaves alternate, clasping, oblong oval, smooth on both sides; peduncles axillary, many-flowered. - Convallaria multiflora Linn.

HAB. Rocky woods. Can. to Car. June, July. 21 .- Stem 2-3 feet high. Flowers greenish-white, 2-4 on nodding ax-Solomon's Seal.

illary peduncles.

2. P. biflorum Ell.: stem terete, smooth; leaves alternate, sessile, elliptic-lanceolate, 3-nerved; peduncles axillary, solitary, 2-flowered. -Convallaria biflora Walt. - Smilacina angustifolia Pursh.

HAB. Rocky situations. Penn. to Car. May, June. 21.-Stem 12-18 inches high. Flowers yellow, tipped with green.—Per-

haps only a variety of the preceding.

3. P. pubescens Pursh: stem nearly terete, furrowed; leaves alternate, clasping, ovate, pale and pubescent beneath; peduncles axillary, filiform, mostly 2-flowered.—Convallaria pubescens Willd.

HAB. Rocks. N. Y. to Car. May, June. 21.—Stem 18 inches high, curved. Flowers yellowish-white, much smaller than in

the preceding.

- 4. P. eanaliculatum Pursh: stem channelled; leaves alternate, clasping, oblong, pubescent on the margin; peduncles axillary, 2flowered - Convallaria canaliculata Willd.
 - HAB. Shady woods. Near Boston. Big. Penn. to Virg. Pursh. June. 21.—Distinguished from the preceding by its angular
- 5. P. latifolium Desf.: stem angular; leaves sessile, ovate, acuminate, smooth on both sides; peduncles one or many-flowered, long and recurved .- Convallaria latifolia Linn .- C. polygonatum Muhl.

Wet banks. Penn. and Vir. June. 24.-Stem 3-5 feet high.-The largest of the North American species.

6. STREPTOPUS. Mich.

Perianth 6-parted; segments with a nectariferous pore at base. Stamens 6. Anthers longer than the filaments. Stigma very short. Berry subglobose, smooth, 3-celled. Seeds Hexandria. Monogynia. few.

- 1. S. roseus Mich.: smooth and shining; stem dichotomous, terete; leaves clasping, serrulate-ciliate; anthers short, two horned. - Uvularia rosca Muhl.
 - HAB. Mountains. Can. to Car. May, June. 21.—Stem 12—18 inches high. Flowers rose coloured, on filiform axillary pedicels.
- 2. S. distortus Mich.: smooth; leaves clasping, smooth on the margin; pedicels distorted and geniculate in the middle; anthers sagittate, acuminate, much longer than the filaments. - Uvularia amplexifolia Linn.
 - HAB. Shady alpine woods. Can. and N. Y. May, June. 21.

 —Stem 2 feet high. Flavers greenish-yellow, on filiform axillary pedicels which are longer than in the preceding.

3. S. lanuginosus Mich.: hoary-pubescent; leaves sessile, subcordate at the base, acuminate; pedicels in pairs.—Uvularia lanuginosa Muhl.

HAB. Mountains. Penn. to Car. May. 21.—Flowers much larger than in the preceding species, greenish.

7. MEDEOLA. Linn.

Perianth 6-parted, revolute. Stamens 6. Stigmas 3, divaricate, united at base. Berry 3-celled; cells 3-6 seeded.

Hexandria. Trigynia.

M. virginica Linn. - Gyromia virginica Nutt.

Hab. Moist woods. Can. to Geor. May, June. 21.—Stem 12—18 inches high, erect. Leaves in 2 whorls; one about the middle of the stem of 6—8 ovate lanceolate acuminate leaves; the other near the top of 2—3 ovate ones. Flowers 3—6 on pedicels arising from the upper whorl, yellow, reflexed.

Cucumber Root.

8. TRILLIUM. Linn.

Perianth 6-parted; 3 outer segments resembling a calyx, spreading; 3 inner petaloid, (petals.) Stamens 6, inserted at the base of the segments, nearly equal. Anthers linear. Style usually none. Stigmas 3, distinct or approximate. Berry 3-celled; cells many-seeded. Hexandria. Trigynia.

* Flowers sessile.

i. T. sessile Linn.: leaves sessile, broad-ovate, acute; flowers closely sessile, erect; petals lanceolate, erect, twice as long as the calyx.

HAB. Fertile hills. Penn. to Car. Pursh. April, May. 21.
—Stem 8 inches high, smooth. Flowers dark purple.

2. T. recurvatum Beck: leaves ovate or obovate, subpetiolate, nerved; flower closely sessile; petals lanceolate-ovate, very acute, attenuate at base, erect, as long as the recurved calyx.

Hab. Shady woods. Miss. May. 21.—Stem 8—10 inches high, smooth. Leaves smooth, clouded with dark green. Corol purple. Filaments very short.—I have been led to introduce this and the next species, described some years since, (Sill. Jour. xi. 178,) from the fact that under the name T. sessile, several distinct species have heretofore been included.

3. viride Beek: leaves ovate, acute, closely sessile, 3—5-nerved; flower erect, closely sessile; petals fleshy, narrow, somewhat spatulate, a little longer than the lanceolate or ovate obtuse erect calyx.

HAB. Shady woods. Miss. April. 21.—Stem 8—12 inches high. Leaves with whitish spots on the upper surface. Petals dark green Calyx leaves variable.

** Flowers pedunculate.

4. T. erythrocarpum Mich.: peduncle somewhat erect; petals ovallanceolate, acute, recurved, nearly as long again as the narrow calyx; leaves ovate, acuminate, rounded at the base, abruptly contracted into a short petiole.—T. pictum Pursh.—T. undulatum Willd.

HAB. Shady woods. Can. to Car. May, June. 21.—Stem 6-8 inches high. Flowers white, with purple veins near the base, on peduncles about an inch long.

- 5. T. pusillum Mich.: peduncle erect; petals scarcely longer than the calyx; leaves oval oblong, obtuse, sessile.—T. pumilum Pursh.
 - HAB. Penn. Muhl. S. to Car. May. 21.—Plant small. Flow-crs flesh coloured.
- 6. T. cernum Linn.: peduncle recurved; petals lanceolate, acuminate, flat, recurved, as long as the calyx; leaves dilated-rhomboid, abruptly-acuminate, on short petioles.

Hab. Shady woods. N. Y. to Car. May. 21.—Stem 12—18 inches high. Flowers small, white. Berries large, dark purple.

7. T. crectum Linn.: peduncle inclined; flower a little nodding; petals ovate, acuminate, flat, spreading, broader but scarcely longer than the calyx; leaves broad-rhomboid, acuminate, sessile.—T. rhomboideum var. atropurpureum Mich.—T. atropurpureum Curt.

b. album Pursh: flowers smaller; petals white. - T. rhomboideum

var. album Mich.

- HAB. Shady rocks. N. Y. to Car. W. to Miss. May. 21.—Stem 12—15 inches high. Flowers dark purple or white.—Var. b. is found near this city.
- 8. T. pendulum Willd.: peduncle inclined; flower pendulous; petals ovate, acuminate, spreading, about as large as the ovate acuminate calyx; leaves round, rhomboidal, acuminate, somewhat sessile.

HAB. Mountains. Penn. to Car. May. 21.—Stem a foot high. Flower white, with pink veins.

9. T. grandiflorum Salisb.: peduncle a little inclined; flower nearly erect; petals spatulate-lanceolate, connivent at the base, much longer than the calyx; leaves broadly rhomboid-ovate, sessile, abruptly acuminate.—T. rhomboideum var. grandiflorum Mich.

Hab. Rocky banks of streams. N. Y. to Car. W. to Miss. May. 21.—Stem 8—12 inches high. Flower much larger than in any of the preceding, varying from white to rose colour.

9. UVULARIA. Linn.

Perianth inferior, 6-parted, erect; segments with a nectariferous cavity at base. Stamens 6; filaments very short, growing to the anthers. Stigmas 3, reflexed. Capsule 3-angled, 3-celled, 3-valved. Seeds many, subglobose, arillate at the hilum.

Hexandria: Monogynia.

1. U. perfoliata Linn.: leaves perfoliate, elliptic, obtuse; perianth campanulate, granular within; anthers awned.—U. perfoliata var. minor Mich.

HAB. Shady hills. Can. to Car. W. to Miss. May, June.

21.—Stem 8—12 inches high. Flowers pale yellow, few, solitary, axillary, nodding.

Bellwort.

2. U. flava Smith: leaves perfoliate, elliptic-oblong, obtuse, undulate at base; perianth tapering at base, scabrous within; anthers awned.

HAB. Sandy soils. N. J. to Car. May, June. 21.—Flowers larger and of a deeper yellow than in the preceding.—Pursh.

Perhaps only a variety.

3. U. grandiflora Smith: leaves perfoliate, oblong, acute; perianth smooth within; anthers without awns; nectaries nearly round; pistil shorter than the stamens.—U. perfoliata var. major Mich.—U. lanccolata Willd.

HAB. Rocky hills. Can. to Car. W. to Miss: May, June. 21.—Whole plant much larger than either of the preceding.

4. U. sessilifolia Linn.: stem smooth; leaves sessile, oval-lanceolate, glaucous beneath; segments of the perianth flat, smooth within; capsules ovate, peduncled.

Hab. Shady woods. Can. to Car. May. 21.—Stem 8—10 inches high, forked near the summit. Flowers 1—2 on a slender

axillary peduncle, pale yellow.

ORDER CXXII. ASPHODELEÆ. Brown. Lind.

Perianth petaloid, 6-parted, regular. Stamens 6, inserted upon the perianth, or hypogynous; 3 sometimes unlike the others or wanting. Ovary superior, 3-celled; ovules 2 or many in each cell; style 1; stigma entire or shortly 3-lobed. Fruit capsular or fleshy. Seeds with a black brittle and crustaceous integument; albumen fleshy; embryo included.

Herbs or trees with bulbous or fasciculated roots. Leaves

with parallel veins.

1: ORNITHOGALUM. Linn.

Perianth 6-parted, spreading above. Stamens 6, dilated at base, hypogynous. Hexandria. Monogynia.

O. umbellatum Linn.: corymb few-flowered; peduncles longer than the bracts; filaments subulate.

HAB. Wet meadows. N. S. May, June. 21.—Root bulbous. Leaves radical, linear. Flowers white. Introduced.

Star of Bethlehem.

2. HEMEROCALLIS. Linn.

Perianth large, persistent, campanulate, 6-cleft; tube cylindric. Stamens 6, declined. Stigma somewhat villous.

Hexandria. Monogynia.

H. fulva Linn.: leaves linear, carinate; 3 segments of the perianth obtuse and undulate; outer nerves of the segments branching.

Han. Wet meadows. Penn. July. 21.—Scape 3—4 feet high. Leaves very long. Flowers large, fulvous. Introduced.

Day Lily.

3. ALLIUM. Linn.

Flowers umbellate, terminal, arising from a 2-leaved spathe. Perianth 6-parted, generally spreading.

Hexandria. Monogynia.

- 1. A. vincale Linn.: stem slender, a little leafy; cauline leaves rounded, fistulous; umbel bulbiferous; stamens alternately tricuspidate.
 - Hab. Meadows. N. S. June, July. 21.—Stem 2 feet high. Flowers rose coloured. Introduced.
- 2. A. triflorum Raf.: scape naked, terete, shorter than the leaves; leaves lanceolate, nerved; umbel few-flowered.

HAB. Mountains. Penn. Pursh. May, June. 21.

Mountain Leeks. .

3. A. cornuum Roth: scape naked, square, umbeliferous; leaves linear, nearly flat; umbel cernuous; stamens simple; germ 6-toothed.

Hab. Banks of the Seneca Lake, N. Y. Gray. Penn. July. 21.
—Scape 1—2 feet high. Flowers rose coloured.

- 4. A. canadense Linn.: scape naked, terete; leaves linear, flat, smooth; head bearing bulbs and flowers; stamens simple, as long as the perianth.
 - HAB. Wet meadows. Can. to Car. May, June. 21.—Scape 18 inches high. Leaves very long and narrow. Flowers rose coloured.
- 5. A. tricoccum Ait.: scape naked, nearly terete; leaves lanceolateoblong, flat, smooth; umbel globose; seed solitary.

HAB. Mountain woods. Mass. to Vir. June, July. 21.—Scape a foot high. Flowers white, in a spreading umbel.

4. ASPARAGUS. Linn.

Perianth 6-parted. Stamens 6. Style very short. Stigmas 3. Berry 3-celled; cells 2-seeded.

Hexandria. Monogynia.

A. officinalis Linn.: unarmed; stem herbaceous, erect, rounded, much branched; leaves setaceous, fasciculate and flexible; peduncles jointed in the middle.

HAB. Rocky shores. N. Y. June. 21.—Stem 1—2 feet high. Flowers small, greenish-white, subaxillary, solitary, drooping. Berries scarlet. Introduced.

·5. ALETRIS. Linn.

Perianth tubular ovate, 6-cleft, rugose. Stamens 6, inserted upon the margin of the orifice. Style triquetrous, 3-parted. Capsule 3-celled, many-seeded, opening at the summit.

Hexandria. Monogynia.

1. A. farinosa Linn.: leaves radical, broad-lanceolate, smooth; flowers pedicellate, oblong-tubular; the perianth when decaying nearly smooth.—A. alba Mich.

HAB. Sandy woods. N. Eng. to Car. July. 21.—Scape 2 feet high. Flowers white, in a longitudinal spike. The root is intensely bitter. Star Grass. Colie Root.

2. A. aurea Walt.: leaves radical, lanceolate, acuminate; flowers subsessile, short, subcampanulate; perianth when decaying rugose and very scabrous.

Hab. Pine barrens. N. J. to Car. July, Aug. 21.—Scape 2-3 feet high. Flowers yellow, in a spike, not so numerous as in the preceding.

ORDER CXXIII. LILIACEÆ. Juss. Lind.

Perianth coloured, regular, 6-divided. Stamens 6, perigynous, opposite the segments of the perianth. Ovary superior, 3-celled; style 1; stigma simple, or 3-lobed. Capsule 3-celled, 3-valved, with a loculicidal dehiscence. Seeds numerous, usually flat, packed one above the other in 1 or 2 rows, with a spongy dilated integument; embryo straight, in the axis of fleshy albumen; radicle next the hilum.

Plants with scaly bulbs or arborescent stems. Leaves with parallel veins.

1. LILIUM. Linn.

Perianth campanulate, deeply 6-parted; segments straight or reflexed, with a longitudinal nectariferous line. Stamens 6. Stigma entire. Hexandria. Monogynia.

1. L. catesbæi Walt.: leaves scattered, linear-lanceolate, very acute; stem 1-flowered; perianth erect; segments with long claws, undulate on the margin, reflexed at the summit.

HAB. Sandy meadows. Penn. to Car. W. to Miss. June—Aug. 21.—Stem 18 inches high. Flowers large, scarlet, spotted with yellow and brown.

2. L. philadelphicum Linn.: leaves whorled, linear-lanceolate; stem 1—2-flowered; perianth erect, campanulate, spreading; segments with claws.

- HAB. Woods and meadows. Can. to Car. July, Aug. 21.—
 Stem 18 inches high. Flowers large, dark orange, spotted at
 base.
- 3. L. canadense Linn.: leaves remotely whorled, lanceolate, 3-nerved; nerves hairy beneath; pedancles terminal, long, generally by threes; flowers nodding; perianth turbinate, campanulate, slightly revolute; segments lanceolate.

HAB. Wet meadows. Can. to Car. W. to Miss. July; Aug. 21.—Stem 2—3 feet high. Flowers yellow, spotted on the inside.

Common Yellow Lily.

4. L. saperbum Linn.: leaves whorled, linear-lanceolate, 3-nerved, smooth, the upper ones scattered; flowers in a pyramidal raceme, reflexed; segments revolute.

Hab. Wet meadows. Can. to Car. July. 21.—Stem 4—6 feet high. Flowers 3—20 or more in a large pyramidal raceme, orange, with dark spots.—Is not this a mere luxuriant variety of the last?

Superb Lily.

2. ERYTHRONIUM. Linn.

Perianth campanulate, 6-parted; segments reflexed; the 3 inner ones with a callous tooth on each side near the base, and a nectariferous pore. Stamens 6. Capsule substipitate. Seeds ovate. Hexandria. Monogynia.

- 1. E. americanum Smith: leaves lanceolate, punctate; segments of the perianth oblong-lanceolate, obtuse at the point; inner ones bidentate near the base; style clavate; stigma entire.—E. lanceolatum Pursh.—E. dens canis Mich.
 - Hab. Wet meadows. Can. to Geor. April, May. 21.—Scape 6—8 inches high. Leaves 2, radical. Flower solitary, terminal, yellow.

 Dogtoothed Violet.
- 2. E. albidum Nutt.: leaves elliptical-lanceolate, not punctate; segments of the perianth linear-lanceolate, obtuse; inner ones without dentures, subunguiculate; style filiform; stigma 3-cleft; lobes reflexed.
 - Hab. Wet meadows. Can. and N. Y. W. to Miss. April, May. 21.—Scape 6 inches high. Flower white, segments thick and somewhat obtuse.—Very abundant near Albany, N. Y., and also found in Canada by D. Thomas, Esq. I have observed a plant at New-Brunswick, N. J. which agrees with this in the absence of dentures and in the trifid stigma, but the perianth is yellow. It is probably the same which is alluded to by Mr. Nuttall, (Gen. Pl. i. 223,) and may prove distinct.

White Erythronium.

3. E. bracteatum Rig.: leaves lanceolate, unequal; scape bracted.

H.B. High mountains. Ver. June. 21.—Leaves very unequal, one being two or three times as large as the other. Scape shorter than the leaves, with a narrow lanceolate bract 1—2 inches below the flower, which is yellow, half as large as in No. 1; the segments gibbous at base.

ORDER CXXIV. MELANTHACEÆ. Brown. Lind.

. Perianth petaloid, 6-divided, the margin of the segments, generally involute in estivation. Stamens 6; anthers usually bursting outwards. Ovary 3-celled, many-seeded; style trifid or 3-parted; stigmas three, undivided. Capsule generally divisible into three pieces, sometimes with a loculicidal dehiscence. Seeds with a membranous integument; albumen dense, fleshy.

Leaves sheathing at base, with parallel veins.

1. MELANTHIUM. Linn.

Polygamous. Perianth rotate, 6-parted; segments unguiculate, biglandular at the base, claws staminiferous. Capsule exserted, subovate; apex partly trifid, 3-celled. Seeds many, membranously winged. Hexandria. Trigynia.

1. M. virginicum Linn.: leaves long, linear-lanceolate, flat, smooth; panicle very large, pyramidal; petals ovate, somewhat hastate, flat; flowers mostly perfect.

Hab. Wet meadows. N. Y. to Car. July. 21.—Stem 3-4 feet high, leafy. Flowers greenish-white, in a panicle a foot or more in length.—This species has been found by Dr. Horton, in Orange county, N. Y.

2. M. glaucum Nutt.: root a tunicated bulb; leaves glaucous, gramineous, margined; raceme mostly simple, few-flowered; flowers perfect; segments of the perianth roundish, clawed, with 2 spots; seeds subulately winged.

Hab. Shores of Lake Eric. W. to Miss. Nutt. July, Aug. 24.
—Stem a foot high. Flowers whitish, in a raceme, which is

sometimes a little divided at base.

3. M. hybridum Walt.: leaves long-linear, nearly smooth, embracing the stem; panicle long, composed of simple racemes; segments of the perianth orbicular, plaited, with long claws; glands united.—M. racemosum Mich.

Hab. Penn. Muhl. S. to Car. June, July. 21.—Stem 2 feet high, leafy. Flowers in a long panicle, which is composed of simple racemes.

2. TOFIELDIA. Huds.

Perianth 6-parted, with a small 3-parted involucre. Stamens 6, smooth. Capsule 3-6-celled; cells many-seeded, united at base. Hexandria. Monogynia.

T. pubescens Pursh: leaves subradical, narrow-ensiform, smooth; rachis and pedicels scabrous; spike oblong, interrupted; capsule sub-

globose, scarcely longer than the involucre. — Narthecium pubens Mich. Melanthium racemosum Walt.

HAB. Swamps. Del. to Car. July. 21.—Scape 18 inches high.

Leaves a foot long. Flowers greenish-white, in a racemed spike.

3. XEROPHYLLUM. Mich.

Perianth subrotate, deeply 6-parted. Stamens 6, contiguous at base. Stigmas 3, revolute, partly united below. Capsule subglobose, 3-celled; cells 2-seeded, opening at the summit.

Hexandria. Trigynia.

X. setifolium Mich: leaves subulate-setaceous; flowers in a crowded oblong raceme; filaments dilated at the base, as long as the perianth.—Helonias asphodeloides Linn.

Hab. Sandy plains. N. J. to Car. June. 21.—Scape 3—5 feet high. Radical leaves forming large tufts a foot long and very narrow. Flowers white, in a large terminal raceme.

4. HELONIAS. Linn.

Perianth 6-parted, spreading; segments sessile and without glands. Stamens 6. Styles 3, distinct. Capsule 3-celled, 3-horned; cells few-seeded. Hexandria. Trigynia.

1. H. latifolia Mich.: scape leafless; spike ovate, crowded; bracts linear-lanceolate; leaves lanceolate, mucronate, nerved.—H. bullata Linn.

HAB. Sandy swamps. N. J. to Vir. Pursh. May. 21.—Flowers pale purple. Anthers blue.

- 2. H. crythrosperma Mich.: scape simple, leafy; leaves linear, very long, nerved; raceme oblong; bracts short; capsule shortened, with divaricate horns; seeds ovate, red.—Melanthium latum Ait.—M. muscatoxicum Walt.
 - Hab. Shady woods. Penn to Car. June, July. 21.—Stem 2 feet high. Leaves very long and linear. Flowers white, in a simple terminal raceme.
- 3. H. angustifolia Mich.: scape leafy; leaves very long and narrow, linear, subulate; raceme oblong, lax; capsule oblong, with the summit appressed; seeds linear.

HAB. N. Y. Muhl. S. to Car. June. 21.—Stem 2 feet high, smooth. Leaves narrower than in the preceding. Flowers in a simple terminal raceme.

4. II. dioica Pursh: scape leafy; leaves lanceolate; racemes dioecious, spiked, cernuous; pedicels very short, without bracts; segments of the perianth linear; stamens exserted.—H. lutca Ait.—Veratrum luteum Linn.—Melanthium dioicum Walt.

Hab. Damp grounds. N. J. to Geor. W. to Miss. June. 21.
—Stem 1-2 feet high. Leaves becoming broader near the root.

Flowers white, dioecious and polygamous, in a terminal spiked raceme.—It is doubtful whether it belongs to this genus.

Unicorn Plant.

5. VERATRUM. Linn,

Perianth 6-parted, spreading; segments sessile and without glands. Stamens 6, inserted upon the receptacle. Ovaries united at base, sometimes abortive. Styles 3, short. Capsule oblong, 2-valved, many-seeded. Seed with a membranaceous margin.

Hexandria. Trigynia.

V. viride Ait.: racemes paniculate; bracts of the branches oblong-lanceolate; partial ones longer than the subpubescent peduncles; leaves broad-ovate, plaited lengthwise.—V. album Mich.

HAB. Meadows and swamps. Can. to Car. June, July. 21.—
Stem 3—5 feet high. Leaves large, sheathing the stem at base.
Flowers greenish, in a large terminal panicle. Medicinal and poisonous.

Poke Root. American Hellebore.

ORDER CXXV. PONTEDEREÆ. Kunth. Lind.

Perianth tubular, coloured, 6-parted, more or less irregular; æstivation circinate. Stamens 3 or 6, unequal, perigynous. Ovary free, or sometimes coherent at base, 3- (or rarely 1-) celled, 3-valved, with loculicidal dehiscence. Seeds indefinite, attached to a central axis; hilum small; embryo straight, in the axis of somewhat mealy albumeu.

Aquatic or marsh plants. Leaves sheathing at the base, with parallel veins.

1. PONTEDERIA. Linn.

Perianth inferior, 6-parted, bilabiate; under side of the tube perforated with 3 longitudinal foramina, the lower part persistent, calicine. Stamens 6, unequally inserted, 3 of them upon the summit. Utricle muricate, 1-seeded.

Hexandria. Monogynia.

1. P. cordata Linn.: leaves subradical, oblong-cordate; flowers in crowded spikes; segments of the perianth oblong.

Hab. Ponds. Can. to Car. Aug. 21.—Scape 1—2 feet long. Flowers aggregated by twos and threes, sessile, bright blue.

Pickerel Weed.

2. P. angustifolia Pursh: leaves elongated-triangular, truncate and subcordate at the base; segments of the perianth linear-lanceolate.—
P. cordata var. angustifolia Torr.—P. mucronata Raf.

HAB. High mountain lakes. N. Y. to Car. Pursh. July. 21.

Flowers blue, smaller than in the preceding species, of which it may be only a variety.—I have fine specimens collected by Dr. S. B. Mead in Westchester co. N. Y.

2. HETERANTHERA. R. & P.

Flowers in a spathe. Perianth with a long and slender tube; border 6-parted, equal. Stamens 3. Anthers of 2 forms. Capsule 3-celled, many-seeded, opening at the angles; dissepiment contrary. Triandria. Monogynia.

H. reniformis R. & P.: leaves orbicular-reniform; spathe oblong, acuminate, 3—5-flowered.—II. acuta Pursh.—Leptanthus reniformis Mich.

IIAB. Overflowed banks. N. Y. to Vir. July, Aug. 21.— Stem partly floating. Leaves petioled. Flowers white.

3. SCHOLLERA. Schreb.

Spathe 1-flowered. Perianth with a very long tube; limb deeply 6-parted. Anthers of 2 forms. Capsule 1-celled.

Triandria. Monogynia.

S. graminea Vahl.—Leptanthus gramineus Mich.—Heteranthera graminea Pursh.

Hab. In flowing streams. N. S. July, Aug. 24.—Stem slender, er, dichotomous. Leaves sessile, narrow-linear. Flowers small, yellow, solitary. Stamens 4, 1 abortive.

ORDER CXXVI. RESTIACEÆ. Brown. Lind.

Perianth 2—6-parted, sometimes wanting. Stamens definite, 1—6; when half as many as the segments of the perianth, they are opposite the inner divisions; anthers mostly 1-celled. Ovary 1 or more celled. Fruit capsular or nucamentous: Seeds pendulous; embryo lenticular, on the outside of a mealy albumen, at the extremity remote from the hilum.

Herbs or undershrubs. Leaves simple, narrow, or none.

1. ERIOCAULON. Linn.

Flowers monoecious, collected into a compact scaly head.

Sterile Fl. in the disk. Perianth 4-cleft; the 2 inner segments united nearly to their summit. Stamens 4-6. Fertile Fl. in the margin. Perianth deeply 4-parted. Style

1. Stigmas 2-3. Capsule 2-3-lobed, 2-3-celled; cells
1-seeded. Monoecia. Tetrandria.

1. E. pellucidum Mich.: scape very slender, about 7-furrowed; leaves

linear-subulate, channelled, smooth, pellucid, 5-nerved, transversely striate; head small, globose; scales of the involucre oval, obtuse.

HAB. In ponds. Can. and N. S. Aug. 21.—Scape 4—8 inches high, very slender. Flowers white. Pipewort.

2. E. decangulare Mich.: scape 10-furrowed; leaves ensiform, smooth; head large, depressed-globose; scales of the involucre oval, acute, of the receptacle mucronate.

HAB. Ponds. N. J. to Car. Aug. 21.—Scape 2-3 feet high.

Flowers very white.

ORDER CXXVII. XYRIDEÆ. Kunth. Lind.

Perianth 6-parted, in 2 rows; outer glumaceous; inner petaloid, unguiculate. Stamens 6, 3 fertile inserted upon the apex of the claw of the segments of the inner row of the perianth; anthers bursting outwardly. Ovary single; style trifid; stigmas obtuse, multifid or undivided. Capsule 1-celled, 3-valved, many-seeded, with parietal placentæ. Seeds numerous; embryo on the outside of the albumen at the extremity remote from the hilum.

Herbs with fibrous roots. Leaves radical, with dilated sca-

rious bases.

1. XYRIS. Linn.

Flowers in an ovate cylindric head. Perianth 6-parted, in 2 rows; outer glumaceous, 3-valved cartilaginous; inner equal. Stigma 3-cleft. Triandria. Monogynia.

1. X. caroliniana Walt.: leaves linear, grass like; scape 2-edged; head ovate, rather acute; scales round.—H. jupacai Mich.—H. flexuosa Ell.

Hab. Wet meadows. N. Y. to Flor. July. 21.—Stem a foot high, a little twisted. Leaves sometimes spiral. Flowers yellow, in a small head.—Very variable. Yellow-cycd Grass.

2. X. brevifolia Mich.: leaves subulate, ensiform, short; head nearly globose; inner valve of the glume shorter than the outer one, slightly notched.

HAB. Wet meadows. Penn. to Geor. July. 21.—Scape 12-18 inches high, compressed near the summit. Leaves much twist-

ed. Flowers vellow.

ORDER CXXVIII. JUNCEÆ. Juss. Lind.

Flowers monoclinous or diclinous. Perianth 6-parted, more or less glumaceous. Stamens 6, inserted into the base of the segments; sometimes only 3 and opposite the outer

series; anthers 2-celled. Ovary 1—3-celled, 1- or many-seeded, or 1-celled and 3-seeded; style 1; stigmas mostly 3, sometimes only 1. Fruit capsular, 3-valved, loculicide, sometimes indehiscent. Seeds with an integument neither black nor crustaceous; albumen firm, fleshy or cartilaginous; embryo within it.

Herbs with fascicled or fibrous roots. Leaves fistular, or

flat and channelled, with parallel veins.

1. JUNCUS. Linn.

Perianth 6-parted, glumaceous. Stamens 6. Capsule 3-celled, 3-valved; valves bearing the partitions down the middle, to which the numerous seeds are fixed.

Hexandria, Monogynia.

* Leaves none.

- 1. J. acutus Linn.: seape naked, terete; involuere 2-leaved, erect, spinous; eapsule nearly round, mueronate, as long again as the perianth.
 - Hab. Sandy sea coast. N. J. to Car. July. 21.—Scape 2 or 3 feet high. Panicles 2-3 inches long, appearing as if lateral, though really terminal.
- 2. J. effusus Linn.: seape not rigid, finely striated; paniele loose, very much branched, spreading; capsule obovate, obtuse, shorter than the lanceolate acute leaves of the perianth.

HAB. Wet grounds. Can. to Car. June, July. 21.—Scape 2-3 feet high, erect. Stamens 3.

3. J. sctaccus Rosth.: scape filiform, striate; umbel lateral, compound, few-flowered; peduneles many-flowered; leafets of the perianth subulate.—J. filiformis Mich.

HAB. Swamps. Can. to Car. July. 21.—Scape 2—3 feet high, very slender. Paniele small, some distance below the summit

of the seape.

** Leaves all radical. (Flowers terminal.)

4. J. sqarrosus Linn.: leaves setaceous, rigid, grooved; panicle terminal, clongated, compound; capsule elliptical-ovate.

HAB. N. Y. Muhl. 24.—Whole plant very rigid, 6—12 inches high.

5. J. nodosus Linn.: stem somewhat leafy; leaves nodose-articulate; heads mostly 2, globose, one of them lateral and pedunculate, the other sessile; leafets of the perianth mucronate, shorter than the 3-sided acuminate capsule.

HAB. Swamps. Can. to Car. July, Aug. 21.—Stem 8—12 inches high, filiform. Leaves few and very slender.

6. J. tenuis Willd.: stem leafy, simple, nearly terete; leaves setaceous, channelled; flowers approximate, subsessile; perianth longer than the obtuse capsule.—J. bicornis Mich.

Hab. Low grounds. Penn to Car. June, July. 21.—Stem 10 inches high, often naked. Paniele terminal, often proliferous.

with a long leafy involucre.

*** Stems leafy.

† Leaves nearly plane, channelled above.

- 7. J. bulbosus Linn.: stem simple, leafy, compressed; leaves mostly radical, linear-setaceous, grooved; panicle terminal, compound, subcymose, shorter than the involucre; leafets of the perianth incurved, obtuse or acute, mostly shorter than the roundish ovate capsule.—J. dichotomus Ell.
 - Hab. Salt marshes. N. Y. to Car. Aug. 21.—Stem 8—12 inches high. Paniele small, terminal, dichotomous.
- 8. J. bufonius Linn.: stem with a dichotomous panicle; leaves filiform-setaceous, grooved; flowers subsolitary, sessile, unilateral; leafets of the perianth very acuminate, much longer than elliptical-ovate capsule.

HAB. Moist places. Can. to Car. Aug. . Stem 3-6 inches high, divided towards the top. Panicle loose, few-flow-

erea.

9. J. marginatus Rostk.: stem compressed; leaves flat, smooth; coryinb terminal, simple, proliferous; heads 5—10-flowered; flowers triandrous; leafets of the perianth about as long as the obtuse capsule; the outer ones and the bracts subaristate.—J. aristulatus Mich,—J. triglumis Walt.

b. odoratus Torr.: stem tall, subterete, leafy; panicle much branch-

ed, proliferous.

- HAB. Low grounds. N. Y. to Car. Aug. 21.—Stem 1—3 feet
 high.—Var. b. has an odorous smell—found in moist-woods near
 New-York.
- 10. J. trifidus Linn.: leaf mostly solitary near the summit, linear-setaceous; sheaths ciliate; bracts foliaceous, very long, grooved; heads about 3-flowered, terminal.
 - Hab. White Hills, N. H. Big. July. 21.—Stem 6 inches high. Flowers in a single head supported by long bracts or terminal leaves.
- 11. J. militaris Big.: leaf one, jointed, longer than the stem; panicle terminal, proliferous, with sheathing lanceolate bracts at base; heads about 5-flowered.
 - Hab. Ponds near Boston. Big.—Stem 2—3 feet high, with a long sheath or two at base and commonly another above the leaf. Panicle terminal, erect, with proliferous branches.
 - †† Leaves rounded or subcompressed, nodose-articulate.
 - 12. J. acuminatus Mich.: stem leafy, erect; leaves terete, with knot-

like joints; panicle terminal, compound; heads 3—6-flowered, pedunculate and sessile; leafets of the perianth linear-lanceolate, mucronate, shorter than the acute capsule.—J. sylvaticus Muhl.

HAB. Bogs. N. Eng. to Car. July. 24.—Stem 12—18 inches high. Leaves few, shorter than the stem.

- 13. J. polycephalus Mich.: stem leafy, erect; leaves compressed, with knot-like joints; paniele decompound; heads globose, many-flowered; flowers triandrous; leafets of the perianth somewhat awned, rather shorter than the triquetrous acute capsule.—J. echinatus Muhl.
 - Han. Boggy meadows. Penn. to Geor. July, Aug. 21.—Stem 2—3 feet high, compressed near the base. Panicle compound.
- 14. J. subverticillatus Willd.: stem leaves subulate, with knot-like joints; panicle corymbose; heads about 5-flowered, fasciculate-verticillate; leafets of the perianth striate, as long as the obtuse capsule.—
 J. fluitans Mich.—J. verticillatus Pursh.

HAB. Ponds, &c. Can. and N. S. Pursh. July, Aug. 24.— Stem 18 inches high, compressed. Paniele subverticillate.

2. LUZULA. De Cand.

Perianth 6-parted, glumaceous. Stamens 6. Capsule 3-celled, 3-valved; valves without partitions; 1 seed in each cell, fixed to the bottom.—Leaves plane, generally hairy.

Hexandria. Monogynia.

1. L. pilosa Willd.: leaves hairy; panicle subcymose; peduncles I-flowered, reflexed; leafets of the perianth acuminate, shorter than the obtuse capsule.—Juncus pilosus Linn.

HAB. Woods. N. S. April, May. 21.—Stem 6—12 inches high. Radical teaves numerous, very hairy. Paniete 8—10-

flowcred.

2. L. campestris De Cand.: leaves hairy; spikes sessile and peduncled; leafets of the perianth acuminate, awned, longer than the obtuse capsule.—Juncus campestris Linn.

Hab. Meadows. Can. to Car. April, May. 21.—Stem 6-12 inches high, cespitose at base. Panicle terminal, somewhat

umbelled.

3. L. melanocarpa Desv.: culm leafy; leaves sublanceolate, smooth; panicles capillary, loose; flowers distinctly pedicellate; capsule black.

Juncus melanocarpus Mich.

HAB. White Hills, N. H. July. Big. Can. Mich.

4. L. spicata De Cand.: leaves narrow, hairy at the throat; spike cernuous, compound; leafets of the perianth acuminate, awned, about the length of the roundish capsule.—Juncus spicatus Willd.

HAB. White Hills, N. H. Big. Aug. 24 .- Stem a span high,

slender, with an oblong nodding head.

3. NARTHECIUM. Linn.

Perianth 6-parted, coloured. Stanens 6; filaments hairy.

Seeds numerous, ovate-oblong, appendiculate at each extremity.

Hexandria. Monogynia.

N. americanum Ker.: raceme sometimes interruptedly spiked, lax; pedicels with a setaceous bract below the flower, and another embracing its base; filaments with very short hair.—Phalangium ossifragum Muhl.

Hab. Sandy swamps. N. S. June, July. 21.—Scape a foot high. Leaves narrow-ensiform. Flowers yellow, in a terminal spike.

ORDER CXXIX. HÆMODORACEÆ. Brown, Lind,

Perianth petaloid, 6-cleft. Stamens inserted on the perianth, either 3 and opposite the inner segments, or 6; anthers bursting inwardly. Ovary with the cells 1-2- or many-seeded; style simple; stigma undivided. Fruit capsular, 3-valved, seldom indehiscent, somewhat nucamentaceous. Seeds definite and peltate or indefinite; testa papery; embryo minute, in farinaceous albumen; radicle next the hilum.

Leaves equitant or arranged spirally or alternately.

1. LACHNANTHES. Ell.

Perianth superior, 6-parted; segments unequal. Stamens 3. Style declining. Stigma minutely 3-lobed. Capsule 3-celled, truncated, many-seeded. Triandria. Monogynia.

L. tinetoria Ell.—Dilatris tinetoria Pursh.

Hab. Sandy swamps. N. J. to Flor. July. 21.—Stem erect, 2 feet high, hairy at the top. Leaves ensiform, shorter than the stem. Flowers in a corymbose panicle, woolly, yellow within.

Red Root.

2. LOPHIOLA, Ker.

Perianth 6-parted, woolly, bearded inside. Stamens 6. Filaments naked. Anthers erect. Stigma undivided. Capsule opening at the summit. Hexandria. Monogynia.

L. aurea Ker.—Conostylis americana Pursh.—Helonias tomentosa Muhl.

Hab. Sandy swamps. N. J. to Car. July. 21.—Root cresping.

Leaves radical, gramineous, ensiform, shorter than the scape.

Scape erect, with 1 or 2 short leaves. Flowers yellow, in a crowded corymb.

ORDER CXXX. BROMELIACEÆ. Juss. Lind.

Perianth tubular, 6-cleft, in 2 rows; outer persistent; inner petaloid, withering or deciduous. Stamens 6, inserted into the base of the segments of the perianth. Ovary free or somewhat cohering, 3-celled; style single; stigma 3-parted, often twisted. Fruit capsular or succulent, 3-celled. Seeds indefinite; embryo cylindrical, recurved, lying in the base of mealy albumen.

Stemless or short-stemmed plants. Leaves rigid, channelled,

often thorny or toothed at the margin.

1. AGAVE. Linn.

Perianth tubular, funncl-form, adhering to the ovary, 6-parted. Stamens 6, exserted. Anthers versatile. Capsule ovate, attenuate at each end, obtusely triangular, 3-celled, many-seeded.

Hexandria. Monogynia.

A. virginica Linn.: stemless, herbaceous; leaves with cartilaginous serratures; scape simple; flowers sessile.

Hab. Rocky banks. Penn. to Car. Sept. 21.—Scape 6 feet high. Flowers greenish-yellow, very fragrant. False Aloc.

ORDER CXXXI. COMMELINEÆ. Brown. Lind.

Perianth in 2 rows; outer herbaceous, 3-parted; inner petaloid, 3-parted or trifid. Stamens 6 or fewer, hypogynous, some of them either deformed or abortive. Ovary 3-celled; cells few-seeded; style 1; stigma 1. Capsule 2—3-celled, 2—3-valved, loculicide. Seeds often in pairs in each cell; hilum usually linear and lateral; albumen densely fleshy; embryo pully-shaped, lying in a cavity of the albumen, and at the opposite extremity from the hilum.

Herbs. Leaves usually sheathing at the base.

1. COMMELINA. Linn.

Perianth in 2 rows; outer one 3-parted, calycine; inner 3-parted, petaloid. Stamens 6, 3—4 sterile and furnished with cruciform glands. Capsule 3-celled, 3-valved; one of the valves often abortive. Triandria. Monogynia:

1. C. angustifolia Mich.: assurgent; slender; inner segments of the perianth unequal, (one very minute); leaves linear-lanceolate; sheaths ciliate; bracts peduncled, short-cordate.—C. erecta Willd.

Hab. Sandy soils. N. Y. to Car. June. 21.—Stem a foot high, procumbent and erect. Flowers blue. Fertile stamens 2.

Day Flower.

2. C. rirginica Linn: inner segments of the perianth nearly equal; leaves lanceolate, somewhat petiolate, with the throat bearded; stem erect.—C. longifolia Mich.

HAB. Woods. Penn. Muhl. S. to Car. July. 21.—Stem 2 feet high. Flowers blue, clustered at the top of the stem. Fer-

tile stamens 3.

2. TRADESCANTIA. Linn.

Perianth in 2 rows; outer one 3-parted; inner one 3-parted petaloid. Filaments 6, villous. Capsule superior, 3-celled, many-seeded. Hexandria. Monogynia.

1. T. virginica Linn.: stem erect, branching, smooth; leaves long, lanceolate, smooth; flowers in an imperfect umbel, sessile, pubescent.—T. cristata Walt.

Hab. Shady woods. Penn. to Car. W. to Miss. May. 21.—
Stem a foot high. Flowers purple, in terminal compound clusters or umbels, with a large 2-leaved involucre at base.

Spider Wort.

2. T. rosea Mich.: erect, simple; leaves linear, long, smooth; peduncles elongated; calyx smooth.—T. rirginiea Walt.

HAB. Moist woods. Penn. to Geor. May. 21.—Stem 8—12 inches high. Flowers smaller than in preceding, with the inner segments rose coloured, and three times as long as the outer ones.

ORDER CXXXII. ALISMACEÆ. Brown. Lind.

Perianth 6-parted, in two rows; outer herbaceous, inner petaloid. Stamens definite or indefinite, hypogynous. Ovaries of several 1-celled carpels; ovules erect or ascending, solitary or in pairs, at a distance from each other; styles and stigmas several. Fruit dry, not opening, 1 or 2-seeded. Seeds without albumen; embryo shaped like a horse-shoe; radicle next the hilum.

Floating plants. Leaves with parallel veins.

1. SAGITTARIA. Linn.

Monoecious. Perianth 6-parted; 3 outer segments persistent calycine; 3 inner coloured, petaloid. Sterile Fl. Stamens about 24. Fertile Fl. Ovaries numerous. Capsules compressed, margined, 1-seeded.

Monoecia. Polyandria.

- 1. S. sagittifolia Willd.: leaves sagittate, acute; lobes acute, straight, lanccolate.
 - a. latifolia Torr.: leaves broad ovate, rather obtuse; lobes ovate, slightly acuminate, straight.—S. latifolia Pursh.
 - b. hastata Torr.: leaves oblong-lanceolate, acute; lobes spreading, lanceolate, long, acuminate; flowers mostly dioecious.— S. hastata Pursh.
 - c. gracilis Torr.: leaves linear; lobes much spreading, linear, very long and acute.—S. gracilis Pursh.
 - d. pubescens Torr.: leaves and stem pubescent; bracts and calyx very pubescent.—S. pubescens Muhl.
 - HAR. Ponds. Can. to Car. July, Aug. 21.—Scape 1—2 feet high. Leaves large. Flowers white, whorled in threes.—The above account of this species which is from Torrey's Compendium, will show the very variable character of the plant.

Arrow-head.

- 2. S. obtusa Willd.: leaves sagittate, dilated-ovate, rounded at the the extremity, mucronate; lobes approximate, oblong, obliquely acuminate, straight; flowers dioecious; sterile scape branched at base.
 - HAB. Ditches and ponds. Penn. to Vir. July. 21.—Leaves the size of Calla palustris. Flowers white.—The plant affords a milky sap which hardens into a white and hyaline gum, Nutt.
- 3. S. heterophylla Pursh: leaves simple, linear and lanceolate, acute at each end, or elliptical and sagittate, with the lobes linear and divaricate; scape simple, few-flowered; flowers monoecious, the fertile subsessile; bracts short, suborbiculate,
 - Hab. Bogs and ditches. Penn. to Vir. July. 2f.—Scape a foot high. Leaves 2 1-2 inches long.—The species is easily distinguished by its fertile flowers being sessile.
- 4. S. rigida Parsh: lcaves narrow-lanceolate, carinate below, rigid, very acute at each end; scape branched; flowers monoecious.
 - Hab. Deep water near Oswego Falls, N. Y. July, Aug. Pursh. 21.—Grows in a depth of more than 7 feet water. Petioles strong and stiff. Flowers very numerous.
- 5. S. simplex Pursh: leaves linear-lanceolate, acute, narrowed towards the base; scape simple, many-flowered; flowers dioecious; bracts and calyx obtuse and rounded.
 - HAB. Ponds. N. J. Aug. 21.—Scape 8—12 inches high. Leaves 6 inches long, 1-2 an inch wide. Flowers small, 12—18 in a scape.
- 6. S. acutifolia Pursh: leaves acutely subulate, sheathing at base, convex on the back; scape simple, few-flowered; flowers monoecious; bracts dilated, acuminate.
 - HAB. Muddy shores. Mass. N. Y. and Penn. July, Aug. 21.
 —Seape 6 inches high. Flowers pedunculate.—Found by Dr. Bigelow near Boston, and by Dr. S. B. Mead at Peekskill, N. Y.
- 7. S. pusilla Nutt.: leaves linear, obtuse and short, the summits foliaceous; scape simple, shorter than the leaves; flowers monoecious,

few; fertile one solitary, deflexed; stamens mostly 7.—Alisma subulata Pursh.

Hab. Muddy banks. Penn. to Geor. Aug. 21.—Scape 2-4 inches high. Leaves rarely ever subulate, searcely a line wide, and obtuse. Sterile Flowers 3-6. Fertile 1, recurved.

8. S. natans Mich.: leaves floating, elliptic-lanceolate, obtuse, 3-nerved, attenuated at base; lower ones subcordate; scape simple, few-flowered; lower peduncles elongated.

Hab. In water. Muhl. S. to Car. July, Aug. 21.—Scape mostly erect, 3—6 inches long. Leaves generally floating, 1—2 inches long. Flowers few, small, the upper sterile. Ell.

2. ALISMA. Linn.

Perianth 6-parted; 3 outer segments persistent, calycine; 3 inner coloured, petaloid. Stamens 6. Ovaries and styles numerous. Capsules numerous, distinct, 1-seeded, not opening.

Hexandria. Polygynia.

A. plantago Lina.: leaves ovate-cordate, acute or obtuse, 9-nerved; flowers in a compound verticilate paniele; fruit obtusely triangular.

b. parviflora Torr.: leaves oval, 5—7-nerved, acuminate; flowers very small.—A. parviflora Pursh.

HAB. In water. Can. to Flor. July, Aug. 24.—Scape 1—2 feet high, triangular. Leaves all radical, on long petioles. Panicle much decompounded in a verticillate manner. Flowers white, tinged with purple.—Var. b. has the flowers smaller and the leaves not more than 7-nerved. It generally grows near salt water.

Water Plantain.

ORDER CXXXIII. JUNCAGINEÆ. Rich. Lind.

Perianth herbaceous, rarely wanting. Stamens 6, hypogynous. Ovary of 3 or 6 carpels, cohering firmly together; ovules 1 or 2 in each carpel, erect, approximated at the base. Fruit dry. Seeds 1—2, erect; albumen none; embryo straight; radicle at the opposite extremity from the hilum; plumule emitted through a lateral cleft in the embryo.

Herbs growing in bogs. Leaves ensiform, with parallel veins.

1. TRICHLOCHIN. Linn.

Perianth 6-leaved, deciduous; the leafets concave, 3 inner ones inserted higher up. Stamens 6, very short. Anthers with their anterior side turned outward, subsessile. Ovaries 3—6, 1-seeded. Styles short. Stigmas adnate. Capsules 3—6, valveless. Seeds erect. Hexandria. Trigynia.

- 1. T. palustre Linn.: fruit of 3 united capsules, nearly linear, attenuated at the base.
 - Hab. Marshes. Salina, N. Y. N. to Arc. Amer. July. 24.— Scape a foot long, very slender. Leaves very numerous, fleshy, nearly as long as the scape. Flowers small, greenish, in a terminal lax spike or raceme. Arrow Grass.
- 2. T. maritimum Linn.: fruit ovate-oblong, of 6 united capsules—and T. elatum Nutt.
 - IIAB. Salt marshes. Can. and N. S. W. to Mich. July. 24.
 —Scape 18 inches long, angled. Leaves all radical, narrow, sheathing at base, shorter than the scape. Flowers very small in a long terminal spike.

2. SCHEUCHZERIA. Linn.

Perianth 6-parted. Stamens 6. Anthers linear. Stigmas sessile, lateral. Ovaries 3-6. Capsules compressed, inflated, 2-valved, 1-2-seeded. Hexandria. Trigynia.

S. palustris Linn.

Hab. Sphagnous swamps. Ver. N. Y. Penn.; rare. July. 21.—Stem 8—12 inches high. Leaves linear, roundish, sheathing at base. Flowers greenish-yellow, in a small terminal raceine.

ORDER CXXXIV. TYPHACEÆ. Lind.

Flowers diclinous, arranged upon a naked spadix. Perianth 3-parted. Stamens 3 or 6; filaments long and slender; anthers wedge-shaped, erect. Ovary single, superior, 1-celled, ovule solitary, pendulous; style short; stigmas 1—2, linear, simple. Fruit dry, indehiscent, 1-celled, 1-seeded. Embryo in the centre of albumen straight, taper, with a cleft in one side, in which lies the plumule; radicle next the hilum.

Herbs growing in marshes or ditches. Stems without nodi. Leaves rigid, ensiform, with parallel voins.

1. SPARGANIUM. Linn.

Monoccious. Ament dense, sperical. Sterile Fl. Perianth 3-leaved. Fertile Fl. Perianth 3-leaved. Drupe dry, 1-seeded.

Monoccia. Triandria.

- 1. S. ramosum Smith: leaves triangular at base, their sides concave; common flower-stalk branched; stigma linear.—S. erectum Linn.
 - HAB. Stagnant waters. Can. to Vir. July, Aug. 21.—Stem 2 feet high. Leaves few, ensiform. Flowers white, in round heads.

 Burr Reed.

2. S. americanum Nutt.: lower leaves equal with or exceeding the stem, which is nearly simple; floral ones concave at base and erect: stigma always simple, ovate-oblong, oblique, scarcely more than half the length of the style. -P. simplex Pursh.?

HAB. Ponds and lakes. N. Y. to Car. Aug. 21 .- Stem a foot high, simple or divided at base. Lower leaves carinate. Fer-

tile heads 2-5, mostly sessile.

3. S. natans Smith: leaves floating, flat; common flower-stalk simple; stigma ovate, very short; head of sterile flowers subsolitary .-S. angustifolium Mich.

HAB. Lakes, &c. Can. and N. S. Aug. 21.—Stem long and slender. Leaves very long, pellucid.—Found by Mr. G. W. Clinton, in a lake on Catskill mountains.

TYPHA. Line.

Flowers collected into a long dense cylindrical spike. STE-RILE FL. Perianth none. Stamens 3, together upon a chaffy or hairy receptacle, united below into one common filament. FERTILE FL. Perianth none. Pericarp pedicellate, surrounded at base with hairs resembling a pappus.

Monoecia. Triandria.

1. T. latifolia Linn.: leaves linear, nearly flat; sterile and fertile spikes close together, both cylindrical.

HAB. Marshes and pools. Can. to Car. July, Aug. 24.—Stem 5-6 feet high. Leaves very long. Flowers in a compact cylindrical spike. Cat Tail. Reed Mace.

2. T. angustifolia Linn.: leaves linear, channelled; sterile and fertile spikes a little distant from each other; both cylindrical.

HAB. Marshes, &c. N. Y. to Vir. July, Aug. 21.—Stem 4-5 feet high. Leaves narrower than in the preceding.

ORDER CXXXV. AROIDEÆ. Juss. Lind.

Flowers diclinous, arranged upon a spadix, often naked. Perianth 4-6-parted, or wanting. Stamens definite or indefinite, hypogynous, very short; anthers 1-2- or many-celled, ovate, turned outwards. Ovary free, 1- rarely 3-celled; stigma sessile. Fruit succulent or dry, not opening. Seeds solitary or several; embryo in the axis of fleshy or mealy albumen, straight, cylindrical, with a cleft on one side in which lies the plumule; radicle next the hilum, rarely at the opposite extremity.

Herbs or shrubs. Roots often tuberous or thickened. Leaves sheathing at base, with parallel or branching veins.

1. ACORUS. Linn.

Spadix cylindric, covered with flowers. Perianth glumaceous, 6-petalled, naked. Stamens 6. Ovary 1. Style none. Capsule 3-angled, 3-celled.

Hexandria. Monogynia.

A. calamus Linn.: spadix protruding from the side of an ensiform leaf.

Hab. Swamps. Can. to Car. June. 21.—Leaves 2—3 feet long. Scape leafy above the spadix. Spadix cylindrical, thick, covered with minute greenish-flowers. The root is aromatic.

Sweet Flag.

2. ORONTIUM. Linn.

Spadix cylindric, crowded with flowers. Perianth 6-petalled, naked. Style and stigma scarcely any. Utricle 1-seeded.

Hexandria. Monogynia.

O. aquaticum Linn.: leaves all radical, lanceolate-ovate; scape cylindrical, spiked.—Pothos ovata Walt.

HAB. In water. Can. to Flor. May. 21.—Leaves radical, becoming large, varying in breadth. Flowers yellow, in a close-cylindrical spike, with a peculiar smell. Golden Club.

3. ARUM. Linn.

Spathe 1-leaved, cucultate, convolute at base. Spadix naked at the extremity, with sessile anthers in the middle and ovaries at the base. Berry 1-celled, many-seeded.

Monoccia. Polyandria.

1. A. dracontium Linn.: stemless; leaves pedate; leafets lanceolateoblong, entire; spadix subulate, longer than the oblong convolute spathe.

HAB. Banks of streams. N. Y. to Flor. June, July. 21.—

Scape about a foot long. Leaf 1, on a petiole as long as or longer than the scape. Spathe short, convolute.—Found on the banks of the Hudson, near Albany.

Green Dragon.

2. A. triphyllum Linn.: stemless; leaves ternate; leafets oval, acuminate, very entire; spadix clavate; spathe peduncled, ovate, acuminate, convolute below, flat and bent over above.

HAB. Wet woods. Can. to Car. May, June. 24.—Root tuberous. Leaves 1—2, on long petioles. Spathe green or purple.—Whole plant acrid and almost caustic. Big. Med. Bot. i. 52.

Indian Turnip.

3. A. atrorubens Linn.: stemless; leaves ternate; leafets ovate, acuminate; spadix cylindrical; spathe sessile ovate, acuminate, spreading horizontally above.

HAB. Swamps. Penn. to Vir. May, June. 21.—Spathe dark brown; smell disagreeable.—Mr. Schweinitz informs me that this plant is found at Easton, Penn., and he thinks it distinct from the preceding.

4. RENSSELAERIA. Beck.

Spathe convolute. Spadix covered with flowers, fertile at the base, sterile above. Perianth none. Berry 1-seeded.

Monoecia. Polyandria.

Ons. This genus, proposed by Mr. William Cooper of New-York, was named by him *Lecontia*, in honor of the distinguished naturalist, Capt. John Le Conte, of the U. S. army. But this name, which was adopted by Dr. Torrey in his Compendium, is applied by A. Richard to a genus of the order Rublacee, and confirmed by De Candolle in his Prodromus. I have therefore changed that of Mr. Cooper's genus, by calling it after the Hon. Stephen Van Rensselaer; who, for his efficient patronage of the Natural Sciences, is entitled to the respect and gratitude of all their cultivators.

R. virginica Beck .- Arum virginicum Linn .- Calla virginica Mich.

Big.-Lecontia virginica Coop. Torr. Eat.

Hab. Swamps. N. Y. to Car. July. 21.—Scapes several from one root, 12—18 inches long. Lcaves on long petioles, oblong, hastate-cordate, with the lobes obtuse, a foot or more long. Spathe lanceolate, involute, border undulate, closely embracing the spadix, which is long and slender. Berrics 1-seeded.

5. CALLA. Linn.

Spathe ovate, somewhat flattened. Spadix covered with flowers. Perianth none. Berry many-celled, many-seeded.

Monoecia. Polyandria.

C. palustris Linn.: leaves cordate; spathe flat; spadix covered with perfect flowers.

Hab. Spliagnous swamps. Can. and N. S. July, Aug. 24.—
Root thick and creeping. Scape 6—8 inches high. Leaves on long petioles, cordate, acuminate, with an involute point. Spathe oval, green on the outside, white within. Water Arum.

6. SYMPLOCARPUS. Salisb.

Spathe ventricose-ovate, acuminate. Spadix roundish, covered with perfect flowers. Perianth deeply 4-parted, persistent; segments cucullate, truncate, becoming thick and spongy. Style pyramidal, 4-sided. Stigma simple, minute. Seeds numerous, globular, imbedded in the spadix.

Tetrandria. Monogynia.

S. fatidus Nutt.—Ictodes fatidus Big.—Pothos fatida Mich. HAB. Wet meadows. Can. to Vir. Feb.—April. 24.—Root large, with thick fibres. Leaves very large, cordate-ovate, smooth. Spathe ovate, cucullate, purple, spotted with green and yellow. Spadix peduncled.—Whole plant very fetid. Medicinal. Big. Med. Bot. ii. 41. Skunk Cabbage.

ORDER CXXXVI. PISTIACEÆ. Rich. Lind.

Flowers 2, naked, enclosed in a spathe. Stamens definite, 2—7. Ovary 1-celled, with one or more erect ovules; style short; stigma simple. Fruit membranous or capsular, not opening. Seeds 1 or more, with a fungous integument and a thickened indurated foramen; embryo either in the axis of fleshy albumen and having a lateral cleft for the emission of the plumule, or at the apex of the nucleus.

Floating plants, with very cellular, lenticular, or lobed

stems and leaves confounded.

1. LEMNA. Linn.

Sterile and fertile flowers collateral. Stamens 2. Utricle 1—5-seeded. Diandria. Monogynia.

Obs. For an excellent and detailed account of this singular genus, I would refer to Dr. Hooker's Flora Scotica.

1. L. trisulca Linn.: fronds thin, elliptic-lanceolate, caudate at one extremity, at the other serrate; root solitary.

Hab. Ditches and ponds. N. S.; rarely in flower. July. . .

Fronds half an inch or more in length, thin, margin pellucid; young fronds produced from lateral clefts, of the same shape as the parent plant, and again proliferous before they are detached. Flowers very minute. Root a single fibre.

Duck's Meat.

- L. minor Linn.: fronds nearly ovate, compressed; root solitary.
 HAR. Stagnant waters. N. S. June, July. . Fronds a line and a half long, slightly convex beneath, somewhat fleshy, increasing rapidly by gemmæ (young fronds) so as often completely to cover the surface of stagnant water.
- 3. L. gibba Linn.: fronds broadly ovate, almost flat above, hemispherical and pale beneath; root solitary.
 - HAB. Stagnant waters, near Liverpool, N. Y. Pursh. June, July. .—Distinguished from the former by its being pale and hemispherical beneath, and appearing reticulated.
- 4. L. polyrrhiza Linn.: fronds obovate-rotundulate, compressed; roots numerous, fascicled.
 - HAB. Stagnant waters. June, July. . —Fronds 3—4 lines long, succulent, of a firm texture. Root a bundle of 8 or 10 simple fibres in the middle of the frond.

ORDER CXXXVII. FLUVIALES. Lind.

Flowers monoclinous or diclinous. Perianth 2- or 4-parted, often deciduous, rarely wanting. Stamens definite, hypogynous. Ovaries 1 or more, superior; ovule solitary; style 1 or none; stigma simple. Fruit dry, not opening, 1-celled, 1-seeded. Seed pendulous; albumen none; embryo straight or curved, with a lateral cleft for the emission of the plumule. Water plants. Leaves very cellular, with parallel veins.

1. ZOSTERA. Linn.

Stamens and pistils separated, inserted in 2 rows upon one side of a spadix. Spathe foliaceous. Perianth none. Sterile Fl. Anthers ovate, sessile, alternating with the germs, and upon the same spadix. Fertile Fl. Ovary 1, ovate. Style bifid. Drupe 1-seeded. Monoecia. Monandria.

Z. marina Linn: leaves entire, somewhat 3-nerved; stem roundish. Hab. Muddy shores. N. Y. to Car. Aug. 21.—Stem terete, flexuous, throwing out roots from the joints. Leaves very long and narrow. Spadix linear, with the flowers all on one side, in 2 rows.

Grass-verack.

2. CAULINIA. Willd.

Monoecious. Perianth none. Sterile Fl. Anther sessile. Fertile Fl. Style filiform. Stigma bifid. Capsule 1-seeded.

Monoecia. Monandria.

1. C. fragilis Willd.: leaves ternate or opposite, linear-subulate, recurved, aculeate-dentate, rigid.

HAB. In water. Penn. Aug. . Stem long, submerged. Flowers small.

2. C. flexilis Willd: leaves whorled in sixes, linear, denticulate at the apex, spreading.

Hab. Ponds and ditches. N. Y. to Car. Aug. . — Stem 1—2 feet long, submerged, branching, jointed. Flower solitary, axillary, sessile.

3. ZANNICHELLIA. Linn.

Monoecious. Sterile Fl. Perianth none. Stamen 1. Fertile Fl. Perianth single, of 1 leaf. Ovaries 4 or more. Style 1. Stigma peltate. Capsule sessile.

Monoecia. Monandria.

1. Z. palustris Linn.: anthers 4-celled; stigmas entire; pericarps toothed on the back.

HAR. Ditches. N. S. Torr. July, Aug. @.—Stem long, filiform. Leaves opposite, linear. Flowers axillary, small.

Horn Pond-weed.

2. Z. intermedia Torr.: anther 2-celled; stigmas dentate-crenate; seed smooth, entire on the back.

HAB. Salt marsh ditches. July. @.—Submerged. Stem filiform. Leaves entire. Flowers inconspicuous. Torr.

4. RUPPIA. Linn.

Flowers 2, perfect, on a spadix arising from the sheathing base of the leaves. Stamens 4, sessile. Ovaries 4. Perianth none. Drupes 4, pedicellate; nuts 1-seeded.

Tetrandria. Tetragynia.

R. maritima Linn.

HAB. Salt marshes. N. J. to Geor. July. 21.—Stem long, filiform, branched, floating. Leaves linear, setaceous, with inflated sheaths. Spadix short, with 2 naked green flowers. Anthers large.

5. POTAMOGETON. Linn.

Flowers perfect, on a spadix arising from a spathe. Perianth single, 4-leaved. Anthers 4, sessile, alternating with the divisions of the perianth. Ovaries 4. Nuts 4, 1-seeded, sessile. Tetrandria. Tetragynia.

* Upper leaves floating.

1. P. natans Linn.: upper leaves floating, coriaceous, on long petioles, oblong-ovate; lower ones membranous, linear-lanceolate, gradually tapering into a petiole.—P. natans b. Mich.

Hab. Ponds and lakes. N. S. July, Aug. 21.—Stem varying in length. Leaves sometimes cordate. Spadix 1—2 inches long, rising above the water.

Pond Weed.

2. P. fluitans Linn.: upper leaves floating, subcoriaceous, ovatelanceolate, obtuse, tapering into a rather short petiole; lower ones very long, lanceolate, membranous and sessile.

HAB. Ponds and streams. N. Y. to Car. July, Aug. 21.— Stem varying in length. Leaves reddish, less coriaceous than in the preceding. Spadix an inch long, almost submerged.

3. P. heterophyllum Schreb.: upper leaves floating, coriaceous, elliptical, petiolate; lower ones membranous, linear-lanceolate, sessile.—
P. hybridum Mich.

Hab. Stagnant water. N. Y. to Car. Aug. 24.—Smaller than the former. In flowing water the lower leaves are very long and narrow.

4. P. diversifolium Bart.: upper leaves floating, elliptical, petiolate,

5-nerved; lower ones filiform; spadix axillary, almost sessile, few-flowered.—P. sctuceum Pursh.

HAB. Ponds and small streams. N. S. June. 4.—Stems numerous, branched, filiform. Upper leaves scarcely an inch long. Spadix 4—6-flowered.

** Leaves all submersed.

5. P. perfoliatum Linn.: leaves clasping, cordate, ovate.

Hab. Lakes, &c. Can. to Penn. Aug. 21.—Stem dichotomous. Leaves an inch or more in length, appearing perfoliate. Spadix few-flowered, on a short peduncle.

6. P. lucens Linn.: leaves ovate-lanceolate, petiolate.

HAB. Rivers and lakes. Can. to Car. Aug. 21.—Stem long, branched. Leaves large, very pellucid and finely veined. Spadix cylindrical, many-flowered.

- 7. P. densum Linn.: leaves opposite, crowded, ovate, acuminate, sessile; stem forked; spike about 4-flowered, on very short peduncles.

 Hab. Pools, &c. Bethlehem, Penn. Schweinitz.
- 8. P. crispum Linn.: leaves lanceolate, tapering, sessile, much waved, serrate.

Hab. Lakes. Can. to Vir. Pursh. Aug. 24.—Stem long, much branched. Leaves 1—1-2 inches long, 2—3 lines broad, crisp to the touch. Spadix 8—10 flowcred.

9. P. compressum Linn.: leaves linear, very obtuse, sessile; stem compressed, 4—6-flowered.

HAB. In water. N. S. July, Aug. 21.—Plant small. Stem much branched, thick. Leaves 2 inches long, linear.

10. P. pauciflorum Pursh: leafy; leaves sessile, narrow linear, flat; the upper verticillate; spadix capitate, 4-flowered; stem slender, terete.—P. gramineum Mich.

HAB. Ponds and rivers. N. Y. to Car. July, Aug. 21.—Stem almost filiform, much branched. Leaves 2—3 inches long, not more than half a line broad.

11. P. pectinatum Linn.: leaves distichous, setaceous, alternate, sheathing; stipules scarcely any; spadix few-flowcred, interrupted.—P. marinum Mich.

Hab. Ponds. Can. and N. S. June. 21.—Stem filiform, much branched. Leaves very numerous, giving to the plant a pectinated appearance.

SUBCLASS II. GLUMACEÆ. Lind.

Flowers destitute of a true perianth, but consisting of imbricated bracts.

ORDER CXXXVIII. GRAMINEÆ. Juss. Lind. Flowers usually monoclinous, sometimes monoecious or

polygamous; consisting of imbricated bracts, of which the most exterior are called glumes, (calyx of Linnæus,) the interior immediately enclosing the stamens palex, (corol Linn.) and the innermost at the base of the ovary scales, (nectary Linn.) Glumes usually 2, alternate, sometimes single, most commonly unequal. Palex 2, alternate; the lower or exterior simple; the upper or interior composed of 2 united by their contiguous margins, and usually with 2 keels, together forming a kind of dislocated calyx. Scales 2 or 3, sometimes wanting; if 2, collateral, alternate with the palex, and next the lower of them; distinct or united. Stamens hypogynous, 1—6, or rarely indefinite; anthers versatile. Ovary simple; styles 2, rarely 1 or 3; stigmas feathery or hairy. Pericarp usually undistinguishable from the seed, membranous. Albumen farinaceous; embryo lying on one side of the albumen near its base.

Culms cylindrical, hollow, jointed. Leaves alternate, with a split sheath. Flowers in little spikes called locustæ, arranged in a spiked, racemed, or panieled manner.

Div. 1. Agrostidem. Inflorescence panicled, sometimes contracted into the form of a spike. Spikelets solitary, 1-flowered. Glumes and palew of nearly similar texture, most usually with a keel. Lower palew either bearded or beardless, the upper never with 2 keels.

1. AGROSTIS. Linn.

Glume naked, beardless, 2-valved, 1-flowered; valves longer than the palew. Palew 2, membranous, often hairy at base, enclosing the seed.

Triandria. Digynia.

1. A. stricta Willd.: panicle elongated, straight; valves of the glume equal; palcæ smaller than the valves, unequal, with an awn at the base of the outer one longer than the flower.

IIAB. Fields. N. Eng. Muhl. June. 21.—Culm erect, smooth with black nodes. Leaves linear-lanceolate, scabrous on the margin. Aum geniculate, twice as long as the flower.

2. A. rulgaris Smith: panicle with smoothish and at length divaricate branches; palew unequal, outer one 3-nerved; stipule very short and truncate.—A. hispida Willd.

Hab. Meadows. Throughout the U. S. July. 21.—Culm 18—20 inches high, ascending, smooth. Leaves flat, scabrous. Flowers purplish. Introduced. Red-top.

3. A. alba Linn.: panicle lax, with hispid and spreading branches;

palee shorter than the glume, outer one 5-nerved; stipule oblong.—
A. decumbers Muhl.—A. stolonifera Smith.

Hab. Meadows. N. S. June—Aug. @.—Root creeping. Culm assurgent, often throwing out runners. Leaves nerved, scabrous.

Authors yellow. Introduced. Fiorin Grass.

4. A. lateriflora Mich.: culm erect, branched above, soboliferous at base; panicles lateral and terminal, contracted, dense, a little secund; glume acuminate; palem longer than the glume, equal, pubescent at base, awnless.—A. mexicana Muhl.

b. filiformis Torr.: paniele very slender; paleæ nearly equalling the glume.—.4. filiformis Muhl.

Hab. Swamps. N. S. Aug., Sept. 21.—Root creeping. Culm 2 feet or more high. Leaves broad linear, flat. Anthers pale purple.

5. A. sobolifera Muhl.: culm erect, branched; panicle contracted, filiform, simple, with appressed alternate branches; palee longer than the equal glumes, equal, awnless, hairy at base, mucronate at the tip.

HAE. Rocky hills. N. S. Aug., Sept. 21.—Culm 2 feet high, soboliferous, sometimes decumbent. Leaves pale green, somewhat scabrous.

6. A. tenuiflora Willd.: culm nearly simple, pubescent about the joints; branches appressed; panicle contracted, filiform; paleæ longer than the glume; lower one with an awn twice as long as the flower.

Hab. Rocky woods. Can. to Car. July, Aug. 21.—Root creeping. Culm 3 feet or more high. Leaves few, spreading. strongly nerved.

7. A. sylvatica Torr.: culm erect, much branched, diffuse, smooth; sheaths lacerate; panicle filiform; paleæ longer than the glume; awns three times as long as the flower.——A. diffusa Muhl.

Hab. Rocks. N. J. Aug. 21.—Root creeping. Culm 2-3 feet high.—Resembles the preceding, but is distinguished by its branched diffuse culm.

8. A. compressa Torr.: whole plant very smooth; culm erect, compressed, simple; panicle oblong, subcontracted; glumes equal, shorter than the paleæ, acute; paleæ rather obtuse, smooth at the base.

Hab. Sandy swamps. N. J. Sept. 21.—Root creeping. Culm soboliferous Leaves linear, long, compressed, with carinate sheaths. Panicle purple.

9. A. serotina Torr.: culm filiform, much compressed; leaves very narrow, carinate, erect; paniele attenuate; glume unequal, half as long as the awnless paleæ.

Hab. Sandy swamps. N. J. Sept. 21.—Culm 12—18 inches high. Leaves almost filiform. Punicle slender, with the branches flexuous.

10. A. juncea Mich.: leaves straight and erect, convolutely setaceous; panicle oblong-pyramidal, verticillate; paleæ awnless, twice the length of the glume.—A. indica Muhl.

- HAB. Sandy barrens. N. J. to Flor. Oct. 24.—Culm 1—2 feet high, terete. Flowers purple. Glume unequal. Scales ob-
- 11. A. virginica Linn.: culms numerous, procumbent at base, assurgent; leaves subdistichous, involute, rigid; panicles lateral and terminal, spike-form; the lateral ones concealed; glume equal, about as long as the palew .- A. pungens Pursh.

HAB. Sandy soils. N. Y. to Vir. Sept. Oct. Q .- Culms a foot high, hairy at base, with swollen sheaths. Anthers purple.

- 12. A. longifolia Torr.: panicle contracted, spiked, generally concealed; paleæ much longer than the glume, subequal, smooth and spotless, without awns; leaves very long, filiform and recurved at the apex.
 - HAB. Sandy fields. N. S. Sept. Oct. 21.-Culm 2-4 feet high, simple, terete. Leaves 2 feet long. Panicle sometimes exserted.
- 13. A. clandestina Spreng. : panicle spiked, partly concealed; paleæ unequal, much longer than the glume, hairy and spotted, slightly awned; leaves very long.

HAB. Dry hills. Penn. to Car. Sept. 21 .- Culm 2 feet high, terete. Panicle often sooty. Glume carinate.

14. A. spica-venti Willd.; outer palew with a very long straight awn; panicle spreading.

HAB. N. S. June. Q .- Culm 18 inches high. Introduced.

15. A. canina Willd.: culm prostrate, somewhat branching; palex with a recurved dorsal awn.

HAB. Wet meadows. July. 21.-Introduced.

2. TRICHODIUM. Mich.

Glume 2-valved, 1-flowered. Palea 1, shorter than the glumes, bearded and supported at the base by one or two fassicles of hairs. Seed loose, covered by the paleæ.

Triandria. Digynia.

1. T. laxiflorum Mich.: culm erect; leaves setaceous, and with the sheaths somewhat scabrous; panicle diffuse, capillary, with trichotomous branches; glumes unequal.—Agrostis laxa Muhl.

HAB. Dry fields. Subarc. Amer. to Car. May, June. 21.— Culm 18 inches high. Panicle at length much spread and loose, pyramidal.

2. T. scabrum Muhl.: culm geniculate at the base, assurgent, branched; leaves linear-lanceolate, flat, striate, scabrous; sheaths mostly smooth; panicle verticillate and divaricate; glumes unequal; paleæ ovate, acute, 3-nerved. - Agrostris scabra Willd.

HAB. Woods. N. S. Aug., Sept. 21.-Culm 12-18 inches

3. T. clatum Pursh: culm erect, firm; leaves narrow-linear, flat, scabrous; sheaths smooth; panicle verticillate, a little spreading; glumes nearly equal.

HAB. Sandy swamps. N. J. Aug. 21 .- Culm 3 feet high.

Panicle exsert, purple.

4. T. montanum Torr.: culm eespitose, erect; leaves involute, filiform, and as well as the sheaths, scabrous; panicle capillary, loose, a little spreading; glumes equal.

HAB. Mountains. N. Y. July. 21.—Culm 8-12 inches high.

Panicle elongated.

3. POLYPOGON. Desf.

Glume 2-valved, 1-flowered; valves nearly equal, obtuse at the end, with a long bristle. Palex shorter than the glume; the lower one entire, with a short straight tender bristle, (sometimes awnless); upper one bifid, toothed.—Panicle contracted like a spike.

Triandria. Digynia.

P. racemosus Nutt.: panicle dense, conglomerate, interrupted; bristles of the glume scabrous; palex unarmed, hairy at the base; culm branehed.—A grostris racemosa Mich.—A. setosa Muhl.

HAB. Bogs. N. S. W. to Miss. Aug., Sept. 24.—Culm 3—4 feet high, compressed. Leaves scabrous and somewhat glaucous, flat. Panicle 2 inches long, many-flowered, interrupted below.

4. TRICHOCHLOA. De Cand.

Glume 2-valved, 1-flowered, very minute. Palew much larger than the glume, naked at base; lower one convolute at the base, terminating in a long awn not articulated.

Triandria. Digynia.

T. capillaris De Cand.: leaves convolute-filiform, smooth; panicle diffuse, capillary, very slender; pedicels longer than the awns; awns 3—4 times the length of the flower.—Stipa sericea Mich. Pursh.—Agroslis sericea Muhl. Ell.

HAB. Sandy fields. Mass. to Car. June, July. 21.—Culms cespitose, 2 feet high, very slender. Panicle 8—10 inches long, glossy and purple.

5. CINNA. Linn.

Glume naked, beardless, 2-valved, compressed, nearly equal. Palex 2, nearly equal, compressed, shortly stipitate, naked at the base; lower one inclosing the upper, with a short awn near the summit. Stamen 1. Monandria. Monogynia.

C. arundinacca Willd.: panicle large, capillary, loose; leaves broad-linear; culm smooth.—Agrostis cinna Pursh.

IIAB. Wet grounds. Can. to Car. Aug. 24.—Culm 2-5 feet high. Leaves a foot or more in length. Panicle terminal, 8—10, inches long, with the flowers green.

6. MUHLENBERGIA. Schreb.

Glume 2-valved; valves very minute, fringed. Paleæ much longer than the glume, ovate, obliquely truncate, gibbous; the lower one terminating in a slender bristle.—Panicle nearly simple.

Triandria. Digynia.

1. M. diffusa Schreb.: culm diffuse (decumbent); leaves linear-lanceolate; panicle branched, appressed; awns as long as the paleæ.

IIAB. Fields. N. Y. to Car. July. 21.—Culm 18 inches long, compressed, geniculate-branched. Leaves scabrous. Panietes lateral and terminal, very slender; bristle purple.

2. M. erecta Schreb.: eulm erect, simple, and with the leaves pubeseent; panicle loose; paleæ 2, with a very long awn.—Brachyelytrum aristatum Beaur. Torr.

HAB. Rocky hills. Can. to Car. July. 24.—Root creeping. Culm 2—3 feet high, erect, slender. Leaves pubescent. Paniele contracted. Lower palea with a very long bristle.

7. ALOPECURUS, Linn.

Glume 2-valved, 1-flowered; valves somewhat equal, connate, distinct. Palex united into a bladder-like glume, cleft on one side below the middle, generally bearded. Styles often connate.—Paniele spiked, cylindric. Triandria. Digynia.

1. A. pratensis Linn.: culm erect, smooth; panicle subspiked, eylindric, obtuse, thick; glumes ciliate, connate below the middle, as long as the palew.

IIAB. Fields and pastures. N. S. May—Aug. 2f.—Culm simple, 2—4 feet high. Leaves flat, smooth. Spike 1 1-2 inches long. Introduced. Fox-tail Grass.

2. A. geniculatus Linn.: culm ascending, geniculate; panicle spiked, cylindrical, obtuse; glumes connate at base, obtuse, hairy on the back and margin; paleæ truncate; styles free.

b. aristulatus Torr.: awn scarcely exserted.—A. aristulatus Mich.
 A. subaristatus Pursh.

IIAB. Wct meadows. Can. and N. S. N. to Arc. Amer.; rare. June. 24.—Culm 12—18 inches high, knee-jointed and rooting below, tcrete, smooth. Leaves linear-lanceolate, very acute. Spike nearly 2 inches long. Var. a. has the awn as long again as the palew.

8. PHLEUM. Linn.

Glume 2-valved, much longer than the paleæ; valves equal, boat-shaped, rostrate or mucronate. Paleæ 2, included in

the glume, boat-shaped, awnless, truncate.—Panicle spiked, dense, cylindric. Triandria. Digynia.

P. pratense Linn.: spike cylindric; glumes truncate, mucronate, with a ciliate keel; awn shorter than the glume; culm erect.

Hab. Fields. N. S. June—Aug. 21.—Culm 2—3 feet high, simple, smooth. Leaves flat. Spike long, cylindric, green. Introduced. Herds Grass or Cat's-tail Grass.

9. PHALARIS. Linn.

Glume 2-valved, 1-flowered; valves nearly equal, membranaceous, gibbous on the back, carinate. Palea 2, coriaceous, hairy at the base, shorter than the glume. Rudiments opposite, sessile, resembling valves. Scales collateral.—Flowers generally in compound, ovate or elongated spikes.

Triandria. Digynia.

1. P. americana Ell.: panicle oblong, spiked; glumes boat-shaped, serrulate; paleæ unequal; rudiments hairy.—P. arundinacea Mich.—Calamagrostis colorata Nutt.

HAB. Swamps. Can. to Car. July, Aug. 21.—Culm 2-5 feet high, erect, a little branching. Panicle 2-4 inches long, at length a little spreading.

American Canary Grass.

2. P. canariensis Linn.: panicle subspiked, ovate; glumes boat-shaped, entire at the apex; rudiments smooth.

Hab. In pastures, &c. July. O.—Culm a foot and half high.

Leaves broad-linear. Glumes nearly twice the length of the palew. Introduced.

Canary Grass.

10. CRYPSIS. Ait.

Glume 2-valved, 1-flowered, compressed, unequal. Palex 2, unequal, longer than the glume. Stamens 2-3. Seed loose, covered by the palex.—Flowers in an oblong spike.

Triandria. Digynia.

C. virginica Nutt.: spike oblong-cylindrical, thick and lobed; culm procumbent and geniculate; leaves at length involute, rigid, pungent.

HAB. Sandy fields. Near Philadelphia. Aug.—Oct. O.—
Culm 6—12 inches long, much branched from the base. Leaves at first flat, striate, hairy on the upper surface. Spikes lateral and terminal.

DIV. II. PANICEE. Inflorescence spiked or panicled. Spikelets either solitary, in pairs, or several together, one or more usually 2-flowered, one of the flowers being sterile or unisexual. Glumes usually of a thinner texture than the palex, which are more or less cartilaginous, the lower one half enfolding the upper, and either beardless or occasionally bearded; neither of them with a keel.

11. MILIUM. Linn.

Glume 2-valved, naked, beardless. Paleæ 2, oblong, concave, shorter than the glume, awnless. Seed coated with the indurated paleæ.—Flowers panieled. Triandria. Digynia.

1. M. effusum Linn.: panicle diffuse, compound; branches horizontal; glumes ovate, very obtuse; paleæ awnless, smooth and shining; leaves broad-linear.

HAB. Woods. Can. and N. S. July. Z.—Culm 5—8 feet high, simple, smooth. Panicle oblong, 8 inches in length.

Common Millet-grass.

- 2. M. amplicarpon Pursh: leaves linear-lanceolate, hairy, eiliate; panicle simple, contracted, bearing perfect flowers; fertile flowers in solitary elongated radical scapes, at length subterraneous.—M. ciliatum Muhl.
 - HAB. Sandy swamps. N. J. Aug., Sept. 2f.—Culms numerous, 1—2 feet high, assurgent. Panicle appressed. Glumcs acuminate.—This species is well figured by Pursh.
- 3. M. pungens Torr.: culm erect; leaves lanceolate, very short, pungent, at length involute; panicle contracted; branches generally in pairs, 2-flowered; flowers awnless, ovate; paleæ hairy.

HAR. Rocky hills. N. S. May. 24.—Culm slender, 12—18 inches high, simple, rigid. Radical leaves 6—8 inches long, about a line wide, acute and pungent. Panicle oblong, fewflowered. Style 2-parted. Dwarf Millet-grass.

12. PIPTATHERUM. Beauv.

Glume membranaceous. Palea cartilaginous, elliptical, shorter than the glume; lower one awned at the tip. Scales ovate, entire.—Flowers panieled. Triandria. Digynia.

P. nigrum Torr.: panicle simple; flowers racemose, ovate-lanceolate; palee black, hairy; awn as long again as the glume.—Oryzopsis melanocarpa Muhl.—Milium racemosum Smith. Big.

HAB. Rocky hills. N. S. Aug. 24.—Culm 2—3 feet high.
 Leaves long, linear-lanceolate. Panicle few-flowered, flexuous.
 Lower paleae with a very long awn. Seed black.

Black-seeded Millet-grass.

13. PANICUM. Linn.

Glume 2-valved; valves unequal, the lower one very small. Florets dissimilar, the lower one abortive, or antheriferous. Paleæ concave, equal, beardless. Seed coated with the hardened paleæ.—Panicle loose and scattered.

Triandria. Digynia.

· Flowers in dense racemes.

1. P. crus-galli Linn.: racemes alternate and in pairs, compound;

rachis 5-angled; glumes terminating in hispid bristles; sheaths glabrous.

- HAB. Near cultivated grounds. Aug., Sept. . Culm 2—4 feet high, terete. Panicle dense, at length spreading, sometimes coloured.—It varies with unarmed glumes. Introduced. Cocksfoot-grass.
- 2. P. hispidum Muhl.: paniele compound, nodding; racemes alternate; glumes terminating in hispid bristles; sheaths hispid.
 - Hab. Salt marshes. N. Y. to Car. Sept., Oct. ©.—Culm 3—4 feet high, thick. Punicle dense. Flowers always awned.
 —Resembles No. 1, but may be distinguished by its hispid sheaths.
- 3. P. clandestinum Linn.: culm with short axillary branches; leaves broad-lanceolate, cordate at the base; sheaths hispid, enclosing the short panicles; abortive floret neutral, 2-valved; upper valve obtuse.

 —P. latifolium var. clandestinum Pursh.
 - HAB. Moist woods. N. Y. to Car. July, Aug. 21.—Culm 2—3 feet high, erect and rigid. Panicles terminal and lateral, concealed in the sheaths of the leaves.
- 4. P. pedunculatum Torr.: culm dichotomous; leaves broad-lanceolate, slightly hairy above, attenuate; sheaths hispid and papillose; panicle long-pedunculate, compound, smooth; spikelets ovate, smooth; abortive floret 2-valved; upper valve half the length of the lower.

HAB. Moist woods. N. Y. July. 21.—Culm 3—4 feet high, much branched above. Panicle terminal, spreading, on a peduncle.

5. P. latifolium Lium.: culm mostly simple, bearded at the joints; leaves oblong-lanceolate, smooth, or with the sheaths somewhat pubescent; panicle terminal, a little exsert, simple, pubescent; spikelets oblong-ovate; abortive floret antheriferous, 2-valved; upper valves sub-herbaceous, nearly as long as the lower, acute.

Hab. Woods. Can. to Car. W. to Ill. June, July. 24.— Culm a foot high. Panicle 2 inches long, with pubescent downy

branches.

6. P. scoparium Lam.: whole plant softly villous; leaves lanceolate; panicle erect, compound, setaceous, much branched; spikelets turgid, ovate, pubescent.

HAB. N. J. to Car. 21.—Culm 2 feet high, mostly simple Flowers larger than in any of our species.—Scarcely differs from

the preceding.

- 7. P. nervosum Muhl.: culm simple; nodes smooth; leaves broadlanceolate, smooth, a little ciliate on the margin; panicle much branched, smooth, many-flowered; spikelets oblong; abortive floret antheriferous, with the upper valve sub-herbaceous, shorter than the lower.
 - Hab. Bogs. N. Y. to Car. July. 21.—Culm 3-4 feet high. Panicle 4-5 inches long, decompound.—Allied to P. latifolium,

but is taller and has the joints smooth and the panicle decompound and smooth.

- 8. P. macrocarpon Torr.: culm erect, simple; leaves linear-lanceolate, erect, a little hairy beneath; joints naked; sheaths hispid; panicle rather compound, smooth; spikelets ovate-globose; abortive floret neutral.
 - HAB. Banks of streams. N. J. and Mass. July. 21.—Culm 3 feet high, straight. Punicle with few spreading flexuous branches.
- 9. P. pubescens Lam.: crect, much branched, leafy, softly pubescent; leaves lanceolate, ciliate; panicle small, few-flowered, free; spikelets subglobose-ovate, pubescent.

Hab. Shady woods. Penn. to Car. July. 21.—Culm 18 inches high; nodes and leaves hairy. Panicle with horizontal branches.

- 10. P. involutum Torr.: culm cespitose, simple, or a little branched at the base; leaves erect, somewhat rigid, very narrow, at length involute; panicle simple, few-flowered; florets acuminate; upper valve of the neutral floret very small.
 - HAB. Near Deerfield, Mass. Torr. 21.—Culm a foot high. Panicle terminal, (rarely lateral,) consisting of a few flexuous branches.
- 11. P. depauperatum Mahl.: culm cespitose, hairy at the joints; leaves linear-lanceolate, smooth or hairy; sheaths pubescent; panicle few-flowered; branches in pairs, one of them 2-flowered, the other 1-flowered.
 - HAB. Sandy soils. N. Y. and N. J. May, June. 21.—Culm a foot high, jointed. Panicle terminal, erect, with tortuous branches.
- 12. P. dichotomum Linn.: culm much branched and dichotomous above; branches fasciculate; leaves very numerous, lanceolate, smooth; panicle simple, capillary, lax; abortive floret neuter; upper valve minute, bifid.
 - IIAB. Dry woods. N. Y. to Car. July—Sept. 21.—Culm erect, sometimes decumbent, 8—12 or more inches long. Panicles lateral and terminal, with spreading branches.—Dr. Torrey describes three varieties of this species.
- 13. P. nitidum Lam.: culm slender, simple, erect, smooth; sheaths, bearded at the throat; leaves very few, broad-linear; panicle capillary, rather crowded, compound, remote, smooth; spikelets minute, obtuse, ovate, slightly pubescent; lower glume very small.

a. ciliatum: culm hairy; leaves linear-lanceate, (the lowest one broader) sparingly hirsute, ciliate on the margin; panicle with

the branches and flowers pubescent.

b. ramulosum: culm more branched; panicle contracted; branches smooth.

c. gracile: culm very slender, smooth; leaves very narrow, and with the sheaths smooth; panicle nearly simple, few-flowered, smooth; upper valve of the abortive floret minute, entire.

- d. pilosum: culm simple, very hairy; lower leaves approximate and broad-lanceolate; upper ones linear, rather rigid, somewhat hairy on the upper surface, ciliate at the base; sheaths villose and minutely papillose; panicle subcontracted; branches virgate and with the flowers pubescent.
- c. glabrum: smooth on every part, except the base of the leaves, nearly simple; lower leaves short, approximate, subcartilaginous; panicle branched, almost verticillate; spikelets large; upper valve of the abortive floret entire.—P. nitidum Schweintz.
- f. barbatum: culm simple, smooth; nodes hairy, leaves linear-lanceolate; sheaths smooth, except on the margin; flowers minutely pubescent.—P. discolor Muhl.
- HAB. Meadows, woods and pine barrens. N. S. June, July. 21.—Culm 18 inches to 2 feet high. Panicle compound.—A very variable grass—at least if Torrey's account of it be correct.
- 14. P. agrostoides Muhl.: culm compressed, smooth, erect; leaves very long; panicles lateral and terminal, pyramidal, spreading; branches bearing racemes; spikelets appressed; abortive floret neutral; valves nearly equal.—P. elongatum Pursh.
 - Hab. Wet meadows. N. Y. to Vir. July—Sept. 2f.—Culm 2—3 feet high, smooth at the joints. Panicle mostly dark purple.
- 15. P. virgatum Linn.: whole plant very smooth; panicle diffuse, very large; flowers acuminate; valve of the abortive floret nearly equal.
 - Hab. Near salt water. N. Y. to Car. July, Aug. 21.—Culm 3—4 feet high. Panicle virgate, at length spreading.
- 16. P. anceps Mich.: culm compressed; sheaths ancipitous, pilose; panicle with nearly simple branches; spikelets subracemose, much acuminate; abortive floret neuter, with the upper valve bifid.
 - Hab. Wet woods. Penn. to Car. 21.—Culm 3 feet high. Leaves very long. Panicle pyramidal.
- 17. P. rectum R. & S.: panicle solitary, shorter than the terminal leaf; branches simple, flexuous; spikelets alternate, peduncled, obovate, turgid; glumes striate, acute; leaves linear, straight, tapering to a sharp point, striate and scabrous above, hairy beneath; sheaths with very long hairs.—P. strictum Pursh.
 - HAB. Banks of streams. Penn. July. @. Pursh.
- 18. P. verrucosum Muhl: culm slender, decumbent and geniculate, branched below, and with the leaves smooth; panicle much spreading, few-flowered; flowers verrucose; abortive floret 1-valved.
 - Hab. Swamps. N. Y. to Geor. Aug., Sept. 21.—Culm a foot high; nodes smooth and inflated. Leaves lance-linear, spreading. Panicles lateral and terminal, spreading.
- 19. P. proliferum Lam.: culm assurgent, geniculate at base, very smooth; panicles terminal and axillary, smooth; spikelets racemose; abortive floret 1-valved.—P. dichotomiflorum Mich.—P. geniculatum Muhl.

- HAB. Wet meadows. Penn. to Geor. Sept. 21.—Plant very smooth. Culm 2—4 feet long, succulent. Leaves a foot or more long. Panicles large and pyramidal.
- 20. P. capillare Linn.: culm nearly simple; sheaths very hairy; panicle large, capillary, expanding, loose; spikelets on long peduncles, acuminate, smooth; abortive floret 1-valved.

a. sylvaticum Torr.: culm branched at the base, very slender; leaves linear.

HAB. Cultivated grounds. Can. to Flor. Var. a. Dry woods.
 N. Y. Aug., Sept. 21.—Culm 1—2 feet high, erect; sheaths hispid. Panicle large and pyramidal, reflexed when old.

21. P. longifolium Torr.: whole plant very smooth; culm compressed, erect, simple, slender; leaves very long and narrow; panicle simple, elongated, racemose; spikelets acuminate; abortive floret neutral, 2-valved.

HAB. Pine barrens. N. J. Sept., Oct. 21.—Culm 2 feet high. Leaves a foot or more long, very narrow. Panicle few-flowered.

14. SETARIA. P. de Beauv.

Has the same character as Panicum, except that the panicle is spiked. Triandria. Digynia.

1. S. viridis P. de B.: spike cylindrical; involucre of 4—10 fasciculate bristles, scabrous upward; spikelets geminate; perfect floret smooth; sheaths pubescent.—Panicum viride Linn.

Har. Sandy fields. N. S. July, Aug. @.—Culm 1 1-2 to 2 feet high, simple. Involuce longer than the flowers.

Wild Timothy.

2. S. glauca P. de B.: spike cylindrical; involucre of many fascicled bristles, scabrous upward; perfect floret transversely rugose.—Panicum glaucum Linn.

b. purpurascens Ell.: sheaths hairy; glumes and bristles of the involucre hairy.

HAB. Road sides, &c. N. S. July, Aug. O.—Culm 2 feet high. Spike 3-4 inches long. Introduced. Bottle Grass.

3. S. verticillata P. de B.: spike subverticillate; bristles of the involucre 2, retrosely scabrous; spikelets solitary; paleæ of the perfect floret nearly smooth.—Panicum verticillatum Linn.

Hab. Sandy grounds. N. S. July. O.—Culm 18 inches high. Spike 2 inches long. Introduced.

4. S. italica P. de B.: spike compound, interrupted at base, nodding; spikelets conglomerate; involucre many times longer than the flowers; rachis tomentose.—Panicum italicum Linn.

HAB. Ditches. N. J. to Car. July. . Culm 4 feet high. Panicle 6-8 inches long.

15. ORTHOPOGON. Brown.

Spike compound. Glume 2-valved, nearly equal, 2-flowered; valves unequally awned. Florets dissimilar; outer one staminiferous or neuter, 1- or 2-valved; inner pistiliferous surrounding the seed.

Triandria. Digynia.

O. echinatus Spreng.: spikes alternate, secund, simple; rachis triquetrous, smoothish; glumes nerved, muricate-hispid; leaves and sheaths smooth, striate.—Panicum echinatum Willd.

Hab. Penn. 2.—Mr. Schweinitz informs me that a variety of this species occurs at Bethlehem, Penn.

16. DIGITARIA. Haller.

Inflorescence digitate or fascicled. Spikelets in pairs, on short bifid peduncles. Glume 2-valved, the lower very minute. Lower floret abortive, the paleæ membranous. Upper floret perfect, the paleæ subcoriaceous, hardened. Seed slightly furrowed. Triandria. Digynia.

1. D. sanguinalis Scop.: spikes digitate, erect, somewhat spreading; leaves and sheaths pilose; florets oblong, pubescent at the edge.—
Panicum sanguinale Linn. Big.

Hab. Cultivated grounds. Can. to Car. Aug., Sept. O.— Culm 1—2 feet long, decumbent or assurgent. Spikes 4—6.

Crab Grass.

2. D. glabra R. & S.: spikes digitate, subalternate, (3-4) spreading; leaves and sheaths smooth; 'spikelets ovate, crowded; gluine equal to the abortive floret, both hairy.—D. ischaemum Muhl.—D. paspaloides Mich.

HAB. Sandy fields. N. Y. to Vir. Aug., Sept. @.—Culm a foot long, mostly decumbent. Spikes mostly 3, about 2 inches

long.

3. D. serotina Mich.: decumbent; leaves and sheaths very pubescent; spikes numerous, setaceous; spikelets all pedicellate; lower glume very minute.—D. rillosa Ell.

HAB. Wet places. N. Y. Muhl. S. to Car. June—Aug. ©. —Culm 12—18 inches long. Spikes 2—3 inches long.

4. D. filiformis Ell.: culm erect, filiform; leaves somewhat smooth; spikes 2—4, filiform, erect; spikelets in threes, all pedicellate; glumes 1-valved, as long as the abortive floret.—D. pilosa Mich.?

HAB. Sandy fields. N. J. to Geor. Aug. O.-Culm 1-2 feet

high. Spikes mostly 2, alternate, long.

17. PASPALUM. Linn.

Glume 2-valved, 1-flowered, membranaceous, equal, closely pressed to the two plano-convex palex. Seed coated with the palex.—Flowers in unilateral spikes. Triandria. Digynia.

1. P. ciliatifolium Mich.: culin decumbent; leaves hairy and ciliate; sheaths hairy; spikes 1—2, rather lax, indistinctly 3-rowed.—P. ciliatum Pursh.

HAB. Sandy fields. N. Y. to Car. Sept. 21.—Culm 18 inches long, slender and simple. Spike mostly solitary, terminal.

2. P. setaceum Mich.: culm erect; leaves and sheaths villous; spike mostly solitary; flowers in 2 rows.—P. pubcscens Mull.

HAB. Sandy fields. N. Y. to Car. July. ②.—Culm 1-2 feet high. Spike on a long terminal peduncle.

3. P. luve Mich.: erect, very smooth; leaves short, very smooth; spikes numerous, (3-6,) alternate; flowers 2-rowed, smooth.

Hab. Dry meadows. Penn. to Car. Aug. 24.—Culm 1—2 feet high. Spikes spreading.

4. P. stoloniferum Bosc: spikes in elongated racemes, somewhat verticillate, spreading; flowers serrulate-ciliate, transversely rugose; leaves short, subcordate; culm prostrate at base.

HAB. Cedar swamps. N. J. Aug. 21.—Culm 2 feet long, branched, geniculate, stoloniferous. Spikes very numerous, (30—50.)

18. CENCHRUS. Linn.

Involucre 1—3-flowered, many-parted, bristly without, finally hardened. Glume 2-flowered, 2-valved; outer valve smallest. Florets dissimilar; the outer sterile, the other perfect. Scales none. Triandria. Monogynia.

1. C. cchinatus Linn.: spikelets approximated; involucres 10-parted, villous.

2. C. tribuloides Linn.: spike with alternate spikelets; involucres entire, spiny.

IIAB. Sandy soils. N. J. to Flor. July, Aug. @.—Culm 18 inches high.—Dr. Torrey thinks it a variety of the preceding.

19. TRIPSACUM. Linn.

Monoccious. Sterile Fl. Glume 2-flowered; outer one sterile; inner neuter. Corol a membranous glume. Fertile Fl. Glume 1-flowered, surrounded by a 1-leaved involucre, perforated near the base. Corol a 2-valved glume. Styles 2. Seed 1.

Monoccia. Triandria.

T. dactyloides Linn.: spikes 3, clustered; sterile florets near the top, fertile at the base.

b. monostachyon Torr.: spike solitary.—T. monostachyon Willd.
Hab. Meadows. N. Y. to Car. W. to Ill. Aug. 21.—Culm
5—7 feet high. Spikes large.

DIV. III. STIPACEE. Inflorescence panicled. Spikelets solitary, 1-flowered. Glumes membranous, the lower palex coriaceous, bearded, enfolding the upper, which has not two keels.

20. STIPA. Linn.

Glume 2-valved, membranous. Palex 2, coriaceous, shorter than the glume; the lower involute, with a long beard at the apex; upper entire. Awn jointed at the base, deciduous. Seed furrowed.—Panicle almost simple, lax.

Triandria. Digynia.

S. avenacea Linn.: leaves setaceous; panicle spreading, somewhat secund; branches mostly in pairs, a little divided; glume as long as the seed; awn naked.—S. barbata Mich.

Hab. Sandy soils. N. Y. to Car. June. 21.—Culm 2 feet high. Panicle 4—6 inches long, becoming diffuse. Feather Grass.

DIV. IV. BROME E. Inflorescence panicled. Spikelets solitary, 2 or many-flowered. Glumes with a keel. Palea of nearly the same texture as the glumes, the lower carinate or concave, always bearded, the upper with two keels.

21. ARISTIDA. Linn.

Glume 2-valved, membranous, unequal. Palea 2, pedicellate, subcylindric; lower one coriaceous, involute, 3-awned at the tip; upper one very minute or obsolete. Scales collateral.—Panicles contracted. Triandria. Digynia.

1. A. dichotoma Mich.: cespitose; culm dichotomous; flowers racemose-spiked; lateral awns very short, the intermediate one contorted.

HAB. Gravelly soil. N. Y. to Car. July. 3.?—Culms 12—18 inches high, very slender. Racemes on clavate peduncles.

2. A. stricta Mich.: culm and leaves straight, erect; leaves pubescent; raceme long, somewhat spiked, crowded; awns twice as long as the paleæ, spreading.

Hab. Rocky places. Penn. to Car. July. 24.—Culm 2—3 feet high, branching at base. Paniele long, with the flowers not crowded.

3. A. purpurascens Poir.: culm filiform, erect, simple; leaves very narrow, flat; flowers in a long spiked panicle; awns nearly equal, twice the length of the paleæ, divaricate.—A. racemosa Muhl.

Hab. Sandy woods. N. S. Sept. 21.—Culm 2—3 feet high. Panicle elongated, loose.

22. CALAMAGROSTIS. Roth.

Glume 2-valved, 1-flowered; valves acute or acuminate.

Paleæ 2, mostly shorter than the glume, surrounded with a pubescence or long wool at the base; the dorsal one with or without an awn.

Triandria. Digynia.

1. C. mexicana Nutt.: panicle oblong, loose; glumes scabrous, pubescent, as long as the paleæ, which are awned on the back; hairs at the base equalling the paleæ; culm and leaves smooth.—Arundo canadensis Mich. Torr.—A. cinnoides Muhl.—A. agrostoides Pursh.

HAB. Bogs. N. S. W. to Mich. Aug. 21.—Culm 3 feet or more high. Leaves long and narrow. Panicle erect, much di-

vided.

- 2. C. colorata Nutt.: panicle oblong, spiked; glumes boat-shaped, serrulate; palew unequal; rudiments hairy.—Phalaris americana Ell. Torr.—P. arundinacea Mich. Muhl.
 - HAB. Bogs. Can. to Car. Aug. 24.—Culm 3—5 feet high. Panicle at length somewhat spreading.
- 3. C. canadensis Nutt.: panicle somewhat spiked, conglomerate; glumes a little longer than the paleæ, carinate; paleæ longer than the pappus, awned a little below the tip.—Agrostis coarctata Torr.—A. glauca Muhl.

Hab. Bogs. N. S. N. to Subarc. Amer. July, Aug. 21.— Culm 3-5 feet high. Panicle stiffly erect.

4. C. brevipilis Beck: panicle diffuse, capillary; glumes unequal, shorter than the palew, bearded at the base; palew equal, awnless, hairy; pappus very short.—Arundo brevipilis Torr.—A. epigeios Muhl.

HAB. Sandy swamps. N. Y. and N. J. Sept. 21.-Culm 3-4

feet high. Panicle pyramidal, loose.

5. C. halleriana De Cand.: panicle loose, glumes acuminate; dorsal awn and hairs longer than the palew, but shorter than the glume.

—Arundo pseudo-phragmites Schrad.

HAB. N. S. Schweinitz.

6. C. confinis Spreng.: panicle lanceolate, spreading; glumes nerved, acuminate; hairs equalling the palew; dorsal awn geniculate, longer than the glumes.—Arundo confinis Willd. Pursh.

HAB. Bethlehem. Penn. Schweinitz.

23. PSAMMA. P. de Beauv.

Glumes 2-valved, awnless. Paleæ 2, shorter than the glumes, surrounded with hairs at the base. Scales linear-lanceolate, longer than the seed. Style 3-parted. Stigmas 3.—Panicle spiked. Triandria. Trigynia.

P. arenaria P. de B.: panicle spiked; glumes acute; paleæ three times as long as the pappus; leaves involute.—Arundo arenaria Linn. Hab. Sandy shores. Can. and N. S. Aug. 2f.—Roots long.

creeping. Culm 2-3 feet high. Panicle white.

24. ANTHOXANTHUM. Linn.

Glumes 2-valved, 3-flowered. Lateral florets imperfect, with one palea bearded; intermediate florets perfect, much shorter than the lateral ones. Palex obtuse, beardless. Stamens 2. Seed free.—Panicle contracted.

Diandria. Digynia.

 $A.\ odoratum\ Linn.$: spike ovate-oblong; flowers pubescent, subpeduncled, shorter than their awns.

Hab. Moist meadows. N. Y. to Car. June—Aug. 24.—Culm a foot high, assurgent. Flowers in a terminal spike or spiked paniele. Introduced. Sweet-secreted Vernal Grass.

25. AIRA. Linn.

Glumes 2- rarely 3-flowered, beardless, 2-valved, equal to the florets or shorter; one of the florets peduncled. Palex 2, equal, enclosing the seed when ripe; outer one usually awned.—Panicle compound.

Triandria. Digynia.

1. A. flexuosa Linn.: paniele spreading, triehotomous; branches flexuous; glumes a little shorter than the paleæ and about the length of the awn; leaves setaeous; culm nearly naked.

HAB. Shady woods. Can. to Car. W. to Mich. June. 21.— Culm 1—2 feet high. Panicle capillary, lax, the branches whorl-

ed or dichotomous.

2. A. cespitosa Linn.: paniele diffuse; palcæ about the length of the glumes; awn short, straight; leaves flat.

HAB. Swamps. Can. and N. S. July. 24.—Culms eespitose, 18 inches high. Panicle eapillary, with the branches somewhat whorled.

3. A. aristulata Torr.: paniele capillary, spreading; branches verticillate and flexuous; glumes 2-flowered, shorter than the paleæ; upper floret pedicellate; lower paleæ truncate, laciniate, with an awn a little below the middle searcely exserted.

HAB. Shores of lakes. N. Y. Aug. 21.—Culm 2 feet high. Paniele oblong or pyramidal.

4. A. pumila Pursh: panicle small, fastigiate, few-flowered; pedicels short; paleæ awnless, obtuse, twice the length of the glumes, with membranous margins; leaves flat, smooth; culm erect, scarcely longer than the leaves.

HAB. Clay grounds. Penn. Pursh. June. 21.—Culms scareely an inch high, growing in tufts.

26. AVENA. Linn.

Glumes membranous, 2—7-flowered, longer than the florets. Lower palea bilaciniate, or with the upper bifid-toothed,

sometimes eroded, with a twisted awn on the back. Scales ovate. Seed coated, furrowed.—Panicle compound, loose.

Triandria. Digynia.

1. A. pracox P. de B.: paniele in a dense raceme; florets as long as the glumes; awn exserted; leaves setaceous.—Aira pracox Linn.

HAB. Sandy fields. N. J. to Vir. June. ②.—Culm 3—4 feet high, cespitose. Panicle oblong.

2. A. elatior Linn.: paniele equal, nodding; awn as long again as the floret; eulm geniculate, smooth; root nodose.—Arrhenatherum avenaceum P. de B. Torr.

HAB. Fields. N. S.; rare. June. 21.—Culm 3 feet high. Panicle loose, with the branches in pairs or ternate.

27. TRISETUM. Pers.

Lower palea with 2 bristles and a tender flexuous beard above the middle of its back. Scale lanceolate.—(Other characters of Avena.)

Triandria. Digynia.

1. T. pennsylvanicum P. de B.: panicle attenuated; awn twice as long as the florets; seed villous.—Avena pennsylvanica Linn.—Arrhenatherum pennsylvanicum Torr.

HAB. Fields. N. Eng. to Car. July. Q .- Culm erect, smooth. Punicle with short branches.

2. T. palustre Torr.: panicle contracted, nodding, somewhat verticillate; glumes 2-3-flowered; florets smooth, acuminate; lower one awnless; lower palea of the upper floret bicuspidate, awned below the tip.—Arcna palustris Mich.—Aira pallens Muhl.

HAB. Wet meadows. N. Y. to Flor. May-July. 21.—Culm 1—2 feet high. Panicle with the lower branches in fives.

3. T. purpurascens Torr.: paniele very simple, somewhat racemose, few-flowered; glumes 3-flowered, very unequal, entire; culm and leaves smooth; stipule very short, truncate.—Acena striata Mich.?

HAB. Mountain meadows. Can. and N. S.
 2 feet high, leafy. Leaves narrow-linear. Panicle 4-6 inches long. Glumcs purplish, smooth.

4. T. subspicatum Brown: panicle subspiked; awn at length deflexed, exceeding the glume.—T. aroides P. de B. Torr.—Aira subspicatu Linn.

Hab. Rocks and mountains. Little Falls, N. Y. Gray. White Mountains, N. H. Rocky Mountains. Are. Amer. June. 21. — Culm a foot high. Leaves narrow, 2—4 inches long. Paniele 2 inches long, somewhat spiked.—First noticed as an American plant by Dr. Torrey, in Ann. N. Y. Lyc. i. 154. The specimens which I have received from Dr. Gray, agree exactly with those from the White Mountains, collected by Dr. Pickering, but they are nearly three times the size of my specimen of A. subspicata, from Switzerland; the paniele also is more loose and the glumes of a lighter colour.

28. HOLCUS. Linn.

Glumes 2-valved, 2-flowered, nearly equal. Palex 2. Florets dissimilar, polygamous, one awned, the other awnless, without any imperfect one between them.—Panicles contracted.

Triandria. Digynia.

H. lanatus Linn.: perfect floret inferior and awnless; sterile one with a curved awn included in the glume; root fibrous.

Hab. Wet meadows. N. S. W. to Mich. July. 2f.—Culm 18 inches high. Panicle oblong, contracted, whitish.

Soft Grass.

29. HIEROCHLOA. Gmcl.

Glumes 2-valved, 3-flowered, scarious. Lateral florets antheriferous, triandrous. Central floret perfect, diandrous, (rarely triandrous.)—Panicle contracted, ovate.

Triandria. Digynia.

1. H. borcalis R. & S.: panicle subsecund, a little spreading; peduncles smooth; florets unarmed; lower palea ciliate on the margin; root creeping.—Holcus odoratus Linn. Mich.—H. fragrans Pursh.

HAB. Wet meadows. Can. to Vir. N. to Subarc. Amer. May.
21.—Culm 18 inches high. Panicle few-flowered, pyramidal,

purple and brown. - Sweet-scented.

2. H. alpina R. & S.: panicle ovate, contracted; spikelets compressed, longer than the branches; glumes lanceolate, almost nerveless; lateral florets triandrous; one of them with an awn about as long as the valves; sides almost smooth; margin ciliate.

HAB. Summit of White Hills, N. H. Big. N. to Arc. Amer. June. 24.—Culm 6—8 inches high. Flowers larger than in the

preceding, purple.

30. URALEPSIS. Nutt.

Glumes 2—3-flowered, much shorter than the florets, which are stipitate and distinct. Paleæ 2, very unequal, distinctly villous on the margins; the lower one tricuspidate; the central cusp produced into a short bristle; upper palea concave on the back and incurved. Seed gibbous, coated.—Panicle simple, racemose.

Triandria. Digynia.

U. aristulata Nutt.: lateral panicles concealed in the sheaths of the leaves; terminal ones partly exsert; glume 3-flowered; bristle of the palea as long as the lateral cusps.

terminal, purple.

31. ARUNDO. Linn.

Glume naked, beardless, 2-valved, unequal. Palex membranous, surrounded with bristles at the base; lower one mucronate or slightly awned. Seed enclosed in the palex.

Triandria. Digynia.

A. phragmites Willd.: glumes about 5-flowered, a little shorter than the florets.—Phragmites communis Trin. Torr.

HAR. Near ponds. N. Y. to Geor. Aug. 21.—Culm 6—12 feet high, with numerous joints. Panicle very large, loose, somewhat nodding. At a distance resembles Indian corn.

Reed Grass.

32. DANTHONIA. De Cand.

Glumes 2—5 flowered, longer than the florets, cuspidate. Paleæ bearded at the base; lower one 2-toothed, with a twisted awn between the teeth; upper one obtuse, entire.—Panicle spiked.

Triandria. Digynia.

D. spicata P. de B.: panicle simple, appressed; spikelets 7-9, about 7-flowered; lower palea hairy; leaves subulate; lower sheaths hairy at the throat.—Avena spicata Linn.

HAB. Woods and fields. Can. to Car. W. to Mich. June—Aug. 21.—Culms cespitose at base, 1—2 feet high. Panicle spiked.

33. FESTUCA. Linn.

Glume 2-valved, many-flowered; valves unequal. Paleæ 2, lanceolate; outer one acuminate or awned at the extremity.

Panicle generally compound. Triandria. Digynia.

1. F. myurus Linn.: panicle slender, crowded, equal; spikelets about 4-flowered; florets subulate, awned, hairy, monandrous.

HAR. Dry fields. N. J. to Car. June. ©.—Culm 6—8 inches high, geniculate at base. Aun twice as long as the palea.

2. F. tenella Willd.: panicle spiked, very simple, secund; spikelets mostly 9-flowered; bristles shorter than the subulate florets; culm filiform, angular above; leaves setaceous.—S. bromoides Mich.

Hab. Sandy fields. N. Y. to Car. June. @.—Culms numerous, 8—12 inches high. Panicle racemose or spiked.

3. F. duriuscula Linn.: panicle secund, oblong, contracted; spikelets 5—6-flowered, nearly terete; florets terminated by short bristles; root fibrous.

HAB. Fields and pastures. N. Y. to Car. June. 21.—Culm 12—18 inches high. Panicle with geminate branches, Introduced.

4. F. rubra Linn.: panicle secund, erect, spreading; spikelets some-

what terete; florets longer than the bristle at their tips; leaves pubescent above; root ereeping.

HAB. Dry soils. Penn. Muhl. June. 21.—Culm 18 inches high, erect. Leaves very long. Paniele contracted.

5. F. elatior Linn: panicle spreading, much branched, loose; spikelets ovate-lanceolate, 4—5-flowered; florets slightly armed; leaves flat: root creeping.

Hab. Wet meadows. N. S. June. 21.—Culm 3-4 feet high. Panicle 6-8 inches long, nodding when old.

6. F. pratensis Huds.: paniele spreading, branched; spikelets linear, many-flowered, acute; leaves linear; root fibrous.

Hab. Meadows and fields. N. S. June, July. 21.—Culm 1—2 feet high, creet. Panicle subsecund, nearly simple. Introduced.

7. F. nutans Willd.: paniele, diffuse, at length nodding; branches long, geminate, naked below; spikelets ovate, 3—5-flowered; florets somewhat obtuse, unarmed, nerveless.

HAB. Woods and hills. N. J. to Car. W. to Mich. June. 21.—Culm 3 feet high. Paniele few-flowered, loose.

8. F. fascicularis Willd.: culm procumbent, geniculate; panicle subsecund; branches straight, spike-like; spikeleis appressed, 8—10-flowered; florets armed; leaves very long.—F. polystachia Mich.—F. procumbens Muhl.

9. F. clandestina Muhl.: panicle partly concealed in the sheaths; branches solitary, simple; spikelets 10-flowered; florets awned.

HAB. N. Y. Muhl.—Culm about 8 inches high. Leaves linear. Spikelets sessile and peduneled. Lower palea with a short bristle.

10. F. diandra Mich.: panicle close; branches simple, scattered; spikelets linear, 2—5-flowered; flowers acuminate, diandrous; stem very rough.—Diarrhena americana P. de B. Torr.

HAB. Banks of the Ohio. Raf. 21.—Culm erect, nearly naked, slender. Paniele racemose.

11. F. glabra Spreng.: panicle spreading, with the branches secund; spikelets awnless, 6-flowered; leaves somewhat rigid and with the cheaths very smooth.

HAB. Long Island. N. Y. Spreng. Schweinitz.

34. CERATOCHLOA. P. de Beauv.

Glumes 12-18-flowered; valves shorter than the florets. Paleæ bifid-toothed; the lower one mucronate between the teeth. Seed coated, furrowed, 3-horned.—Panicle nearly

simple. Spikelets compressed. Florets imbricated in 2 rows.

Triandria. Digynia.

C. unioloides P. de B.: panicle nodding, spreading; spikelets oblong-lanceolate, compressed, 6—8-flowered; florets acuminate, unarmed; sheaths bearded at the throat, the lower one hairy; root fibrous.—Festuca unioloides Willd.

IIAB. Fertile soils. Penn. to Car. July.

or 24.—Culm 18 inches high. Paniele small; branches in pairs.

35. DACTYLIS. Linn.

Spikelets heaped into a unilateral head. Glume 2-valved, many-flowered; valves unequal, the larger one keeled. Paleæ 2, lanceolate, awnless; lower one emarginate, mucronate; upper bifid, toothed.—Panicle compound.

Triandria. Digynia.

D. glomerata Linn.: panicle secund, glomerate; leaves carinate.

11 AB. Fields and meadows. N. Y. to Car. June. 24.—Culm
2—3 feet high. Panicle secund. Spikelets in thick ovate clusters on the branches.

Orchard-grass.

36. TRICUSPIS. P. de Beauv.

Spikelets terete, tumid, many-flowered. Glume 5—7-flowered, carinate, shorter than the florets. Lower palea bifidtoothed, between the teeth and on each side mucronate; upper one truncate, almost emarginate. Seed 2-horned.—Panicle compound.

Triandria. Digynia.

T. sesterioides Torr.: panicle expanding and flexuous; spikelets all pedunculate, about 6-flowered, lanceolate; lower palea ovate, 5-toothed.—Poa sesterioides Mich. Mull.—Windsoria poeformis Nutt.

HAB. Sandy fields. N. S. S. to Car. Aug. 21.—Culm 4-5 feet high, erect, smooth. Paniele very large, at length spreading and pendulous. Red-top.

37. KOELERIA. Pers.

Spikelets compressed. Glume 2—3-flowered, beardless, 2-valved; valves shorter than the lowest floret. Paleæ 2, the outer beardless or bearded under the point.—Panicle spiked.

Triandria. Digynia.

1. K. pennsylvanica De Cand.: leaves flat and with the sheaths softly pubescent; panicle oblong, slender, rather loose; glumes 2-flowered, nearly equal; the lower one oblong, obtuse, and slightly mucronate; upper palea scabrous.—Aira mollis Muhl.

Hab. Rocky woods. Penn. to Car. May, June. 21.—Culm 2 feet high, simple. Panicle long, with shining flowers.

2. K. truncata Torr.: leaves flat, smooth; panicle oblong, racemose; glumes 2-flowered, with a third abortive floret, unequal; lower glume a little scabrous, obtuse; paleæ smooth.—Aira truncata Muhl.—Holcus striatus Linn.

b. major Torr.: paniele large, a little spreading; leaves broadlinear, very long.

IIAB. Dry woods. N. Y. to Car. June. 21.—Culm 2 feet high, slender. Panicle loose, racemose.

38. BROMUS. Linn.

Glume 3—20-flowered. Valves shorter than the florets, which are imbricated in 2 rows. Lower palea cordate, emarginate below the end, sometimes torn in two, with a straight beard. Scales ovate, smooth. Triandria. Digynia.

1. B. sccalinus Linn.: panicle spreading, a little branched; spikelets oblong-ovate, compressed; florets about 10, distinct, rather remote, longer than the flexuous bristles; leaves somewhat hairy.

Hab. Cultivated grounds. Penn. to Car. June. ©.—Culm 2—3 feet high; nodes swollen, pubescent. Panicle oblong, erect, branched. Introduced. Chess or Cheat.

2. B. mollis Linn.: panicle erect, contracted; spikelets oblong-ovate, somewhat compressed, pubescent; bristle straight, as long as the paleæ; leaves very soft pubescent.

HAB. Fields and pastures. N. Y. and Penn. June. &.—Culm 2 feet high, pubescent. Panicle 3—4 inches long; spikelets

5-10-flowered.

3. B. purgans Linn.: panicle nodding; spikelets lanceolate, terete; florets hairy; bristle straight; leaves smooth; sheaths hairy.

HAB. Wet meadows. Can. to Car. N. to Arc. Amer.; rare. Aug. 24.—Culm 2—4 feet high. Panicle diffuse with scabrous and flexuous branches.

4. B. ciliatus Linn.: panicle nodding; spikelets oblong, terete, 8—10-flowered; glumes acute, (not mucronate,) ciliate; paleæ hairy; margin villosely ciliate; bristle short.

HAB. River banks. Penn. to Car. June. 24.—Culm 3 feet high, hairy at the joints. Panicle nodding, with 2 bracts at base.

5. B. pubescens Muhl.: panicle at length nodding; spikelets lanceolate, terete; florets pubescent; leaves and lower sheaths pubescent.

HAB. Woods. Penn. Muhl. June. 21.—Culm 4 feet high, erect. Panicle scabrous with 2—5 branches.

39. POA. Linn.

Spikelets oblong or linear, compressed, many-flowered, (3-20.) Glumes shorter than the florets. Palex sometimes

woolly at the base, the upper bifid-toothed. Scales smooth.

—Panicle more or less branching or scattered.

Triandria. Digynia.

- 1. P. annua Linn.: panicle subsecund, divaricate; spikelets ovateoblong, 5-flowered; florets free; culm oblique, compressed; root fibrous.
 - HAE. Fields, &c. Can. to Car. April—Aug. @.—Culms cespitose, 6—8 inches long, very smooth. Paniele crowded, at length spreading.

 Meadow Grass.
- 2. P. fasciculata Torr.: panicle expanding; branches straight, fasciculate, crowded; spikelets oblong, 3-flowered; florets frees; glumes minute, unequal; culm oblique, terete; root fasciculate.
 - Hab. Salt marshes. N. Y. Aug. 24.—Culm 1--2 feet high. Panicle appressed.
- 3. P. dentata Torr.: panicle loose, somewhat spreading; branches capillary, virgate; spikelets lanceolate, 5-flowered; glumes free; florets unequal; inferior glume obtuse, 3-nerved; lower palea 5-nerved, 5-toothed at the apex when old.

Hab. Swamps. N. S. June, July. 21.—Root creeping. Culm 3 feet high. Panicle large, nodding when young.

- 4. P. aquatica var. americana Torr.: panicle erect, semi-verticillate, diffuse; branches flexuous, smooth; spikelets linear, 6—8-flowered; florets ovate, obtuse, free; leaves broad-linear, and as well as the sheaths, smooth.—P. aquatica Pursh.
 - HAB. Wet meadows. Can and N. S. Aug. 21.-Culm 4--5 feet high, thick and leafy. Panicle very large, purple.
- 5. P. maritima Huds.: panicle branched, somewhat crowded; spikelets about 5-flowered, terete; florets rather obtuse, indistinctly 5-nerved; root creeping.
 - HAB. Salt marshes near Boston, Mass. Big. June. 21.—Culm a foot high. Panicle erect, with the branches in pairs and flexuous.
- 6. P. brevifolia Muhl.: panicle loose; branches in pairs, horizontal; glumes 3—4-flowered; paleæ pubescent; leaves very short; stipules, acuminate.

HAB. Woods. Penn. Muhl. April: 21.—Culm 2 feet high, oblique and somewhat angular. Paniele loose, flexuous.

- 7. P. pungers Torr.: culm compressed; leaves very short, cuspidate; panicle somewhat simple, spreading; spikelets ovate, 3-4-flowered; florets webbed, rather obtuse, obscurely 5-nerved.—P. flexuosa Muhl.
 - HAB. Rocky woods. Penn. April. 24.—Culm 18 inches high, subancipitous. Panicle small, semiverticillate.
 - 8. P. pratensis Linn.: panicle diffuse; upper leaves much shorter 35

than the smooth sheaths; florets acute, 5-nerved, webbed at the base; stipule short, truncate; root creeping.

HAB. Meadows. Penn. to Car. May-July. 21.-Culm 2-3 feet high. Paniele pyramidal, spreading. Introduced.

9. P. viridis Muhl.: leaves flat, linear, abruptly acute; panicle somewhat crowded; spikes ovate, acute, 4-flowered.

- HAB. Meadows. Penn. to Car. July. 21 .- Culm erect, 3 feet high, oblique at base. Paniele diffuse, with 3 or 4 branches at each joint.-Differs from the preceding in the compression and almost pungent acuteness of the gluines and paleæ, (Nutt.) but is perhaps only a variety. Green-grass.
- 10. P. parviflora Pursh: panicle diffuse, capillary; spikes small, generally 3-flowered; florets rather obtuse, striate, caducous; leaves distichous, flat.
 - HAB. Shady woods. N. Y. to Car. July. 21.-Culm decumbent 12-18 inches high, somewhat compressed. Leaves very smooth. Florets 1-4.
- 11. P. conferta Ell.: panicles terminal and axillary, erect, compressed, with the florets clustered; spikclets 8-flowered, smooth.-P. glomerata Walt.
 - HAB. Penn. Schweinitz. S. to Car. 21.—Culm erect, geniculate, 2-3 feet high. Leaves smooth, flat, serrulate on the margin. Panicles 4-8 inches long.
- 12. P. trivialis Linn. : panicle equal, diffuse ; spikelets oblong-ovate, about 3-flowered; florets webbed at the base, 5-nerved; culm and sheaths roughish; stipule oblong; root creeping .- P. stolonifera Muhl.

HAB. Wet meadows. N. S. June-Aug. 21.-Culm 2-3 feet high. Paniele large, pyramidal, whorled.

13. P. compressa Linn: panicle contracted, somewhat secund; spikelets oblong, 3-6-flowered; florets webbed; glumes nearly equal; culm oblique, compressed; root creeping.

b. sylvestris Torr.: panicle loose, spreading; spikelets 2-3-flowered; culm slender, nearly erect.

HAB. Fields and woods. N. S. June, July. 21.-Root creeping. Culm procumbent or geniculate. Panicle almost spiked.

Blue-grass.

- 14. P. scrotina Ehrh: panicle elongated, diffuse, at length somewhat secund; spikelets ovate-lanceolate, 2-3-flowered; florets a little webbed at the base, yellow at the tip, obscurely 5-nerved; root creeping .- P. palustris Muhl.
 - Hab. Wet meadows. N. S. June. 24.—Culm 2—3 feet high, erect. Panicle much branched. Red-top.
- 15. P. nemoralis Linn.: panicle attenuated, weak; branches flexuous; spikelets ovate, about 3-flowered; florets loose, slightly webbed, acute, obsoletely nerved; stipule almost wanting.

HAB. Woods. N. S. July. 21.-Culm 2 feet high. Panicle with capillary branches.'

- 16. P. nerrata Willd.: panicle equal, diffuse; branches weak, and at length pendulous; spikelets 5-flowered; florets free, conspicuously 7-nerved, obtuse.—P. striata Mich.—Briza canadensis Nutt.
 - Hab. Wet meadows. N. S. June. 21.—Culm 3—4 feet high. Panicle large, with ovate spikelets.
- 17. P. elongatu Torr.: panicle elongated, racemose; branches solitary, appressed; spikelets ovate, obtuse, tumid, 3-flowered; florets free; stipules almost wanting.

HAB. Wet meadows. N. S. July. 24.—Culm 3 feet high.

Panicle 8-10 inches long, nodding.

- 18. P. obtusa Muhl.: panicle ovate, contracted; spikelets ovate, tumid, 5—7-flowered; florets free; glumes scarious; paleæ ovate, smooth, obtuse; lower one indistinctly 7-nerved; leaves as long as the culm, and with the sheaths smooth.
 - HAB. Swamps. N. S. Aug., Sept. 21.—Culm 3—4 feet high. Panicle dense, many-flowered.
- 19. P. çanadensis Torr.: panicle large, effuse; spikelets semi-verticillate, flexuous, at length pendulous; spikelets ovate, tumid, 5—8-flowered; florets free; lower palea somewhat acute, 7-nerved; upper one very obtuse; stamens 2.—Briza canadensis Mich.

HAB. Swamps. Can. and N. S. July, Aug. 21.—Culm 3-4 feet high. Panicle large, with the branches at length spreading.

20. P. capillaris Linn.: panicle very large, loose, expanding, capillary; spikelets 3-flowered, ovate, acute; florets free; culm branched at the base; leaves hairy.

HAB. Sandy fields. N.Y. to Car. Aug. .-Culm a foot or more high. Panicle large, pyramidal, much branched.

- 21. P. hirsuta Mich.: culm erect, compressed, simple; sheaths hairy; panicle very large, capillary; branches expanding, at length reflexed, bearded in the axils; spikelets oblong, about 5-flowered; paleæ ciliate on the margin.
 - b. spectabilis Torr.: spikelets linear, 10-15-flowered.-P. spectabilis Pursh.
 - IIAB. Sandy fields. N. S. S. to Geor. July, Aug. 21.— Culm 18 inches high. Panicle a foot long, much branched, purplish.—Var. b. is taller.
- 22. P. pectinacea Mich.: culm cespitose, oblique; leaves hairy at the base; panicle capillary, expanding, pyramidal, hairy in the axils; spikelets linear, 5—9-flowered; florets free, acute; upper palea presistent.—P. pilosa Muhl.—P. tenella Pursh.
 - HAB. Sandy fields. N. Y. to Car. July, Aug. @—Culm 8—12 inches long, geniculate at base. Panicle large, loose, purplish.
- 23. P. reptans Mich.: dioecious; culm branched, creeping; panicle fascicled; spikelets linear-laneeolate, 12—20-flowered; florets acuminate.

IIAB. Swamps. N. Y. to Car. July, Aug. @.—Culm 6—5 inches long, rooting at the joints. Paniete 1—2 inches long, with the spikelets compressed.

21. P. cragrostis Linn.: panicle equal, spreading, the lower branches hairy in the axils; spikelets linear-lanceolate, 9—15-flowered; florets obtuse; root fibrous.—P. obtusa Nutt.—Briza cragrostis Muhl.

Hab. Sandy fields, &c. N. Y. to Car. July, Aug. Θ.—Culm 12—18 inches long, geniculate and branching at base. Panicle pyramidal; branches short, flexuous.

40. GLYCERIA. Brown.

Spikelets slender. Glume 5—7-flowered; valves 2, truncate, with transparent membranous edges, shorter than the florets. Lower palea eroded or many-toothed, embracing the upper, which is bifid-toothed. Scales connate. Seed furrowed.—Panicle nearly simple. Triandria. Digynia.

1. G. fluitans Brown: panicle secund, slightly branched; spikelets linear-terete, appressed, 8-12-flowered; florets very obtuse, 7-nerved: leaves long, flat.—Festuca fluitans Linn.

Hab. Wet grounds. N. S. W. to Mich. June, July. 2f.— Root creeping. Culm 3-5 feet high, compressed or ancipitous.

Panicle nearly a foot long.

2. G. acutiflora Torr.: panicle simple, elongated, appressed; spikelets linear-terete, 4--6-flowered; florets attenuated, acute, indistinctly nerved; leaves short, erect.—Festuca brevifolia Muhl.

Hab. Overflowed meadows. N. S. Junc. 21.—Culm 18 inches high. Panicle long and slender, nodding.—Dr. Gray has found

it in Ontario county, N. Y.

41. UNIOLA. Linn.

Spikelets compressed. Florets imbricated in 2 rows, the lower only abortive. Glume 3—20-flowered, shorter than the florets. Lower palea boat-shaped at the end, abruptly cut off and mucronate between the lobes; the upper subulate, somewhat bifid-toothed. Scales emarginate. Seed with 2 horns.—Panicle compound, loose. Triandria. Digynia.

1. U. latifolia Mick.: leaves broad and flat; panicle loose, nodding; spikelets on long peduncles; florets somewhat falcate, monandrous; the lowest one abortive.

Hab. Mountains. Penn. to Geor. Aug. 21.—Culm 2—3 feet high, somewhat branching. Panicle a foot long, loose.

2. U. gracilis Mich.: panicle elongated, racemose, appressed; spikelets 3-flowered; florets spreading; straight, monandrous; the lowest one abortive.—Holcus laxus Linn.

HAB. Sandy swamps. N. Y. to Car. Aug. 21 .- Culm 3-4

feet high, slender, leafy. Panicle long, slender, with short remote branches.

3. U. spicata Linn.: panicle spiked, straight; leaves involute, distichous, spreading; spikelets 5—9-flowered; florets triandrous.—Festuca distichophylla Mich.

HAB. Salt marshes. N. J. to Car. Aug., Sept. 24.—Root creeping. Culm 18 inches high, branched at base, leafy. Pan-

icle contracted into a dense spike.

42. BRIZA. Linn.

Spikelets cordate-ovate, many-flowered. Glume shorter than the florets, which are imbricate in two rows. Paleæ ventricose; lower one cordate at base, embracing the upper, which is nearly round and much shorter. Seed beaked.—Panicle compound, loose, with pendulous branches.

Triandria. Digynia.

B. media Linn.: panicle erect; spikelets at length cordate, about 7-flowered; glume smaller than the florets.

HAB. Near Boston; naturalized. Big. Penn. Muhl. May. 24.
—Culm 18 inches high, naked above. Panicle few-flowered; branches purple.
Quaking Grass.

43. MELICA. Linn.

Glume unequal, 2—5-flowered, membranous, nearly as long as the florets, of which the upper are incomplete and abortive. Scales truncate, fimbriate. Seed loose, not furrowed.—Panicle simple or compound.

Triandria. Digynia.

M. speciosa Muhl.: smooth; paniele loose, erect, few-flowered; branches simple; florets obtuse.—M. glabra Mich.

HAB. Mountains. Penn. to Car. June. 21.—Culm 3—4 feet high. Panicle subsecund, with solitary branches. Mclic Grass.

DIV. V. CHLORIDEE. Inflorescence spiked. Spikelets solitary, seldom many-flowered, with the upper flower abortive and differently formed. Glumes with a keel, not opposite. Lower paleæ generally bearded, seldom beardless, the upper with two keels.

44. CYNODON. Rich.

Spikelets 1-sided, in a simple row. Glumes membranous, persistent, shorter than the florets and only embracing them at the base. Fertile floret with the upper palea bifid-toothed. Rudiment minute, pedicellate. Scales truncate. Seed loose, not furrowed.—Spike digitate, with filiform spikelets.

Triandria. Digynia.

C. dactylon Pers.: culm creeping; spikes digitate, (4-5,) spreading; keel of the glume scabrous; leaves hairy on the margin and towards the base; sheaths hairy.—Digitaria dactylon Ell. Muhl.

HAB. Low grounds. Penn. to Car. Aug. 21.—Culm prostrate, a foot or more long. Leaves narrow, somewhat distichous.

Bermuda Grass.

45. ATHEROPOGON. Muhl.

Spikes in a unilateral raceme. Glume 2-valved, membranous, 2-flowered; lower one setiform. Perfect Fl. Palea 2; lower one 3-toothed, or 3-bristled; upper bifid. Abortive Fl. Palea 2—3-bristled, pedicellate.

Triandria. Digynia.

A. apludoides Muhl.: spikes racemose, distant, pendulous; perfect floret with the lower palea tricuspidate; lateral bristles in the abortive floret half the length of the terminal one.—Chloris curtipendula Mich.

Hab. Rocky hills. N. J. and Penn. W. to Rocky Mountains.

Aug. 24.—Culm 18 inches high, geniculate at base, assurgent. Spikes very numerous, secund.—Well figured by Dr. Darlington in his Flora Cestrica.

46. ELEUSINE. Gart.

Glume 5—7-flowered; valves obtuse, unequal. Palex obtuse, membranous, upper one bifid-toothed. Scales truncate, fimbriate. Seed enclosed in a separate membrane, broadly and deeply furrowed.—Spikes digitate, I-sided.

Triandria. Digynia.

E. indica Lam.: spikes straight, erect, in pairs or quaternate; rachis linear; spikelets lanceolate, about 5-flowered; culm compressed, declined.—Cynosurus indica Linn.

Hab. Cultivated grounds. N. Y. to Car. July—Nov. Q.— Culm 1—2 feet high, decumbent. Spikes mostly in pairs.

Wire Grass.

DIV. VI. CEREALIE. Inflorescence spiked. Spikelets solitary, in pairs, or several together, 1- or many-flowered. Glumes opposite, equal. Lower palea bearded or beardless, upper with two keels.

47. HORDEUM. Linn.

Spikelets 3 at each joint of the rachis, 1-flowered, all perfect, or the lateral ones abortive. Glumes 2, subulate. Palex 2, the lower bearded. Scales 2. Stigmas feathery. Seed coated.—Habit similar to Elymus. Triandria. Digynia.

II. jubatum Linn.: lateral florets abortive, neuter; bristles of the glume and paleæ 6 times as long as the flowers.

HAB. Marshes near Boston. Big. N. to Subarc. Amer. June. &.—Culm 2 feet high, simple, slender. Spikes 2 inches long.

Squirrel-tail Grass.

48. SECALE. Linn.

Spikelets in each tooth of the rachis solitary, 2—3-flowered; the 2 lower florets fertile, sessile, opposite; the upper abortive. Glumes subulate, opposite, entire, shorter than the florets. Lower palea entire, with a very long bristle; upper bifid-toothed. Scales obovate, hairy. Seed coated, furrowed.

Triandria. Digynia.

S. cereale Linn.: glumes and bristles scabrous-ciliate; paleæ smooth.

11 AB. Old fields. Junc. ⑤ or &.—Culm 3-4 feet high. Spike
4—6 inches long. Lower palea terminating in a long scabrous bristle.

Rye.

49. ELYMUS. Linn.

Spikelets 2 or more at each joint of the rachis, 3—9-flowered. Glume 2-valved, nearly equal, rarely (as in E. hystrix,) absent or nearly so. Lower palea entire, with a bristle which is sometimes very short; upper somewhat bifid-toothed. Scales ovate, hairy. Seed furrowed.—Spike simple.

Triandria. Digynia.

1. E. virginicus Linn.: spike erect, coarctate; spikelets in pairs, 2-3-flowered; florets smooth; glumes lanceolate, nerved.

HAB. River banks. N. J. to Car. W. to Mich. July, Aug. 24.—Culm 3—4 feet high, smooth. Spike thick and stiffly erect.

Lime Grass.

2. E. canadensis Linn.: spike nodding at the extremity, patulous; spikelets 3-5-flowered; florets hairy; glumes linear-lanceolate.

b. glaucifolius Torr.: leaves glaucous.—E. glaucifolius Willd.

HAB. River banks. N. S. N. to Subarc. Amer. Aug. 21.— Root creeping. Culm 3—4 feet high. Spike 6 inches long, pendulous at the extremity.

3. E. villosus Muhl.: spike a little nodding at the extremity, patulous; rachis and florets hispid-pilose; spikelets geminate, 2—3-flowered; glumes linear, pilose-ciliate, 2-nerved, shorter than the florets.

Hab. Hills. N. J. to Vir. July. 21.—Culm 2-3 feet high. Spike 3 inches long, at length incurved at the extremity.

- E. hystrix Linn.: spike erect; spikelets diverging; glumes none.
 HAB. Rocky hills. N. Y. to Car. July. 21.—Culm 3 feet high. Spike 6 inches long. Leaves often glaucous.
- 5. E. striatus Willd. : spike erect ; spikelets 2-flowered, awned, his-

pid, in pairs; glumes linear, nerved, awned, nearly as long as the

spikelets; leaves and sheaths smooth.

HAB. Shady woods. Penn. and Virg. Pursh & Schweinitz.

June. 21.—Culm erect, 8 inches high, striate. Leaves lanceolate, acuminate, scabrous above. Spike erect, somewhat spreading, with the rachis pubescent.

50. TRITICUM. Linn.

Spikelets sessile on the teeth of the rachis, many-flowered. Glumes 2-valved; valves nearly equal, beardless or with one beard enclosing the florets. Palex 2, one of them bearded from the end. Seed enclosed in the palex.—Flowers spiked.

Triandria. Digynia.

1. T. astirum Linn.: spike parallel, compressed; glumes 4-flowered, ventricose; bristles generally much longer than the florets.

HAB. Fields—naturalized. June. ©.—Culm 3—4 feet high. Spike 3—6 inches long, with the rachis jointed. Wheat.

2. T. repens Linn.: spikelets oblong, 5-flowered; glumes subulate, many-nerved; florets acuminate; leaves flat; root creeping.—Agropyron repens P. de B. Torr.

HAB. Fields. N. S. W. to Miss. July. 21.—Root white, jointed, proliferous. Culm 2 feet high. Spike 3—4 inches long.
—A troublesome weed. Couch Grass. Quack.

3. T. caninum Linn.: spikelets about 5-flowered, compressed; glumes 3-nerved, and as well as the florets armed with a bristle at the tip; root fibrous.— $Agropyron\ eaninum\ R.\ \&\ S.\ Torr.$

HAB. Del. Muhl. 2f.—Culm 2—3 feet high. Leaves flat, smooth. Spikelets sometimes 6-flowered.

4. T. cristatum Schreb.: spike oblong, compressed; spikelets opposite, compressed, distichously imbricated; about 5-flowered, smoothish, spreading; florets subulate-awned; culm erect, smooth.—Bromus cristatus Linn.

HAB. Penn. Schweinitz.

51. LOLIUM. Linn.

Spikelets sessile, to the lowest a glume of 1-valve, to the uppermost of 2 opposite valves. Lower palea with a mucro or bristle at the end; upper membranous, bifid-toothed. Scales with 2 unequal teeth. Seed furrowed.—Spike compound.

Triandria. Digynia.

1. L. perenne Linn.: floret much longer than the glume, unarmed, linear-oblong, compressed; root perennial.

Hab. Meadows, &c. N. S. May, June. 21.—Root creeping.

Culm 18 inches high, smooth. Spike 6 inches long, with the

spikelets 7—9-flowered.

Darnel.

2. I. temulentum Linn.: florets shorter than the glumes, as long as the bristle at their extremity; root annual; culm scabrous above.

HAB. N. Eng. and Penn. Muhl. July. @.—Culm 2 feet high. Spikelets much compressed.

52. SPARTINA. Schreb.

Flowers in unilateral spikes, imbricated in 2 rows. Glume 2-valved, compressed, unequal. Paleæ 2, awnless, unequal. Scales collateral. Triandria. Monogynia.

1. S. cynosuroides Willd.: spikes numerous (10—40,) pedunculate, panicled, spreading; leaves broad, flat, at length convolute; one glume with a short awn; style 2-cleft at the summit.—S. polystachya Muhl.—Lymnetis cynosuroides and polystachya Pursh.

HAB. Meadows. Can. to Car. Aug. 21.—Culm 4—10 feet high. Leaves 1—3 feet long. Spikes linear, scattered.

Marsh Grass.

2. S. junca Willd.: leaves distichous, convolute, spreading; spikes few, (1-3,) pedunculate; peduncles smooth; palew rather obtuse; styles 2.—Limnetis junca Pursh.

HAB. River banks and marshes. Can. to Car. July, Aug. 21.
 Root creeping, forming thick tufts. Culm 18 inches long, smooth. Spikes 3-5; lower one peduncled.

3. S. glabra Muhl.: leaves concave, erect; spikes alternate, sessile, erect, appressed; paleæ nearly smooth on the keel; style cleft about half way down.

Hab. Marshes. N. Y. to Car. W. to Miss. Aug., Sept. 21.

—Culm 3—5 feet high, smooth and somewhat succulent. Spikes
8—14, closely appressed to the rachis.

DIV VII. SACCHARINEE. Inflorescence spiked or panicled, jointed. Spikelets generally in pairs, 1 or 2-flowered, the one sessile, the other peduacled and usually monoclinous. Glumes of a stouter texture than the paleæ, neither keeled nor opposite. Paleæ very delicate and membranous, not with a keel, the lower commonly bearded.

53. ANDROPOGON. Linn.

Flowers spiked. Spikelets in pairs, polygamous; the lower one abortive, on a bearded pedicel. Glumes and palex often very minute or wanting, Upper spikelet sessile, 1-flowered, perfect. Glume subcoriaceous. Palex 2, shorter than the glume, membranous; lower one generally awned.

Triandria. Digynia.

1. A. scoparius Mich. : spike simple, lateral and terminal, peduncu-

late, in pairs; rachis hairy; abortive floret neuter; valves awned.—A.

purpurascens Muhl.

HAB. Rocky woods. N. Y. to Car. Aug. 21.—Culm 3 feet high, with lateral scattered branches, purplish. Spikes slender, flexuous. Beard Grass.

2. A. virginicus Linn.: culm compressed; superior leaves and sheaths smooth; spikes short, 2—3 from each sheath, partly concealed at the base; rachis subterete; abortive flower a mere pedicel without valves; perfect flower monandrous.—A. dissitiflorum Mich.

Hab. Swamps. Penn. to Vir. Sept. 21.—Culm 3 feet high, somewhat cespitose. Spikes partly concealed in a sheath.

- 3. A. macrourus Mich.: spikes fasciculate, in dense, lateral, and terminal fastigiate panicles; flowers monandrous; awn straight; abortive floret without valves.
 - HAB. Swamps. N. J. to Car. Sept., Oct. 21.—Culm 3 feet high, much branched towards the top. Spikes in large clustered panicles, partly concealed.
- 4. A. furcatus Muhl.: spikes digitate, generally in fours; abortive flowers staminiferous, awnless, resembling the perfect one, the awn of which is subcontorted.
 - HAB. Rocky banks of streams. N. Y. to Car. Aug., Sept. 21.—Culm 2-3 feet high. Spikes terminal, 3-4, 3 inches long.
- 5. A. nutans Linn.: panicle oblong, branched, nodding; spikelets by pairs; glume hairy, refuscent; awn contorted.—A. avenaceum Mich.

HAB. Sandy fields. N. S. to Car. Sept., Oct. 21.—Culm 3—6 feet high, simple. Panicle at first erect, at length nodding.

54. GYMNOPOGON. P. de Beaux.

Glume 2-valved, carinate, nearly equal, longer than the floret. Palea nearly equal; the lower one with a straight bristle a little below the tip. Rudiment aristiform.—Spike panicled.

Triandria. Digynia.

G. racemosum P. de B.: culm ascending; leaves distichous, cordate-lanceolate, nerved, short; flowers appressed.—Andropogon ambiguum Mich. Muhl.—Anthopogon lepturoides Nutt.

Hab. Sandy fields. N. J. to Geor. Aug. 21.—Culm 2 feet high, assurgent. Panicle large, pyramidal, somewhat verticillate.

DIV. VIII. ORYZEÆ. Inflorescence panicled. Spikelets solitary, 1-flowered. Lower paleæ cartilaginous, compressed, keeled. Stamens often more than 3.

55. LEERSIA. Linn.

Spikelets 1-flowered. Glume none. Palea 2, beardless,

keeled, compressed. Scales 2. Stigmas very finely cut. Seed loose. Triandria. Digynia.

1. L. virginica Willd.: panicle simple; the lower branches diffuse; flowers appressed, monandrous, sparingly ciliate on the keel.

HAB. Wet woods. Can. to Car. Aug. 21.—Culm 2—4 feet high, geniculate, erect or procumbent. Panicle terminal, much exsert; branches few and solitary. White Grass.

2. L. oryzoides Swartz.: panicle diffuse, sheathed at the base; flowers triandrous, spreading; keel of the glumes conspicuously ciliate.

HAB. Ditches and swamps. N. Y. to Car. Aug., Sept. 21.—
Culm 3—5 feet high, erect or procumbent at base. Punicle
much branched, spreading.
White Grass.

56. ZIZANIA. Linn.

Monoecious. Glume none. Sterile Fl. mixed with the fertile. Palex 2, subawned. Fertile Fl. Palex 2, cucullate and awned. Style 2-parted. Seed 1, enveloped in the plaited palex.

Monoecia. Hexandria.

1. Z. aquatica Lamb.: panicle pyramidal, divaricate and sterile at the base, spiked and fertile above; pedicels of the flower clavate; awns long; seed linear.—Z. clavulosa Mich.

HAB. In water. Can. to Flor. W. to Miss. Aug. 21.—Culm 4—6 feet high, jointed. Leaves broad-linear. Panicle a foot or more in length, the lower branches spreading.

Wild Rice. Water Oats.

2. Z. miliacea Mich.: panicle effuse, pyramidal; glumes with short awns; sterile and fertile florets intermixed; style 1; seed ovate, smooth; leaves glaucous.

HAB. In water. Penn. to Car. Aug. 21.—Culm erect, 6—10 feet high. Leaves very long, narrow. Flowers in a large terminal pyramidal panicle.

57. HYDROCHLOA. P. de Beaux.

Monoecious. Glume none. Sterile Fl. Palex 2, awnless. Fertile Fl. Palex 2, awnless. Stigmas 2, very long. Seed 1, reniform. Monoecia. Hexandria.

H. fluitans P. de B .- Zizania fluitans Mich. Pursh.

Hab. In water. Can. and N. S. July. 21.—Floating. Culm long, slender, branching. Leaves linear, flat. Spike solitary, axillary, setaceous, about 4-flowered.

58. ORYZOPZIS. Mich.

Glume 1-flowered, 2-valved; valves membranaceous, nearly equal, loose, obovate, awnless. Palex 2, coriaceous, cy-

lindric-ovate, hairy at the base; the lower one awned at the tip. Scales linear-elongated.—Flowers panicled.

Triandria. Monogynia.

O. asperifolia Mich.: culm nearly naked; leaves erect, rigid, pungent at the point; flowers in a racemose panicle.

HAB. Mountain meadows. N. S. N. to Subarc. Amer. April.
May. 21.—Culm 18 inches high, purple at base. Panicle very simple, flexuous.

Mountain Rice.

ORDER CXXXIX. CYPERACEÆ. Brown, Lind.

Flowers monoclinous or diclinous, consisting of imbricated solitary bracts, very rarely enclosing other opposite bracts at right angles with the first, called glumes. Perianth none, unless the glumes when present be so considered, or the hypogynous setæ. Stamens hypogynous, definite, 1—12; anthers fixed by their base, entire, 2-celled. Ovary 1-seeded, often surrounded by bristles called hypogynous setæ, probably constituting the rudiments of a perianth; ovule erect; style single, trifid or bifid; stigmas undivided, occasionally bifid. Nut crustaceous or bony. Albumen of the same figure as the seed; embryo lenticular, undivided, enclosed within the base of the albumen; plumula inconspicuous.

Roots fibrous. Stems very often without joints, 3-cornered or taper. Leaves with their sheaths entire.

DIV. I. True CYPERACE.E.

1. CYPERUS. Linn.

Spikelets compressed, distinct. Glumes imbricated in two rows, nearly all enclosing flowers. Style deciduous. Nut 1, without bristles at its base. Triandria. Monogynia.

- 1. C. tenellus Linn.: culm capillary; spike solitary and in pairs; involucre 1-leaved.—C. minimus Thurb.
 - Hab. N. J. and Penn.—This minute species has been found in Monmouth county, N. J. by Mr. Z. Collins—on the Delaware, near Philadelphia, by Dr. Isaac Cleaver. See Bart. Fl. Phil. i. 26, and Nutt. Gen. i. 35.
- 2. C. fasciculatus Ell.: spikelets ovate-oblong, many-flowered, in terminal fascicles; involucre 2-leaved, and with the leaves linear and very narrow.
 - Hab. Shores of the Delaware. Schweinitz. S. to Geor.—Culm 6 inches high, 3 angled. Leaves 1—2, almost setaceous. Spikelets 5—7, sessile, many flowered.

3. C. inflexus Muhl.: umbel 2-3-rayed, or conglomerate and simple; involucre 3-lcaved, very long; spikelets collected into ovate heads, oblong, 8-flowered; glumes squarrosc at the tip. - C. uncinatus Pursh.

HAB. Banks of streams. Ver. to Vir. Aug., Sept. & .- Culm 2-3 inches high, triquetrous. Heads consisting of many ovate spikes, yellowish.

4. C. flavescens Linn.: spikes linear-lanceolate, in fascieles of 3-4; glumes obtuse; style 2-cleft; seed lenticular; involucre 3-leaved, longer than the spikes.

HAB. Wet soils. N. Y. to Car. Aug., Sept. 2f. - Culm 8-12 inches high. Spikelets 14-20-flowered, yellowish-green.

5. C. nuttalii Torr.: culm acutely triangular; umbel radiate or nearly sessile, loose; rays short; involucre 4-leaved; 2 of the leaves very long; spikelets linear-lanceolate, compressed, acutc; stamens 2; style 2-cleft; seed oblong, obtuse, compressed.

HAR. Salt marshes. N. S. Aug., Sept. 21.—Culms cespitose. 5-12 inches high. Spikelets very acute, green and brown.

6. C. diandrus Torr.: culm slender, obtusely triangular; umbel sessile, or 1-2-rayed; involucre 3-leaved, 2 of the leaves much longer than the umbel; spikelets lanceolate-oblong, much compressed, manyflowered (14-16;) glumes margined, rather acute, keeled; stamens 2; style 2-cleft; seed oval, compressed.

HAB. Salt marshes and wet grounds. N. S. - Culm 8-12 inches high, slender. Umbel resembling a small panicle.

7. C. dentatus Torr.: umbel compound, (6-10-rayed;) involucre 3-leaved, longer than the umbel; spikelets 3 on each ray, alternate, ovate, compressed, 8-flowered; glumes acute, nervose, spreading at the points; seed triquetrous. - C. parviflorus Muhl.

HAB. Swamps and marshes. N. S. Sept. 24.-Culm 10-12 inches high. Spikelets much compressed, the tips of the glumes spreading.

8. C. erythrorhizos Muhl.: umbel decompound; involucrum 3-6leaved, very long; spikes alternate, linear, horizontal, about 12-flowcred, nearly terete; style 3-cleft; seed triquetrous.

Banks of streams. N. Y. to Geor. Aug., Sept. 21. !-Root fibrous, red. Culm a foot high. Partial umbel nearly naked. Spikelets linear, at length nearly round.

9. C. strigosus Linn.: spikelets linear, compressed, acute, alternate; glumes lanceolate, nervose; umbel simple or compound; involucre about 6-leaved, pubescent on the margin; root globose.

HAR. Wet grounds. N. Y. to Car. Aug., Sept. 24 .- Culm 2-3 feet high. Spikelets scattered, many-flowered.

10. C. tenuis Muhl: spikes lanceolate, acute, 10-17-flowered; umbel simple; involucre 3-4-leaved, longer than the rays; root tuberous.

HAB. Penn. and Vir. Muld. - Culm 8 inches high, slender. Spikelets lanceolate, many-flowered, yellow.

11. C. phymatodes Muhl.: umbel simple or decompound; involucre 3—9-leaved; 3 of the leaves very long; peduncles compressed; spikelets distichous, linear, the lower one branched, about 15-flowered; sides rather convex; glumes oblong, obtuse; radicles tuberous at the extremity.—C. tuberosus Pursh.—C. repens Ell.

HAB. Moist grounds. N. Y. and Penn. Aug. 21.—Root creeping. Culm 12—18 inches high. Leaves radical. Spikelets linear-

elongated, many flowered.

12. C. compressus Linn.: spikes digitate, somewhat by fours, lanceolate; glumes mucronate, broad, membranaceous.

HAB. Low meadows. Penn. to Car. Pursh. July. 21.—Culm 3—8 inches high. Spikelets nearly sessile, many-flowered.

13. C. virens Mich.: culm acutely triangular; umbels decompound; spikelets ovate-lanceolate, in compact heads; involucre very long.

HAB. Meadows. Penn. to Geor. Sept. 21.—Culm 1—2 feet high. Spikelcts many-flowered, laterally compressed into compact heads.

14. C. mariscoides Ell.: umbel simple, or with 1-2 rays; spikelets collected into globose heads, linear, 7-8-flowered; glumes loose, obtuse.—Scirpus cyperiformis Muhl.

Hab. Rocky grounds. Mass. to Car. W. to Miss. Aug. 2f. —Root a solid bulb. Culm 8—10 inches high. Spikelets crowd-

ed into hard dense heads.

15. C. odoratus Linn.: spikelets corymbed, subulate, remote, distichous; glumes somewhat distant; smaller umbels spreading widely, about the length of their involucels.

HAB. Banks of rivers. Penn. to Flor.; rare. Aug. 21. Pursh.

16. C. flavicomis Mich.: culm triquetrous; umbel compound; spikes linear-lanceolate, 7-flowered; glumes obtuse; involucre very long, reflexed.

Hab. Boggy woods. Penn. to Car. Pursh. July. 21.—Culm erect, smooth. Spikes distichous, oblong, compressed, yellow.

2. DULICHIUM. Rich.

Spikes somewhat racemose, axillary; spikelets linear-lanceolate, rather compressed. Glumes distichous, sheathing. Style very long, bifid; base persistent. Nut with bristles at the base.

Triandria. Monogynia.

D. spathaccum Pers.: culm terete; leaves spreading in three directions; spikelets spreading.—Schanus spathaccus Linn.—Scirpus spathaccus Mich.

Hab. Swamps and ponds. Throughout the U.S. Aug. 21. — Culm 18 inches high, round below, triangular above. Leaves linear, flat. Flowers in subulate spikelets, forming axillary racemes.

3. KYLLINGIA. Linn.

Flowers distinct, disposed in a roundish, sessile, subimbricated spike. Glumes 2-valved, 1-flowered. Palea 2, longer Triandria. Monogynia. than the glumes.

K. monocephala Linn.: stem filiform, 3-angled; head globose, sessile;

involucre 3-leaved, very long.

HAB. N. J. to Geor. June. 21.—Root creeping, stoloniferous. Culm 3-12 inches high. Head always single.—Supposed to be distinct from the foreign plant.

DIV. H. SCIRPEE.

4. FIMBRISTYLIS. Vahl.

Spikelets imbricated in all directions, all fertile, at length caducous. Style bulbous at base, jointed, ciliate. Stigmas 2-3. Seed naked at base. Triandria. Monogynia.

- 1. F. ferruginea Vahl.: culm compressed, scabrous above; involuere unequally ciliate; spikes lanceolate, acute, nearly terete; glumes pubescent .- F. puberulum Vahl. Pursh .- Scirpus ferrugineus Linn. Muhl. Torr.
 - IIAB. Wet meadows. N. Y. to Car. Aug. 2f.—Culm 2 inches to 2 feet high, varying with the soil. Umbel mostly simple, 3—4 rayed. Style 2-cleft, fimbriate. Seed naked at base.
- 2. F. spadicea Vahl.: culm compressed, nearly naked, umbel terminal; involucre rigid, 2 leaved, one of the leaves longer than the umbel; leaves subterete; spikes ovate-oblong, terete.—Scirpus spadiceus Linn. Muhl. Torr.
 - Hab. Salt marshes. N. J. to Car. Aug. 21.—Culms cespitose, 2—3 feet high, compressed above. Spikes closely imbricate, brown. Style 2-cleft, distinctly fimbriate. Seed yellowish.
- 3. F. coarctata Schw.: culm filiform; umbel compound, crowded; spikes small, linear-lanceolate; involucre setaceous, with one of its leaves longer than the umbel; leaves filiform, concave on one side. -Scirpus coarctatus Ell.-S. castaneus Muhl.

Hab. Sandy soils. N. J. Schweinitz. S. to Car. Sept. 24.— Culm filiform, a foot high. Umbel 3—4-rayed. Glumes with a short fringe on the margin. Style dceply 3-cleft.

4. F. cylindrica Vahl.: spikes cylindric, very obtuse; involucre about 1-leaved, rigid, as long as the simple umbel.

HAB. Quaker's Bridge, N. J. Schweinitz. 21.

5. SCIRPUS. Linn.

Glumes imbricating the spike on all sides, one or two of the outer ones occasionally without flowers. Seed or nut naked. or with bristles at its base. Triandria. Monogynia.

- * Seed with bristles or hypogynous seta at the base.
 † Spikes terminal, solitary.
- 1. S. palustris Linn.: culm terete, inflated; spike oblong-lanceolate; glumes somewhat obtuse; seed roundish, punctate and rugose; bristles scabrous.
 - HAE. Marshes and low meadows. N. Y. to Car. N. to Arc. Amer. June. 21.—Culm 1—2 feet high, erect, leafless, with 3 sheaths at base. Spike sometimes oblique, the lower glumes larger.

 Club Rusk.
- 2. S. capitatus Linn.: culm terete or somewhat compressed; spikt ovate, obtuse; seed oval, compressed, smooth.
 - Hab. Bogs and meadows. N. Y. to Car. July, Aug. 21.—
 Culms cespitose, erect, 8—18 inches high. Spike very obtuse, sometimes nearly globose. Glumes round. Bristles 6, as long as the glumes.
- 3. S. tuberculosus Mich.: culm columnar, striate; glumes very obtuse, loosely appressed; nut somewhat 3-angled; tubercle sagittate, larger than the nut.
 - Hab. Wet grounds. N. J. Schweinitz. S. to Car. July. 24.
 —Culm 12 inches high, sheathed at base with 1 or 2 scales.
 Spike ovate-lanceolate. Bristles 6, as long as the tubercle.
- 4. S. acicularis Linn.: culm setaceous, quadrangular; spike ovate, acute, 3-6-flowered; glumes somewhat obtuse; stamens 3; style bifid; seed obovate.
 - Hab. Margins of ponds. N. Y. to Car. June, July. 24.—Culm
 3-6 inches long, cespitose. Spikes about 4-flowered. Bristles
 4, rarely wanting.
- 5. S. intermedius Muhl.: culms cespitose, quadrangular, sulcate; spike ovate-oblong, acute; glumes rather acute; stamens 3; style 2-cleft; seed broad-obovate, compressed; tubercle distinct.
 - Hab. Marshes and swamps. N. S. Sept. 21.—Root creeping. Culms slender, 3—4 inches long. Spikes dark brown. Bristles 6, longer than the seed.—Closely allied to the preceding.
- 6. S. ccspitosus Linn.: culms cespitose, terete; spikes ovate, few-flowered; lower glumes bracteiform, as long as the spike; sheaths with rudiments of leaves.
 - b. callosus Big.: glumes thickened and cartilaginous at the tips.

 Hab. White Hills, N. H. Big. Arc. Amer. July. 24.—Culm

 8 inches high, slender. Spike 4—5-flowered, compressed.

 Glumes with whitish tips.
- 7. S. capillaccus Mich.: culm minute, capillary; spike oblong-ovate, acute, few-flowered; glumes linear, acute; seed compressed, obovate.

 —S. pusillus Vahl.? Pursh.
 - Hab. Salt marshes. N. Y. to Car. July. © ?—Culm 1—3 inches high, slightly furrowed. Nut crowned by a conic tubercle. Bristles 6.—Grows in large patches like moss.
 - 8. S. glaucescens Willd .: culm angular, compressed, glaucous; spike

lanceolate, compressed; glumes lanceolate, obtuse; sheaths truncate.

-S. glaucus Torr.?

HAB. Salt marshes. N. Y. July. 21.—Culm a foot high, slender. Glumes obtuse, brownish. Bristles 4, longer than the tubercle.—Dr. Torrey's name had been appropriated to a British species by Dr. Smith.

9. S. tenuis Willd.: culm very slender, quadrangular; spike elliptical, acute at each end; glumes ovate, obtuse; stamens 3; styles 3-cleft; seed rugose.

HAB. Swamps. N. Y. to Car. June, July. 21.—Culm 8—12 inches high. Spike rather obtuse, dark brown. Bristles 2—3,

sometimes none.

- 10. S. planifolius Muhl.: culm triquetrous; radical leaves flat, nearly equalling the culm; spike terminal, oblong, compressed, shorter than the cuspidate bracts at the base.
 - HAR. Swamps. N. S. June. 21.—Culms cespitose, 8 inches high, scabrous on the angles. Spike lanceolate. Bristles 3-4, longer than the nut.
- 11. S. subterminalis Torr.: culm floating, sulcate, inflated, leafy below; spike solitary, somewhat terminal, lanceolate; style 2-cleft; seed triquetrous.
 - Hab. Ponds, &c. Mass. Aug. 21.—Culm 3 feet long, spongy.

 Leaves very narrow. Spike shorter than the bract. Bristles 6, nearly as long as the triangular nut.
 - †† Spikes numerous, aggregated.
- 12. S. debilis Muhl.: culms cospitose, deeply striate; spikes about 3, lateral, ovate, sessile; glumes ovate, obtuse, mucronate.
 - HAB. Margins of ponds. N. Y. to Car. Aug., Sept. 21.—
 Culms 8-12 inches high, with a few subulate leaves at base.
 Spikes short, ovate, 2-3 inches from the top of the culm.
 Bristles 4-5.
- 13. S. americanus Pers.: culm nearly naked, triquetrous; sides concave; spikes lateral, (1—5) ovate, conglomerate, sessile; glumes round-ovate, mucronate; seed triquetrous, acuminate.—S. triqueter Mich.—S. pungens Vahl. Spreng.

Hab. Marshes and wet banks, N. Y. to Car. July. 21.— Culm 2—5 feet high, slender, 3-sided. Spikes a short distance

from the top, ferruginous. Bristles 6.

- 14. S. laeustris Linn.: culm terete, attenuated above, naked; panicle subterminal; spikes peduncled, ovate.—S. validus Pursh.
 - HAB. Ponds and marshes. N. Y. to Car. N. to Subare. Amer. June. 21.—Culm 4-8 feet high. Spikes in an unequal subdivided panicle or cyme. Bristles 4-6, hispid.
- 15. S. acutus Muhl.: culm terete, (not attenuated,) spotted; peduncles numerous, sublateral; spikes oblong; glumes pubescent, mucronate.
 - IIAB. Swamps. N. S. June, July. 21.—Culm 4 feet high, 36*

with brown spots. Spikes in a proliferous cyme or panicle, brown.-It is quite doubtful whether this is distinct from the preceding.

16. S. maritimus Linn.: culm triquetrous, leafy; corymb clustered; involucre about 3-leaved, very long; spikes oblong; glumes ovate, 3cleft, the middle segment subulate and reflexed; style 3-cleft.—S. robustus Pursh .- S. macrostachyos Muhl. Torr.

HAB. Salt marshes. N. Y. to Car. N. to Subarc. Amer. July, Aug. 21.—Culm 3-4 feet high. Leaves taller than the culm. Spikes 6-10, in a clustered panicle. Bristles 4.—Our plant does not appear to differ at all from the European.

17. S. brunneus Muhl.: culm leafy, obtusely triangular; cyme decompound; involucrum 3-4-leaved; spike round-ovate, clustered in about sixes; glumes ovate, obtuse.—S. exaltatus Pursh.

HAB. Margins of ponds and lakes. N. Y. to Car. Aug., Sept. 24. - Culm 2-3 feet high. Leaves long. Spikes brown. Seed

shorter than the bristles.

18. S. atrovirens Muhl: culm triangular, leafy; cyme terminal, compound, proliferous; involucrum 3-leaved; spikes conglomerate, ovate. acute; glumes ovate, mucronate, pubescent.

HAB. Wet meadows. N. S. June, July. 21.-Culm 2 feet high. Spikes crowded into small heads, brown, smaller than in

the preceding. Bristles 4, longer than the seed.

** Seed without bristles at the base.

19. S. capillaris Linn.: culm nearly naked, triquetrous, capillary; spikes ovate, 2-3 of them pedunculate, with an intermediate sessile one.—S. ciliatifolius Ell.

HAB. Wet grounds. N. Y. to Car. Aug. ©.?—Culm 8 inches high, slender. Leaves mostly radical, setaceous. Spikes somewhat umbelled. Seed naked at base.

20. S. autumnalis Linn.: culm compressed, ancipitous; umbel compound; involucre 2-leaved; spikes lanceolate, acute, somewhat 4sided .- S. mucronulatus Mich .- Fimbristylis autumnalis Vahl.

Hab. Low woods. N. Y. to Car. July—Oct. 21.—Culms 8—12 inches high, cespitose. Spikes sometimes clustered in threes. Style 3-cleft, not ciliate. (Torr.) Seed naked at base.

6. TRICHOPHORUM. Pers.

Spikelets nearly ovate, imbricated in all directions. Bristles of the seed usually 6, finally very much lengthened and ex-Triandria, Monogynia. serted.

1. T. cyperinum Pers.: culm obtusely 3-angled, leafy; panicle decompound, proliferous, somewhat nodding; spikes all pedunculate.-Eriophorum cyperinum Linn .- Scirpus eriophorum Mich. Torr.

AB. Wet grounds. Can. to Car. Aug. 21.—Culm 3—5 feet high, smooth. Involuere 4-leaved. Paniele terminal, much HAB. divided and proliferous. - This seems to be the connecting link between Scirpus and Eriophorum, but I think it nearest the latter.

2. T. lineatum Pers.: culm 3-angled, leafy; panicles terminal and lateral, decompound, at length nodding; involuere 1—2-leaved; spikes ovate; glumes lanceolate, somewhat carinate.—Scirpus lineatus Mich.—S. lineatus and pendulus Muhl.

Hab. Swamps. N. Y. to Geor. Aug. 24.—Culm 2-3 feet high, very leafy. Flowers in axillary unibels or panicles, at

length nodding.

7. ERIOPHORUM. Linn.

Glumes chaffy, imbricated in all directions. Seed surrounded by very long dense wool.

Triandria. Monogynia.

* Spike solitary.

1. E. alpinum Linn.: culm triquetrous, somewhat scabrous, naked; leaves very short, subulate; spike oblong; woolly hairs crisped, few.—E. hudsonianum Mich.—Trichophorum alpinum Pursh. Muhl.

HAB. Mountains. N. S. July. 21.—Culm 8-10 inches high; with 3-4 radical sheaths. Spike a little compressed. Hairs 6, white, very long. Cotton Grass.

2. E. raginatum Linn.: culm terete below, obtusely triangular above, smooth and rigid; sheaths inflated; spike oblong-ovate; glumes scarious; wool straight, dense.—E. cespitosum Pursh.

Hab. Swamps. Arc. Amer. to Virg. July. 21.—Culms a foot high, cespitose. Leaves longer than the culm. Spike long. Wool white, twice the length of the glumes.

** Spikes numerous.

- 3. E. polystachyon Linn.: leaves flat, triquetrous at the extremity; culm nearly terete; spikes on seabrous peduncles, nodding.—E. tenellum Nutt.
 - HAB. Swamps. N. S. July. 21.—Culm 1—2 feet high, smooth. Spikes on long filiform peduncles. Wool white, or reddish.
- 4. E. virginicum Linn.: culm nearly terete below, obtusely triangular above; leaves flat, very long; spikes clustered, erect, nearly sessile; involucre 2-3-leaved.

b. gracile Torr .: culm very slender; leaves almost filiform.

- Hab. Swamps. Can. to Geor. Var. b. Cedar swamps. N. J. July. 21 Culm 2-4 feet high. Leaves few, linear, long. Wool reddish.
- 5. E. angustifolium Roth.: culm somewhat triangular; leaves channelled and triquetrous; peduncles very smooth.
 - HAB. Swamps. N. S. N. to Are. Amer. July. 21.—Culm a foot high. Leaves very narrow. Spikes on short peduneles. Wool white.

8. SCHŒNUS. Linn.

Glumes fascicled into a spike, the lower ones empty. Style deciduous. Seed naked. Triandria. Monogynia.

S. mariscoides Muhl.: culm terete or a little sulcate, leafy; leaves channelled, semiterete; umbel terminal; fascicles on spikes, 3 on each peduncle; seed naked, rounded at the base.

HAB. Bogs. Mass. Big. N. Y. Gray. Penn. Muhl. July. 21.—Culm 2 feet high, smooth or with rough dots. Spikes lanceolate, brown. Style 2—3-cleft. Bog Rush.

9. RHYNCHOSPORA, Vahl.

Glumes fascicled into a spike, the lower ones empty. Seed 1, crowned with the persistent style; its base surrounded with bristles.

Triandria, Monogynia.

- 1. R. alba Vahl.: spikes in corymbose fascicles; culm triangular above; leaves setaceous; seed somewhat lenticular; bristles about 10.
 —Schanus albus Linn.
 - HAB. Swamps and bogs. N. Y. to Car. July—Sept. 21.— Culm 12—18 inches high. Fascieles axillary and terminal, peduncled. Glumes nearly white, at length brownish.
- 2. R. fusca Valil.: culm triquetrous; leaves linear, carinate; fascicles of spikes alternate, pedunculate; spikes ovate; glumes ovate, brown; seed ovate, with an acute black tubercle.—Schanus fuscus Linn.
 - Hab. N. Y. Muhl. 24.—Culm 2 feet high. Leaves smooth.

 Glumes mucronate. Seed brown, rugose, as long as the hispid bristles.
- 3. R. glomerata Vahl.: spikes in corymbose fascicles, very distant, by pairs; culm obtusely triangular; leaves flat; seed obovate-cuneiform, very smooth, as long as the tubercle.—Schanus glomeratus Linn.
 - HAB. Swamps and bogs. N. J. to Car. July, Aug. 21.—Culm 12—18 inches high, smooth and leafy. Spikes lanceolate. Glumcs brown.
- 4. R. capillacea Torr.: spikes 3—5, nearly terminal; culm triquetrous, somewhat leafy; leaves setaceous; seed stipitate, a little rugose.—Schanus sciaccus Muhl.
 - Hab. Sandy swamps. N. J. and Penn. July. 21.—Culm 8 inches high, slender. Spikes with a setaceous bract at base. Glumes brown. Bristles 6, longer than the seed.
- 5. R. sparsa Vahl.: culm triquetrous, leafy; corymbs axillary and terminal, compound, loose; peduncles capillary; seed obovate, rugose, much longer than the tubercle.—Schanus sparsus Mich. Muhl.

HAB. Wet grounds. Penn. to Car. July. 21.—Culm 2 feet high. Flowers in spreading panicles. Glumes brown. Bristles twice as long as the seed.

6. R. cymosa Torr.: culm triquetrous, leafy; cymes terminal and axillary; the terminal one much larger; sced round-ovate, compressed, transversely rugosc; tubercle conical.—Schanus cymosus Willd. Mich.

IIAB. Swamps. Penn. to Car. July. 24.—Culm 12—18 inches high. Glumcs broad ovate, lower one mucronate. Bristles shorter than the seed.

7. R. lara Vahl.: culm triquetrous; corymbs leafy, decompound, loose; spikes subulate; seed oboyate, pointed with the long persistent style.—R. longirostris Ell.—Schanus longirostris Mich.

Hab. Swamps. Del. to Car. July. 21.—Culm 3-6 feet high. Leaves 1-2 feet long. Bristles 6, shorter than the seed.

10. MARISCUS. Vahl.

Flowers distinct, in a somewhat imbricate spike. Glume 2-valved, unequal, 3-flowered. Palea 1. Style 3-cleft. Seed triquetrous, naked. Triandria. Monogynia.

. 1. M. retrofractus Vahl.: umbel simple; rays long; spikes obovate, retrosely imbricate; spikelets subulate, at length bent backwards; involucre 3-leaved.—Scirpus retrofractus Linu.

HAB. Wet grounds. N. Y. to Car. July, Aug. 21.—Culm 2 feet high, naked, triangular. Leaves linear, long. Umbel with

6-8 unequal rays, longer than the involucre.

2. M. ovularis Vahl.: umbel simple; rays short; spikes globose; flowers spreading.—M. cchinatus Ell.—Killingia ovalaris Mich.—Scirpus cchinatus Linn.

b. tenellus Torr.: culm acutely triangular, slender; involucre 3-5-leaved, 3 of the leaves many times longer than the umbel.

Hab. Bogs and low grounds. N. Y. to Car. July, Aug. 24.

-Root bulbous. Culm 6-18 inches high. Spikes forming a globose head. Style 3-cleft.

11. FUIRENA. Linn.

Glumes awned, imbricated on all sides into a spike. Palea 3, (or perianth 3-valved,) petaloid, cordate, awned, unguiculate.

Triandria. Monogynia.

1. F. squarrosa Mich.: spikes clustered, (5-6,) ovate; culm smooth; leaves ciliate; sheaths hairy; valves of the perianth cordate-ovate.

HAB. Bogs. N. J. to Car. Aug., Sept. 21.—Culm 1—2 feet high, angular, slender at the top. Spikes clustered into 2 heads, the lateral one upon a long peduncle.

2. F. torreyana Bcck: spikes 1—3, terminal; culm pubescent above; leaves smooth; throat of the sheaths hairy.—F. squarrosa var. pumila Torr.—F. pumila Spreng.

HAB. Wet sandy places. N. Y. Torr. Aug. 21.—Culm 3-6 inches high, angular, smooth. Spikes generally 3, often soli-

tary.

DIV. III. SCLEREÆ.

12. SCLERIA. Linn.

Monoecious. Sterile Fl. Glumes 2 or 6, many-flowered. Paleæ unarmed. Fertile Fl. Glumes 2 or 6, 1-flowered. Paleæ none. Stigmas 1—3. Nut coloured, subglobose. Monoecia. Triandria.

1. S. triglomerata Mich.: culm erect, acutely triquetrous, scabrous; leaves broad-linear, subscabrous and a little hairy; spikes lateral and terminal, fasciculate; glumes ciliate, mucronate; nuts smooth and polished.

HAB. Swamps. Penn. to Car. June, July. 21.—Culm 3—4 feet high. Nut large, white and hard. Whip Grass.

2. S. pauciflora Muhl.: stem triquetrous and with the narrow leaves smooth; spikes lateral and terminal, few-flowered; the lateral ones pendulous, terminal, fasciculate; glumes smooth; seed roughened.

HAB. Low meadows. Penn. to Car. Aug. 2f.—Culm 2 feet high, slender. Lateral spikes 2, on long pendulous peduncles.

3. S. verticillata Muhl.: stem simple, triquetrous, and with the leaves smooth; spike glomerate, naked, the clusters alternate, distant; glumes smooth; seed globose, mucronate, transversely corrugate.

HAB. Wet grounds. Penn. to Car. Aug. 21.—Culm a foot high, very slender, smooth. Spikes small. Nut small, tuberculate.

DIV. IV. CARICINÆ.

13. CAREX. Linn.

Monoecious, (rarely dioecious.) Flowers collected into an imbricated ament. Glume 1-flowered. Corol (or nectary or perianth) ventricose, 1-valved, persistent, enclosing the coriaceous nut or caryopsis. Monoecia. Triandria.

Obs. Two excellent Monographs of the North American species of this genus, have been published. The one by Prof. Dewey, is contained in Silliman's Journal, from the 7th to the 14th volumes, inclusive; —the other by Mr. Schweinitz and Dr. Torrey, in the first volume of the Annals of the New-York Lyceum. I shall adopt the latter, with a few additions.

A. Inflorescence dioecious.

1. C. sterilis Willd.: spikes dioecious; sterile 3-5; fertile about 6, (sometimes androgynous;) fruit ovate, compressed, triquetrous; margin ciliate-serrate; apex recurved and bicuspidate.

HAB. Marshes. N. Y. Penn. Car. May. 21.—Culm 8—12 inches high. Spikes approximate, oblong.

- B. Inflorescence monoecious.
- † All the spikes androgynous.
 - * Spike solitary.
 - a. Summit staminiferous.
- 2. C. frascri Sims: spike simple, ovate; fruit ovate-subglobose, entire at the point, longer than the oblong glume; leaves lanceolate, undulate, crenulate; scape sheathed at the base.— C. lagopus Muhl.

HAB. Mountains. Penn. N. Car. April. 21.—Leaves broad, radical.

- 3. C. willdenovii Schk.: spike simple, ovate; sterile and fertile flowers about 6; fruit ovate, subglobose at the base, rostrate; glumes ovate, acuminate; the inferior ones very long and foliaccous, much exceeding the culm.
 - Hab. Rocky woods. Penn. to N. Car. May, June. 21.—Culm 8—12 inches high. Lower glumes foliaceous and much longer than the spike.
- 4. C. polytrichoides Muhl.: spike simple; fruit oblong-lanceolate, compressed, triquetrous, obtuse, emarginate; glumes oblong-obtuse, mucronate.
 - HAB. Dry hills and bogs. Can. to Penn.; common. May. 21.
 Culm a foot high, very slender. Leaves subradical, very narrow.
- 5. C. pauciflora Light.: spike about 4-flowered; sterile flower subsolitary, terminal; fruit lanceolate, terete, reflexed; fertile glumes caducous.
 - HAB. Sphagnous swamps. May, June. 21.—Culm 8 inches high. Fruit large, pale yellow, caducous.
 - b. Summit pistilliferous.
- 6. C. squarrosa Linn.: spike mostly simple, (sometimes spikes 2-3,) very thick, oblong-cylindrical; fruit imbricate, at length horizontal, smooth, subsquarrose, bidentate at the point, longer than the lanceolate glume.—C. typhina Mich.
 - HAB. Bogs. Can. to Geor. W. to Miss. May, June. 21.— Culm 2 feet high. Spike nearly an inch long and half an inch thick.
 - ** Spikes several, aggregated into a head.
- 7. C. cephalophora Muhl.: spikes collected into an elliptical head; fruit ovate, scabrous on the margin above, about equal to the ovate subaristate glume.
 - HAB. Oak woods. Can. to Car.; common. May. 2f.—Culm
 1—2 feet high, wiry, leafy at base. Spikes forming a trifid head.
 - *** Spikes distinct, (not aggregated into a head.)
 - a. Summit staminiferous.
 - 1. With 2 stigmas.
- 8. C. bromoides Schle.: spikes 4-6, alternate, oblong, erect, uppermost one sterile above, the rest pistilliferous or androgynous (sterile

above and below;) fruit erect, lanceolate acuminate, scabrous, nerved,

bifid, longer than the ovate-lanceolate glume.

HAB. Bogs. N. S.; common. May. 21.-Culm 12-18 inches high, slender and scabrous. Spikes subdistichous, half an inch long.

9. C. retroflexa Muhl.: spikes about 4, subapproximate, ovate, the lowest one with a short bract; fruit ovate-lanceolate, bidentate, scabrous on the margin, spreading and reflexed, as long as the ovate acute

HAB. Meadows, &c. N. S. May. 24-Culm 8-12 inches high, nearly 6-sided. Spikes 3-5, rarely 9; the lower one dis-

10. C. rosea Sehk.: spikes 4-6, remote, about 9-flowered, the lowest one with a setaceous bract overtopping the culm; fruit ovate, acuminate, diverging and radiate, scabrous on the distinct margin, twice as long as the ovate obtuse glume.

Moist woods. N. S.; common. May. 21.-Culm a foot Spikes 3-6, yellowish-green; lower ones distant.

11. C. disperma Dew.: spikes about 3, rather remote, mostly 2flowered, somewhat erect, the lowest one bracteate; fruit ovate, rather obtuse, nerved, plano-convex, smooth, with a scabrous margin, entire at the point, twice as long as the ovate, obtuse submucronate glume.

HAB. Mountain woods. N. Y. Mass. May, June. 21.—Culm 6-12 inches high. Fruit small. Var. tetrasperma has the fer-

tile spikes 3—4 flowered.

12. C. muhlenbergii Sehk.: spikes about 5, ovate, crowded at the summit of the culm, bracteate at the base; fruit broad-ovate, compressed, nerved, bifid, somewhat diverging, scabrous on the margin, rather shorter than the ovate mucronate glume.

HAB. Rocky woods. N. Y. S. Car. May. 21.-Culm 1-2 feet high, thick. Plant dark green.

13. C. stipata Muhl.: spike compound, oblong; spikelets numerous, (10-15,) oblong, aggregated, bracteate; bracts a little longer than the spikelets; fruit lanceolate, subterete and smooth below, spreading, bidentate at the point, which is scabrous, twice as long as the glume.

HAB. Wet meadows. Throughout the U. S. April, May. 21. -Culm 1-3 feet high, thick and succulent, smooth. Spike

consisting of many crowded spikelets.

14. C. sparganioides Muhl.: spikelets about 8, many-flowered; upper ones approximate, lower ones subdistant, bracteate; fruit ovate, compressed, acuminate, bifid, diverging, scabrous on the margin, twice as long as the ovate mucronate glume.

HAB. Wet meadows. Throughout the U.S.; rather rare. May.

24.-Culm 2 feet high. Lower spikes remote.

15. C. multiflora Muhl.: spike oblong, decompound, bracteate, interrupted; spikelets glomerate, ovate-oblong, obtuse; fruit ovate acuminate, compressed, crowded, bifid, 3-nerved, serrulate on the margin, at length diverging, rather shorter than the ovate cuspidate glume.

HAB. Wet meadows. N. Y. to Car.; common. May. 24.— Culm 2 feet high, obtusely triangular. Spike subpaniculate.

16. C. sctacca Dcw.: spike oblong, decompound, bracteate; spikelets glomerate, ovate, obtuse; fruit ovate, acuminate, compressed, bifid, subdiverging, as long as the ovate-lanceolate awned glume.

Hab. Wet meadows. Mass. Dev. June, July. 21.—Culm 18—30 inches high, acutely triangular, sulcate.—Resembles the preceding, but its fruit is less ovate, longer and more compressed.

pressed.

17. C. paniculata Linn.: spike decompound, paniculate, interrupted, the branches alternate and somewhat remote; fruit ovate, acuminate, spreading, margined above, bifid.

HAB. Wet meadows. Mass. N. Y. N. J. May. 21.—Culm 18 inches high. Spikes not becoming black.

18. C. teretiuscula Good.: spike decompound or paniculate, dense,

18. C. terctiuscula Good.: spike decompound or paniculate, dense, subacute, (often dioccious, at length brown); spikelets with short bracts at the base; fruit ovate, acuminate, somewhat gibbous at the base, bidentate, ciliate-serrulate on the margin.

HAB. Marshes and bogs. N. Y. and N. Eng. May.—Culm 18

inches high. Spike narrow. Fruit and glume brown.

2. With 3 stigmas.

19. C. pedunculata Muhl.: spikes about 4, on long peduncles, very remote; fruit obovate, triquetrous, obtuse, smooth, entire at the orifice; glumes ovate, mucronate, (purple and green.)

IIAB. Rocky hills. Can. to Penn. May. 24.—Culm filiform, 6 inches high. Peduncles mostly radical. Glumes purplish and

green.

20. C. ovata Rudge.: spikes about 5, pedunculate, ovate, pendulous; fruit obovate, acute at each end, as long as the ovate acute glume.

Hab. Canada. 21.—Culm acute, triangular. Spikes densely imbricate. Glumes brown, as long as the fruit.

b. Summit pistilliferous.

1. With 2 stigmas.

21. C. deweyana Schw. & Torr.: spikes about 3, sessile, loose, two of them approximate, the third distant, with long bracts at the base, (except the highest); fruit oblong-lanceolate, subcompressed, rostrate, bifid at the point; beak serrulate; culm flaccid.

HAB. Woods. N. Y. and N. Eng. June. 2f.—Culm 1—4 feet high, weak and slender, subprocumbent.—Plant yellowishgreen.

giccii

22. C. loliacca Linn.: spikes about 4, rather distant, few-flowered; fruit elliptical, obtuse, nerved, compressed, erect.

HAB. Swamps. N. J. ? N. to Arc. Amer.—Culm 2 feet high, slender. Spikes 3—5-flowered.

23. C. trisperma Dew.: spikes 3, remote, alternate, sessile, ovate, uppermost one without a bract; fruit oblong, acute (or short-rostrate) entire at the point, many-nerved, subscabrous above, somewhat diverging, longer than the oblong acute hyaline glume.

HAB. Mountain swamps. N. Eng. June. 21.—Culm 18 inches high, filiform, prostrate. Whole plant pale green.—Allied to the preceding, but differs in the glume and fruit.

24. C. arida Schw. & Torr.: spikes 8, (large) subapproximate, dry; fruit elliptical, compressed, winged, terete in the middle, acuminate at each end, divergingly bifid; culm leafy.

HAB. Meadows. Ohio and W. June. 21.-Culm 2-3 feet high. Leaves very long, dark green. Spikelets very large.

gray.

25. C. lagopodioides Schk.: spikes numerous, (10-16,) elliptic, crowded; bract beneath the lowest overtopping the culm; fruit laneeolate, acuminate, erect, bicuspidate, with a narrow serrulate margin, twice as long as the ovate-lanceolate glume.

HAB. Wet meadows. N. Y. to Car. May. 21.—Culm 1—2 or more feet high, furrowed. Spikes large, subcylindric when

young,

26. C. scoparia Schk.: spikelets mostly 5, (sometimes 6 or 7,) ovate, sessile, approximate, aggregate, lowest one bracteate; fruit ovate-lanceolate, margined, nerved, smooth, bicuspidate, longer than the lanceolate acuminate glume.

HAB. Swamps. N. Y. Mass. S. to Car. May. 21.—Culm 1-2 feet high. Leaves long and narrow. Fruit tawny when

mature, not winged, 9-nerved.

27. C. straminea Willd.: spikes about 5, (4-7,) roundish, approximate, with short bracts at the base; fruit roundish-ovate, rostrate. compressed, broadly ovate, bidentate, serrulate, longer than the lanceolate glume.

HAB. Wet meadows. N. Y. and N. Eng. May. 21.-Culm 8-12 inches high, leafy. Spikes yellowish when mature. Fruit

acuminate.

28. C. fanea Muhl.: spikes numerous, (8-10,) inferior ones distinct, upper ones aggregated and confluent; fruit ovate, acuminated, winged, bidentate, somewhat longer than the ovate glume.

HAB. Marshes. Penn. to Car. June. 21 .- Culm 2 feet high, obtusely triangular, furrowed. Spikes subglobose. Glumes

ribbed, ciliate.

29. C. cristata Schw. & Torr. : spikes numerous, (8-15,) aggregated into a kind of head; fruit ovate-lanceolate, winged, diverging, serrate, longer than the ovate-lanceolate glume.

HAB. Wet woods. N. Y. Mass. Penn.; common. June. 21. -Culm 2 or more feet high. Spikes crowded into an ovate

head.

30. C. festucacea Schk.: spikes obovate, (5-8,) subapproximate, bracteate; fruit roundish-ovate, rostrate, bidentate, winged, serrulate on the margin, longer than the ovate-lanceolate glume.

HAB. Meadows and woods. Throughout the U.S. May. 24.

—Culm 30 inches high, sometimes decumbent. Fruit silvery

white or pale green, not becoming tawny.

31. C. stellulata Good.: spikes 3-4, rather remote, upper one attenuate at the base, the rest ovate; fruit ovate, plano-convex, spreading, and at length reflexed, short-acuminate, scabrous on the margin.

HAB. Wet grounds. N. Y. to Car. May. 21.—Culm 8-18 inches high, slender. Fruit broad ovate, almost cordate when

ripe.

- 32. C. scirpoides Schk.: spikes 4, ovate, obtuse, approximate, uppermost one clavate; fruit ovate, bidentate, plano-convex, erect, and a little spreading, but not reflexed, subcordate, serrulate, longer than the ovate obtuse glume.
 - HAB. Wet meadows. N. Y. to Car. May. 24.—Culm 6—12 inches high, stiffly erect. Fruit erect or spreading horizontally.
- 33. C. curta Good.: spikes about 6, subremote, somewhat cylindric-ovate, tumid, sessile; fruit short-ovate, plano-convex, rather acute, erect, entire at the point.

HAB. Wet meadows. Can. and N. Y. May. 24.—Culm 2 feet high, nodding at the top. Glumes whitish, with a green keel.

34. C. tenera Dew.: spikes about 5, obovate, rather remote, sessile attenuate at the base, the lowest bracteate; fruit ovate, compressed, rostrate, serrulate, longer than the oblong-lanceolate glume.

HAR. Moist meadows. Mass. N. Y. May. 21.—Culm 15—30 inches high. Spikes nodding, brownish.—Resembles C. scoparia, but differs in the form of the fruit. Dr. Torrey queries whether it is not C. sterilis.

35. C. remota Linn.: spikes alternate, remote; bracts leafy, very long; fruit ovate acuminate, bifid, somewhat compressed.

HAB. Woods. Penn. ? Torr. N. to Arc. Amer.

2. With 3 stigmas.

36. C. atrata Linn.: androgynous spikes 3, pedunculate, crowded, subpendulous in fruit, (black;) fruit roundish-ovate, with a short beak, bidentate.

HAB. White Hills. N. H. Nutt. Rocky Mountains. James. June. 21.—Culm 6 inches high. Spikes large, black.

 Summits of the highest and lowest spikelets staminiferous—the middle spikes entirely staminiferous.

1. With 2 stigmas.

37. C. siccata Dew.: terminal spikes obtuse; lower ones mostly in fours, ovate, somewhat acute; fruit ovate-lanceolate, acuminate, compressed, scabrous on the margin, bifid, nerved, nearly equal to the ovate-lanceolate scale.

- HAB. Sandy plains. Mass. June. 2f.—Culm 12—18 inches high, small, stiff and scabrous. Spikes 3—7, ovate, approximate. Plant of a light green colour, and of a dried appearance.
- tt Terminal spikes androgynous; the rest pistilliferous; stigmas 3.
- 38. C. rirescens Muhl.: spikes 3, oblong, erect; upper one pedunculate, sterile below, the rest fertile, subsessile and bracteate; fruit ovate, obtusc, costate, pubescent.

b. costata S. & T.: spikes larger; fruit strongly costate; exterior

slicaths purple.

- HAB. Dry woods. Can. to Car. May. 21.—Culm 18—24 inches high. Leaves and sheaths pubescent. Spikes approximate. Plant dull green. Var. b. is larger in all its parts.
- 39. C. hirsuta Willd.: spikes 3, crcct, approximate, densely fruited, upper one ovate-oblong, on a short peduncle; the rest ovate, subsessile, bracteate; fruit roundish-ovate, nerved, obtuse, smooth, orifice entire, longer than the ovate acuminate glumes; leaves and sheaths pubescent.
 - Hab. Rocky woods and meadows. Can. to Geor. W. to Mich. May. 21.—Culm 12—18 inches high. Fruit pubescent when young .- Resembles C. virescens, but differs in its shorter and thicker spikes and in the fruit being smooth when mature.
- 40. C. buxbaumii Wahl.: spikes about 4, obovate, subremote, upper one androgynous and pedunculate, the rest sessile, with very long bracts; fruit ovate, obtuse, rather compressed, orifice entire, shorter than the ovate acuminate (brown) glume.

HAB. Swamps. N. S. W. to Mich. June. 24.—Culm 2 feet high. Glumes dark brown. Fruit smooth, pale green.

41. C. digitalis Muhl.: spikes mostly 4, distant, slender, pedunculate, loosely-flowered, nodding; uppermost androgynous, fertile above; the rest all fertile; fruit oblong, subtriquetrous, obtuse, smooth, longer than the oblong mucronate glume.—C. gracillima Dew.

HAB. Wet meadows. N. Y. N. Eng. and Penn. W. to Mich.

May. 21 .- Culm 18 inches high, slender, but erect. Spikes

linear and filiform. Plant smooth and pale green.

- 42. C. formosa Dew.: spikes 4, oblong, thick, distant, on exsert peduncles, nodding, uppermost one sterile at the base; fruit oblong, triquetrous, somewhat inflated, rather acute at each end; orifice nearly entire or 2-lobed, obscurely nerved, twice as long as the ovate acute glume.
 - HAB. Wet meadows. Mass. Dew. May. 24.—Culm 12—18 inches high. Leaves sometimes pubescent. Plant yellowishgreen .- Allied to the preceding, but differs in its acute fruit, shorter and ovate spikes, &c.
- 43. C. torreyana Dew.: spikes 4, filiform, pedunculate, somewhat nodding, uppermost one sterile at the base; fruit oblong, triquetrous,

acute at each end, slightly 2-lobed, shorter than the oblong awned glume; leaves and sheaths pubescent.

IIAB. Meadows. N. Y.; rare. June. 24.—Culm 18 inehes high. Spikes slender. Rachis flexuous. Glumes hyaline.

††† Staminiferous and pistilliferous spikes distinct.

* Staminiferous spike solitary.

1. With 2 stigmas.

44. C. novæ angliæ Schw. & Torr.: sterile spike on a short peduncle; fertile 2—3, sessile, ovate, few-flowered, rather remote; fruit oval-subtriquetrous, rostrate, minutely pubeseent, longer than the ovate-mucronate glume; culm slender, subdecumbent.

HAB. Saddle Mountain. Mass. Junc. 24.—Culm 6—8 inches high, with very small and narrow leaves. Spikes usually 4-flow-

ered, lower ones distant.

45. C. aurea Nutt.: fertile spikes mostly 3, oblong, loose flowered, subpendulous, rather approximate, lower ones pedunculate; fruit obovate or pyriform, obtuse, nerved, entire at the orifice, longer than the ovate acute glume.

HAB. Wet rocks. Can., N. Y. and Mass. W. to Mich. May, Junc. 21.—Culm 4—10 inches high, subprocumbent, slender.

I'mit orange coloured when mature.

2. With 3 stigmas.

§ Pistilliferous spikes sessile, or with the peduncles inclosed.

46. C. varia Muhl.: fertile spikes 2—3, approximate, few-flowered, ovate, subsessile; sterile spike sessile, (or on a short peduncle;) fruit subglobose, acuminate, bifid, obtusely triangular, hispidly pubescent, as long as the ovate acuminate glume.

HAE. Dry woods. Hudson's Bay to Geor. April. 21.—Culm 8—12 inches high, erect, filiform. Fruit ventricose, nearly

globose.

47. C. marginata Muhl.: sterile spike pedunculate; fertile spikes mostly 2, approximate, subglobose, subsessile; fruit globose, woolly, bidentate, longer than the ovate-oblong glume.

HAB. Dry woods. Can. to Car.; common. April. 4.—Culm 8—12 inches high, slender. Sterile spike somewhat 3-sided.

Glumes brown, with a white margin.

48. C. vestita Willd.: sterile spike mostly solitary, (rarely geminate, with the upper one elongate,) pedunculate, cylindrical-oblong; fertile 2, ovate-oblong, sessile, subapproximate, sometimes sterile at the summit; fruit ovate, subtriquetrous, nerved, with a short rostrum, pubescent, rather longer than the ovate mucronate glume.

HAB. Wet grounds. Mass. to Geor.; rather rare. May, June. 21.—Culms in tufts 2 feet high. Glumes brown, with a white

margin. Fruit with a short and bifid beak.

49. C. pubeseens Muhl.: sterile spike subsessile; fertile 3, oblong, erect, rather loosely-flowered, the lowest on a short pedunele; fruit

ovate triquetrous, rostrate, pubescent, orifice nearly entire, as long as the ovate nucronate glume; leaves and culm pubescent.

HAB. Woods. Can. to Penn. May. 21.—Culm 12—18 inches high, erect or subdecumbent. Leaves very pubescent.

50. C. flava Linn.: sterile spike on a short peduncle; fertile mostly 3, ovate, subapproximate, (the lowest rather remote,) on short included peduncles; fruit ovate, densely imbricate, bidentate, with a curved and reflexed rostrum, shorter than the ovate-lanceolate glume.

Hab. Mcadows. Can. and N. Y. 21.—Culm 12—14 inches high, erect. Fertile spikes 2—4. Whole plant greenishyellow.—Found in the western part of New-York, by Dr. Gray.

51. C. aderi Linn.: sterile spike on a short peduncle; fertile about 3, ovate, approximate, subpedunculate, densely flowered; fruit ovate-globose, horizontal, with a straight rostrum.

Hab. Rocky banks. Hudson's Bay, Can., N. Y. and N. J. June. 24.—Culm 8—12 inches high.—Resembles C. flava, but differs in having the spikes more densely flowered and the fruit

smaller.

52. C. tentaculata Muhl.: fertile spikes 2—3, (rarcly 4,) sessile, ovate or ovate-cylindrical, approximate, horizontal; bracts very long; fruit ovate, ventricose, nerved, with a very long rostrum, orifice bidentate, longer than the lanceolate glume.

HAE. Wet meadows. Can. to Geor. May, June. 21.—Cul no. 12—18 inches high. Spikes large and thick, varying in length.

Plant yellowish-green.

53. C. nigra All.: sterile spike pedunculate; fertile 2—3, (rarely 4,) rather remote, oblong (black) sessile, erect; fruit obovate, compressed-triquetrous, subacute, orifice entire, as long as the ovate glume.

Hab. Labrador. White Hills, N. H. July. 21.—Culm 8-12 inches high. Fruit smooth and nerveless. Stigmas 2-3.

54. C. lupulina Muhl.: sterile spike on a short peduncle, (rarely geminate;) fertile 3, subsessile, ovate-oblong, erect, approximate; bracts very long and leafy; fruit ovate, inflexed, nerved, long-rostrate, bicuspidate, much longer than the ovate glume.

b. polystachia T. & S.: fertile spikes 5, oblong-cylindric, lowest

one remote, on a long peduncle.

c. pedunculata Gray: fertile spikes all pedunculate; the lower

long-pedunculate, distant, the 3 upper subumbellate.

Hab. Swamps. Hudson's Bay to Geor. June. 21.—Culm
2-3 feet high, very thick, smooth and leafy. Spikes very thick.
Var. c. was found by Dr. Gray on the shores of Lake Erie.
It flowers in July.

55. C. folliculata Linn.: sterile spike pedunculate; fertile 2, (often solitary,) roundish, approximate, few-flowered, upper one sessile, lower one short peduncled; bracts leafy; fruit ovate, acuminate-rostrate, ovate, reflexed and diverging, bicuspidate.

- HAB. Swamps. Can. to Geor. Junc. 21.—Culm 18 inches high. Spikes 6—10-flowered. Plant dark green.
- 56. C. zanthophysa Wahl.: fertile spikes 3-4, ovate, very remote, pedunculate, few-flowered; fruit oblong-conical, somewhat inflated, striate, horizontal when mature, acute, bifid, longer than the ovate acuminate-gluine.

HAB. Swamps. N. Y. to Car. June. Culm 2-4 feet high, slender, leafy. Fruit 1-2 inch long, tapering into a long acute

point.—Plant at length yellow-green.

57. C. subulata Mich.: sterile spikes short-pedunculate; fertile mostly 4, sessile, or with included peduncles, very remote, few-flowered, sterile at the apex; fruit subulate, reflexed, much longer than the lanceolate glume; culm very slender.

HAB. Cedar swamps. N. J. July. Culm 2 feet or more high.Spikes 3-5-flowered. Fruit with a long slender beak.

58. C. alpastris All.: fertile spikes 3, 5-flowered, the 2 uppermost approximate and sessile, the lowest radical, on a long peduncle; fruit obovate-oblong, triquetrous, scarcely rostrate, subpubescent, orifice oblique, as long as the oblong-glume.

HAB. Woody hills. Mass. Culm 6 inches high.

59. C. collecta Dev.: sterile spike solitary, erect, loosely imbricate, slender, subpeduncled; fertile spikes mostly in threes, ovate, few-flowered, bracted; lower one on a short peduncle; fruit ovate, beaked, sub-bidentate, somewhat pubescent, longer than the ovate acute scale.

HAB. Bogs. Mass. May. Culm 6—10 inches high, procumbent when mature. Plant light green.—Allied to C. novæ angliæ, but differs in number of stigmas and in other characters. From C. varia it differs in its staminate spike, its manner of growth, scale, and in its fruit being more ovate, &c.

- §§ Pistilliferous spikes on exsert peduncles, partly sheathed at the base.
- 60. C. alba Hænke.: sterile spike pedunculate; fertile 2-3, pedunculate, about 5-flowered; fruit obovate, with a short rostrum, obliquely truncate; sheath at the base of the culm hyaline, leafless.

Hab. Limestone hills. N. H. and Ver. June. Culm 4-10 inches high, filiform, sulcate. Bracts ovate, white. Fruit black when mature.

61. C. plantaginea Lam.: fertile spikes mostly 4, on peduncles scarcely exserted, loosely flowered; fruit oblong-cuneiform, triquetrous, recurved at the apex; culm sheathed at the apex; sheaths of the culm all leafless, (coloured;) leaves broad.

HAB. Mountain woods. N. Y. Mass, and Penn. April, May. Culm 8-12 inches high, nearly leafless, with purple sheaths.

Glumes dark brown.

62. C. anceps Muhl.: fertile spikes mostly 3, remote, subcylindric, loosely flowered, lower ones pedunculate; fruit ovate, triangular,

acute, striate, narrowed at the base, orifice obscurely bidentate, about as long as the ovate cuspidate glume.—C. plantaginca Muhl. Ell.

HAB. Woods. Can. to Car. April, May. Culm 12—14 inches high. Leaves sometimes very broad; hence this plant has been confounded with the preceding.

63. C. oligocarpa Schk.: fertile spikes 3, pedunculate, few-flowered: lower peduncles elongate; fruit short-ovate, acutely triangular, with a short rostrum, orifice entire, longer than the ovate glume.

Hab. Rocky woods. Hudson's Bay to Penn. May. Culms in tufts, 6 inches high, slender, with the angles very prominent. Leaves subglaucous. Spikes 5—8-flowered.

64. C. scabrata Schw. & Torr.: fertile spikes 5, subremote, cylindrical, mostly erect, lower ones long-pedunculate; fruit ovate, with an acuminate rostrum, subventricose, scabrous, orifice oblique and somewhat bifid, longer than the ovate-lanceolate ciliate glume.

HAB. Swamps. N. H. Mass. N. Y. May. Culm 18 inches high. Leaves long and very rough. Plant dark green.

65. C. conoidea Schk.: fertile spikes 2—3, oblong, remote, rather loose, uppermost subsessile, lower ones on long peduncles; fruit oblong-conical, obtuse, recurved at the apex, as long as the awned glume.—C. blanda Dew.

Hab. Woods, &c. Can. to Car. May. Culm 6—12 inches high; angles scabrous. Leaves thin and flat. Spikes pale green.
—A variable species.

66. C. tetanica Schk.: sterile spike long-pedunculate; fertile 2—3, remote, rather densely flowered, upper one subsessile, lowest on a long peduncle: fruit ovate-oblong, acute at each end, nerved, subgibbous at the summit, oblique, orifice entire, longer than the ovate mucronate glume.—C. granularioides Dew.

Hab. Wet meadows. Can. to Car. May. Culm a foot high, Spikes very remote.

67. C. laxiflora Lam.: sterile spike subsessile; fertile mostly 3, rather loose, remote, pedunculate, erect; fruit ovate oblong, ventricose, obtuse, somewhat shining, longer than the ovate cuspidate glume.

HAB. Woods, &c. Can. to Geor. May. Culm 12-18 inches high. Fruit shining, inflated when mature.

68. C. granularis Muhl.: sterile spike sessile or short-pedunculate; fertile mostly 3, remote, cylindrical, dense; uppermost subsessile, lowest on a long peduncle; fruit globose-ovate, nerved, orifice entire: rostrum very short and recurved.

Hab. Wet grounds. Can to Penn. May. Culm a foot high.

Leaves subglaucous. Fruit ventricose, strongly nerved.

69. C. sylvatica Huds.: fertile spikes mostly 4, remote, filiform. dense, peduncles nodding; fruit ovate, rostrate, bifid, twice as long as the ovate mucronate glume.

- IIAB. Woods. Can. and N. S. May. Culm 12-18 inches high. Spike 1 1-2 inches long. Plant pale green.
- 70. C. flexuosa Muhl.: fertile spikes 4, remote, filiform, on nodding peduncles; fruit distant, alternate, oblong, acute at each end, rostrate, bifid, twice as long as the ovate-mueronate glume.

Har. Wet meadows. Can. to Geor. June. Culm 18-24 inches high, sometimes procumbent. Leaves narrow. Spikes 2 inches long. Ruchis at length flexuous.

- 71. C. washingtoniana Dew.: sterile spike solitary, erect; fertile spikes oblong, cylindric, subsessile, subremote, erect; flowers somewhat scattered; fruit oval, acute at each end, compressed, shortly beaked, with a smooth and entire orifice, about equalling the ovate-oblong, acutish scale.
 - IIAB. Damp grounds. White Mountains, N. H. June. Culm a foot high, seabrous above. Fertile spikes 2—4 inches long, loose flowered. Plant light green, spikes black or dark brown.
- 72. C. halseyana Dew.: sterile spikes mostly 2, oblong, erect, sessile, lower ones shorter; fertile spikes remote from the sterile, solitary, oblong, cylindric, on a long peduncle, creet, loosely flowered, (rarely 2, distant and with the upper one staminiferous above;) fruit oval-ovate, shortly beaked, subtriquetrous, inflated, nerved, smooth, orifice oblique, a little longer than the ovate acutish scale.

Hab. Meadows. Mass. May. Culm 1—2 feet high, purplish near the base. Fertile spikes 1—2. Plant dark green.

- §§§ Pistilliferous spikes on long peduncles, nearly destitute of sheaths.
- 73. C. umbellata Schk.: cespitose; fertile spikes mostly 4, ovate, few-flowered, one sessile at the summit of the culm, the rest on radical peduneles and appearing subumbellate; fruit ovate, acuminaterostrate, subpubescent, as long as the ovate acuminate glume.

Hab. Rocky grounds. N. Y. N. Eng. Penn. April, May. Culm 1—6 inches high. Leaves longer than the culm. Spikes 3—5, 6—8-flowered.

74. C. miliaeea Muhl.: fertile spikes 3, slender and cylindrical, nodding, slender and filiform; fruit ovate, triangular, without nerves, slightly rostrate, orifice entire, as long as the ovate-lanceolate glume.

HAB. Wet grounds. Can. to Geor. May. Culm 15 inches high. Spikes 1-2 inches long.

75. C. pallescens Linn.: fertile spikes 2-3, ovate-cylindrical, dense, at length somewhat nodding; fruit obovate-oblong, obtuse; sheaths and culm pubescent.

HAB. Wet grounds. Mass. and N. Y. Culm a foot high, sulcate. Fertile spikes 2—3, elliptic, thick, pale green.

76. C. hystericina Willd.: sterile spike pedunculate; fertile 2-3, thick, at length eermous, upper one inclusely pedunculate, the rest on exsert peduncles; fruit ovate, inflated, subhorizontal, many-nerved, rostrate, orifice bifid, twice as long as the oblong awned glume.

HAB. Wet grounds. Can to Geor. May. Culm 18 inches high, scabrous above. Plant yellowish-green.

77. C. pscudo-cyperus Linn.: fertile spikes 4, cylindrical, pedunculate, upper ones subgeminate; fruit oblong-lanceolate, rostrate, reflexed, many-nerved; apex divaricately bifid.

HAB. Swamps. Can. to Geor. June. Culm 2-3 feet high, thick, scabrous at the angles. Spikes 2 inches long, dense.

78. C. limosa Linn.: fertile spikes mostly 2, ovate or oblong-ovate, pedunculate, somewhat distant, pendulous; fruit suborbicular-elliptic, compressed, with a very short rostrum, (green,) orifice entire, as long as the ovate mucronate glume.—C. lenticularis Mich. Dew.

HAB. Swamps. Arc. Amer. N. Y. and N. Eng. June. Culm 9-24 inches high, very smooth. Glumes variable in length, ovate or oblong, acuminate or cuspidate.

79. C. hitchcockiana Devo.: sterile spike solitary, erect, peduncled; fertile ones mostly in threes, erect, pedunculate, lower one remote; flowers few and scattered; fruit subtriquetrous, oval, inflated, alternate both sides, recurved at the apex, striate, with a short truncate and open beak, nearly equal to the oblong or ovate mucronate scale.

Hab. Mountain woods. Mass. May. Culm 16-24 inches high, and with the leaves scabrous-pubescent. Fretile spikes 2-4. Plant dark green.—Allied to C. laxiflora, but distinguish-

ed by its fruit and rough pubescence.

** Staminifcrous spikes 2 or more.

1. With 2 stigmas.

80. C. cespitosa Linn.: sterile spike subsolitary, (or geminate;) fertile mostly 3, cylindrical, obtuse, distant, the lower on a short exsert peduncle; bracts strict; fruit ovate, somewhat acute, densely fruited in about 8 rows; orifice minute, longer than the ovate (black and margined) glume; leaves spreading.

HAE. Mountain bogs. Can. to Penn. May. Culm 12-18 inches high. Leaves dark green. Fruit ovate, nerveless, green.

81. C. crinita Lam.: sterile spikes geminate, (sometimes androgynous;) fertile 4, distant, pendulous, cylindrical, dense; fruit roundishovate, ventricose, slightly rostrate, orifice entire, much shorter than the linear glume.

b. gynandra S. & T.: fertile spikes 3, oblong-cylindrical; fruit

short-ovate, somewhat longer than the awned glume.

HAB. Swamps and meadows. Can. to Geor. June. Culm 2-4 feet high. Leaves pale green. Spike 2-3 inches long. June. Culm Var. b. has the culm about a foot and the fruit yellowish when

82. C. acuta Linn.: sterile spikes 1-3; fertile mostly 3, subpedunculate, somewhat nodding, cylindrical, remote; fruit oblong, entire at the orifice, as long as the oblong acute glume.

HAB. Wet grounds. Can. to Car. May. Culm 2 feet high, acutely triquetrous. Leaves subglaucous. Glumes brown.

83. C. aquatilis Wahl.: sterile spikes numerous or one erect, oblong, about 3-sided; fertile mostly 3, on short peduncles, cylindric, thickclavate-above, dense flowered, suberect, sometimes sterile at the apex; fruit elliptic, sublenticular, smooth, with the orifice entire and protruded, about equal to the ovate acutish scale.

Bogs. Mass. May. Culm 20-30 inches, erect.--Closely allied to the preceding, but differs in its larger and thicker densely flowered spikes, in its broader leaves, its almost obtuse

angled culm, and lighter colour.

With 3 stigmas:

84. C. barrattii Schw. & Torr.: sterile spikes subgeminate; fertile about 3, oblong-cylindrical, sterile at the summit, nodding, distant; fruit oblong, subtriquetrous, somewhat scabrous, orifice subentire; a little shorter than the ovate lanceolate glumes; leaves glaucous.

HAB. Sea coast. N. Y. May. Culm a foot high, rigid. Leaves

very smooth and glaucous. Glumes dark brown.

85. C. trichocarpa Muhl.: sterile spikes 2-4, pedunculate, (sometimes sterile at the summit;) fertile 3, distant, pedunculate, erect, oblong-cylindrical; fruit ovate-lanceolate, acuminate, bicuspidate. hairy, longer than the ovate acuminate glume.

HAB. Swamps. Can. to Geor. May. Culm 3 feet high. Fer-

tile spikes cylindric, thick.

86. C. filiformis Linn.: sterile spike geminate; fertile 2, ovate-oblong, sessile, distant; fruit elliptical, villous, bifurcate, as long as the ovate-lanceolate somewhat awned glume; leaves convolute.

HAB. Bogs. N. Y. Mass. N. J. W. to Mich. Culm 2-3 feet high. Leaves mostly radical, 2—3 feet long, filiform above.

- 87. C. vesicaria Linn.: sterile spikes 3; fertile mostly 2, pedunculate, cylindrical; fruit oblong, inflated, acuminate-rostrate, bicuspidate, longer than the lanceolate glume; culm acutely triquetrous.
 - Meadows. N. Y. Penn. W. to Mich. May. Culm 2 feet high. Spikes dense, 2-3 inches long.
- 88. C. ampullacea Willd.: sterile spikes 3; fertile 2-3, cylindrical. short pedunculate, erect; fruit subglobose, inflated, rostrate, bifurcate, longer than the lanceolate glume; culm obtusely triangular.

HAB. Meadows. Mass. N. to Arctic Amer.

89. C. retrorsa Schw. & Torr.: sterile spikes about 3, lower one often fertile at the base; fertile spikes about 5, approximate, (and clustered in a subcorymbose manner,) oblong-cylindrical, inclusely pedunculate, lowest one often remote; fruit ovate, inflated, reflexed, rostrate, half as long as the lanceolate glume.

IIAB. Near ponds. N. Y. and N. Eng. May. Culm 2 feet high. Fertile spikes thick. Fruit large.

90. C. schweinitzii Dew.: sterile spikes 2, upper one elongate, pedunculate; fertile 3, oblong-cylindrical, subpendulous, rather remote. inclusely pedunculate; fruit oblong-ovate, acuminate-rostrate, inflated, bifurcate, longer than the lanceolate attenuate glume.

HAB. Wet sandy soil. N. Eng. and N. J. June. Culm a foot high, rather slender. Spikes pale straw colour.

91. C. bullata Schk.: sterile spikes 3; fertile 2, oblong-cylindrical, rather loose, exsertly pedunculate and somewhat nodding, distant; fruit ovate-globose, inflated, erect, smooth, costate, rostrate-acuminate, orifice bifid, twice as long as the lanceolate glume.

HAB. Wet grounds. N. Y. Mass. Penn. Culm 18-24 inches high, slender, smooth. Fertile spikes remote, few-flowered.

92. C. pellita Muhl.: sterile spikes 2, oblong; fertile 2, eylindrical, remote, erect, upper one sessile; fruit ovate, subtriquetrous, shortrostrate, hairy, bicuspidate, equal to the oblong awned glume.

HAB. Wet grounds. Can. to Penn. May. Culm 2 1-2 feet high. Leaves rigid, flat, long.

93. C. lacustris Willd.: sterile spikes about 4; fertile 2-3, ereet, oblong-eylindrical, short pedunculate; fruit oblong, many-nerved, subrostrate, smooth, bifurcate, somewhat longer than the oblong mucronate glume.

HAB. Swamps, &c. Can. to Car. June. Culm 3-5 feet high. Leaves broad. Fruit brown.

94. C. longirostris Schw. & Torr.: sterile spikes 3, short; fertile 2-3, cylindrical, loose, at length pendulous, long-pedunculate, subdistant; fruit ovate, subglobose at the base, smooth, bifid, rostrum very long, longer than the lanceolate glume.

HAB. Wet meadows. N. Eng. W. to Mich. Gray.

feet high. Fertile spikes on filiform exsert peduncles.

UELLULARES, OR FLOWERLESS PLANTS.

Plants without flowers and spiral vessels, composed chiefly of cellular tissue—Acotyledones, Juss.—Cryptogamous or Ætheocamous Plants of Authors.

DIV. I. FILICOIDEÆ, OR FERN-LIKE PLANTS.

Obs. The following account of our Filicoid plants is the result of long and attentive study. In addition to my own collection, which embraces most of the American, and many foreign species, I have carefully examined the specimens in the herbarium of Muhlenberg, and in that of Mr. Schweinitz, which were generously loaned to me by that gentleman. I have also received specimens from friends in different parts of our country, especially from Dr. Asa Gray, N. Y., Dr. T. R. Ingalls, Louisiana, Prof. Hitchcock, Mass. To Dr. A. F. Holmes, of Montreal, I am indebted for an almost entire suite of Canadian ferns.

ORDER CXL. EQUISETACEÆ. De Cand. Lind.

Fructification in terminal spikes, composed of peltate several-sided scales, producing on their inner surface 4—7 elongated involucres, which contain the seeds. Seeds or sporules numerous, globose, surrounded by four elastic clavate filaments, which are dilated at the extremity.

Leafless plants, with whorled branches. Stem fistular, jointed; the joints separable and surrounded by membranous toothed sheaths.—The cuticle abounds in silex.

1. EQUISETUM. Linn.

Obs. The only genus of the order; the character therefore need not be repeated.

1. E. palustre Linn.: stems deeply furrowed, smooth, branched; branches simple, 5-sided, curved upwards; sheath subappressed, distant, cut at the apex into 10 fuscous teeth; spike oblong, blackish.

- HAB. Swamps. Arc. Amer. to Vir. May, June. 21.—Stems
 12—18 inches high, deeply sulcate and roughish; branches whorled and nearly erect. Spike an inch long, slender and blackish.
- 2. E. sylvaticum Linn. : branches of both the fertile and sterile stems compound, scabrous, curved downwards, 3- or 4-sided; sheath sloose. deeply cleft into membranous segments.

HAB. Low grounds. N. S. N. to Arc. Amer. May. 21.—
Stems 12-18 inches high.—Well characterized by its 4 or 5

whorls of compound branches.

3. E. hyemale Linn.: stems all simple, erect, very rough, naked, bearing spikes at the apex; sheaths short, whitish, black at the base and apex; teeth awned, at length caducous.

Hab. Woods and marshes. Can. and N. S. W. to Miss. June, July. 21.—Stems simple, 1—2 feet high, naked, furrowed, terminating in an oval head. Sheaths nearly equidistant, about 2 inches apart. Seouring Rush.

4. E. limosum Linn.: stems branched upwards, (sometimes simple;) branches simple, short, 5-sided, smooth; spike oblong or ovate; sheaths appressed .- E. uliginosum Willd. Pursh.

HAB. Borders of swamps. N. S. July. 21.—Stems 2-3 feet

high, erect, simple or with a few whorls of branches at the top. Sheaths numerous, short, with 15-20 narrow acute teeth. Spike brown, scarcely an incli long.

5. E. fluviatile Linn : sterile stems branching, somewhat scabrous; branches numerous, angled; fertile ones with broad sheaths; teeth long, cuspidate. - E. telmateia Ehrh.

HAB. Buffalo, N. Y., and the shores of Lake Superior. Torr. 24.—Fertile stems appearing first, a foot high. Sterile stems 2-5 feet high, with numerous joints and many long verticillate branches. Spike oblong.

6. E. arvense Linn.: sterile stems somewhat decumbent, with simple. square and scabrous branches; fertile ones erect, simple; sheaths in-

cisely toothed, cylindrical; teeth acute.

- HAR. Moist grounds. N. S. N. to Arc. Amer. April, May. 21.—Fertile stems appearing first, 6—8 inches high, with large ovate brownish spikes. Sheaths 3-5, swelling, whitish at base, ending in 6-8 long acute teeth. Sterile stems a foot or more high, jointed, with whorls of ascending branches, which are 3 or 4-cornered.
- 7. E. variegatum Smith: cespitose; stems somewhat branched at base, naked, filiform, scabrous, bearing a blackish spike at the top; sheaths 3-toothed, blackish; teeth membranaceous, lanceolate, whitish, deciduous at the tips .- E. scirpoides Mich. Pursh.
 - HAB. Woods on high grounds. Can. and N. S. N. to Arc. Amer. July. 24.—Stems 3—6 inches high, many from the same root, simple, filiform, 5-sided. Spike small, ovate, blackish. - Our plant differs in no respect from the foreign, except in

ORDER CXLI. FILICES. Juss. Lind.

Fructification only of one kind on the same individual. Capsules spiked or racemed, or mostly collected into clusters of various shapes (sori) upon the back of the leaf or frond, naked or covered with an involucre, often surrounded by an elastic ring and opening irregularly, or without a ring and opening with a regular fissure. Seeds or sporules minute.

Leafy plants with a horizontal stem or caudex (rhizoma.) Fronds before expansion, circinate, simple or variously branch-

ed and divided.

DIV. I. POLYPODIACEE. Capsules furnished with a vertical usually incomplete ring, bursting irregularly and transversely.

1. POLYPODIUM. Linn.

Sori roundish, scattered on various parts of the lower surface of the frond. Involucre none.

* Frond pinnatifid.

1. P. vulgare Linn.: frond smooth, deeply pinnatifid; segments oblong-obtuse, slightly serrate, the upper ones becoming gradually smaller; sori solitary—and P. virginianum Willd.

Hab. Rocky woods. Arc. Amer. to Car. W. to Miss. July. 21.—Fern 6-10 inches high. Root creeping, clothed with brownish chaffy scales. Stipe smooth. Sori large, in double rows, yellowish, at length dark coloured.

** Frond bipinnatifid.

2. P. hexagonopterum Mich.: frond bipinnatifid, rather smooth, the lower divisions deflexed; segments lanceolate, obtuse, ciliate; lower ones deeply crenate; upper ones very entire; the lowest adnate-decurrent; sori minute; stipe smooth.

IIAB. Moist woods. Can. to Car. July. 21.—Fern 12—18 inches high. Frond forming a triangle in its circumference, connected by a sort of hexagonal membrane; the 2—3 lower

divisions often deflected. Sori very minute.

3 P. phegopteris Linn.: frond bipinnatifid, the two lower divisions deflexed; segments linear-lanceolate, obtuse, entire, ciliate, the lower-most ones adnate-decurrent; veins hairy; sori solitary, marginal.—P. connectile Willd. and the American authors.

HAB. Shady woods. Throughout the U.S. July, Aug. 2f.—A careful comparison of specimens has satisfied me that our plant is not distinct from the foreign one. It differs from the preceding in having a chaffy stipe and larger sori. The whole fern also is smaller.

*** Frond ternate, bipinnate.

4. P. dryopteris Linn.: frond ternate, bipinnate, spreading and deflexed; segments obtuse, somewhat crenate; sori marginal; root

filiform, creeping.

Has. Hanover, N. H. Big. Arc. Amer.; rare. July. 21.— Fern a foot high. Root black, creeping and slender. Stipe slender, smooth and crect. Frond drooping, tender and of a light green colour.—Often confounded with the next, from which it is distinct.

5. P. calcarcum Smith: frond ternate, bipinnate, erect, rather rigid; segments somewhat obtuse, subentire; sori marginal, conflu-

ent .- Nephrodium dryopteris Mich.

Hab. Wet shady grounds. Can. to Penn. July. 21.—Differs from the preceding in its more rigid habit, its somewhat duller green and paler confluent sori, as was first shown by Sir J. E. Smith. Mr. Charles S. Parker, of Liverpool, a very accurate botanist, informs me that P. dryopteris and calcareum are found in one locality, near Matlock, (Eng.) and that they preserve their distinct characters in cultivation.

2. ONOCLEA. Linn.

Capsules covering the whole lower surface of the frond. Involucre formed of the frond turned inwards, resembling a berry, opening but not expanding.

- 1. O. sensibilis Linn.: sterile fronds pinnate; pinnæ lanceolate, acute, laciniate, upper ones united; fertile fronds bipinnate, resembling a compound spike, with recurved globular segments; rachis smooth.
 - HAB. Moist woods. Can. to Flor. July. 21.—Fronds several, 12—18 inches high, with a long and smooth stipe; the fertile ones very narrow.
- 2. O. obtusilobata Schl.: sterile fronds pinnate; pinnæ opposite, pinnatifid; segments rounded, lower ones gradually smaller, upper ones united; fertile fronds bipinnate; pinnules incised, recurved-globose, villose; stipe scaly.—O. sensibilis var. obtusilobata Torr.

HAB. Low grounds. Penn. Pursh. N. Car. Schweinitz. July.
21.—Smaller than the preceding, and has the pinnæ opposite, with rounded segments.—Mr. Schweinitz considers it quite dis-

tinct.

3. ASPIDIUM. Swartz.

Sori roundish or elliptical, scattered. Involucre roundish or kidney-shaped, umbilicated or opening on one side.

* Frond pinnate.

1. A. acrostichoides Willd.: frond pinnate; pinnæ lanceolate, falcate, acute, ciliate-serrate, auricled at the upper angle of their base,

subsessile, upper ones smaller and alone fertile; sori at length confluent; stipe and rachis chaffy.—Nephrodium acrostichoides Mich.

- Hab. Rocky and low sliady places. Can. to Car. W. to Miss. June—Aug. 21.—Forn 12-18 inches high. Stipe short, pale and with the rachis chaffy. Frond long, pale green. Sori in a single or double row, at length confluent.
- 2. A. schweinitzii Beck: frond pinnate; pinnæ linear-lanceolate, falcate, doubly serrate, auricled at the upper angle of their base; sori on the upper pinnæ, distinct, in two rows, one on each side of the midrib.
 - Hab. N. J. Schweinitz. Near Philadelphia. Conrud.—Fern larger than the preceding and differing considerably in its appearance. Pinnæ, especially the lower ones, deeply and doubly dentate-serrate, the teeth or serratures armed with stiff bristles. Sori continuing perfectly distinct.—Nearly allied to A. auriculatum of Swartz, and may be the same as that mentioned by Sir J. E. Smith under the description of that plant, (Rees' Cycl. Supp. art. Aspidium,) said to have been brought from the N. W. Coast by Menzies.

** Fronds bipinnatifid.

- 3. A. thelypteris Willd.: frond pinnate; pinnæ lanceolate, deeply pinnatifid, distinct, but sometimes crossing each other at base; segments oblong, acute, somewhat crenate, ciliate; sori marginal, at length confluent.
 - Hab. Wet woods and swamps. Can and N. S. July. 21.— Fern a foot or more high. Root creeping. Stipe smooth; rachis and midrib often a little hairy. Frond lanceolate, deep green and delicate.
- 4. A. noveboracense Willd.: frond pinnate; pinnæ linear-lanceolate, deeply pinnatifid; segments oblong, obtuse, entire, ciliate; sori marginal; stipe smooth.—A. thelypterioides Swartz.—Nephrodium thelypterioides Mich.
 - Hab. Damp woods. Can. to Car. July. 2f.—Fern about the size of the last but of a more rigid habit. Segments of the pinnæ usually quite entire and obtuse. Sori at length confluent and partly covered by the margin of the frond.—Closely resembles the preceding, from which it may still not be distinct.
- 5. A. cristatum Willd.: frond pinnate, nearly bipinnate, lanceolate-ovate; pinnæ subcordate, oblong, pinnatifid; segments oblong, obtuse, dentate-serrate; stipe scaly.—Nephrodium cristatum Mich.
 - HAE. Moist grounds. Cau. and N. S. July. 2f.—Fern a foot or more high. Frond pale green, with a lanceolate-ovate outline. Sari large, in double rows, tawny when mature, mostly on the upper half of the frond.
- 6. A. lancastricase Spreng.: pinnæ subopposite, lower ones triangular-ovate; segments toothed; stipe nearly naked.
 - HAR. Woods. N. Y. Mass. N. J.; not common. July. 21.

 -Forn 18-24 inches high. Stipe nearly smooth. Frond large, much narrower and more rigid than in the preceding; it is also

of a darker green. Sori large, distinct, very dark when mature.

7. A. goldianum Hook.: frond pinnate; pinnæ deeply pinnatifid, lanceolate, acuminate; segments oblong, subacute, somewhat falcate, mucronate-serrate; sori in rows, one between the midrib and either margin of the segments.—A. filix mas Pursh.

HAB. Woods. Can. and N. S. July. 21.—Fern 1 1-2—3 feet high.—Resembles A cristatum more than any of our species, but can at once be distinguished by the greater breadth of the frond, giving it a different outline, and by the form of the pinna, which are never broader at base; the segments also are longer and narrower, and slightly falcate.

*** Fronds bipinnate.

- 8. A. fragile Willd.: frond bipinnate; pinnules oblong, rather obtuse, incisely serrate or subpinnatifid; segments subentire; rachis winged; stipe chaffy at base.—A. tenue Pursh.—A. atomarium Willd.—Cyathea fragilis Smith.—Nephrodium tenue Mich.—Athyrium fragile Richardson.
 - Hab. Moist rocks. N. Y. Ver. Mass. N. to Arc. Amer. June, July. 21.—A beautiful little fern, growing in lax tufts, 6—14 inches high. Stipe long and slender, dark coloured and a little chaffy at base. Frond delicate, deep green. Pinnules very variable in shape and in their divisions, some being quite acute, others obtuse and wedge-shaped. Sori large, numerous, pale, near the margins of the segments. Involuce somewhat cyathiform, at length lacerate and reflexed.—Our plant agrees precisely with the foreign, and I have no doubt of their identity.
- 9. A. marginale Willd.: frond bipinnate; pinnæ lanceolate; pinnules oblong, obtuse, decurrent, crenate, lower ones almost pinnatifid at base; sori marginal; stipe chaffy.—Nephrodium marginale Mich.

HAB. Rocky woods. Can. to Car. July. 21.—Fern 12-18 inches high. Stipe chaffy especially near the root. Frond light green, the upper part only fruit-bearing. Involucre orbicular, with a lateral sinus.

- 10. A. spinulosum Willd.: frond bipinnate; pinnules oblong, decurrent, with deep cut prickly serratures; involucre orbicular, with a lateral sinus—and A. aculcutum Pursh.?
 - HAB. Shady woods. Penn. to Vir. July. 21. Pursh.—Stipe long, scaly at the lower part. Frond broad, with the segments decurrent so as to form a border to the partial rachis. Sori small and rather distinct.—Doubtful as an American plant.
- 11. A. dilatatum Willd.: fron 1 bipinnate; pinnules oblong, distinct, incisely pinnatifid; segments mucronate-serrate; stipe chaffy ad A. intermedium Willd. Muhl.
 - Han. Shady woods. Can. and N. S. July. 21.—Fern 1—2 feet high. Stipe long and chaffy. Frond varying in the division of the pinnæ, being sometimes scarcely bipinnate, but sometimes almost tripinnate. Sori numerous, rather large, distinct, brownish when mature.

- 12. A. bulbiferum Willd.: frond bipinnate, lanceolate, attenuate above; segments opposite, oblong, obtuse, serrate, the lower ones pinnatifid; rachis bearing bulbs; sori minute.—Nephrodium bulbiferum Mich.
 - Hab. Wet rocks. Can. and N. S.; common. July. 24.—
 Fern 12—18 inches high. Stipe smooth, pale. Frond narrow, much attenuated at the summit, fine green and smooth.
- 13. A. filix famina Willd.: frond bipinnate; pinnules oblong-lanceolate, incisely serrate; serratures few-toothed, somewhat acute; sori oblong, straight.—Asplenium filix-famina Spreng.
 - Hab. Low shady grounds. Can. to Vir. Pursh. Bethlehem, Penn. and N. W. Terr. Schweinitz. July. 21.—Fern growing in tufts, I 1-2—2 feet high. Frond with the general outline oblong-lanceolate. Sori small, one on each segment of the pinnules, inserted laterally into its minute midrib, oblong and straight, but at length by the pushing back of the involucre becoming kidney shaped and appearing nearly round, but always remaining distinct.
- 14. A. asplenioides Willd.: frond bipinnate; pinnules linear-lanceolate, incisely serrate; serratures 2-3-toothed; sori oblong, lunate, at length confluent.—Nephrodium asplenoides Mich.—Asplenium athyrium Spreng.
 - Hab. Shady woods. Throughout the U. S and Can. July. 21.—Resembles the preceding, but has a broader outline, and has the sori longer and lunate and parallel to each other, giving it the appearance of an Asplaniam. The involucre is larger and remains firmly attached to the frond, &c.
- 15. A. angustum Willd.: frond bipinnate; pinnules lanceolate, incisely-serrate; serratures sub-bidentate; lower tooth longer; sori oblong lunulate; stipe smooth.—Nephrodium filix famina Mich.—Asplenium michauxii Spreng.
 - Han. Shady woods. Can. to N. Car. July. 21.—Though allied to the two preceding, this appears to be a good species. The frond is smaller, being seldom more-than a foot high; it has also a narrower outline.—Dr. Hooker, however, considers it a narrow-fronded variety of A. filix famina.

4. WOODSIA. Brown.

Sori roundish, scattered, having beneath an involucre which is cut at the edge into many capillary segments.

- 1. W. iltensis Eroun: frond pinnate; pinnæ lanceolate, deeply pinnatifid, with numerous nearly uniform oblong segments.—Polypodium ilvense Willd.
 - HAB. Rocky banks of streams. Can. and N. S. June. 21.
 Fern 4-6 inches high, in dense tufts. Stipe brownish and sealy below. Frond oblong or lanceolate; pinnæ about 12, alternate.
 This is not the W. ilvensis of Pursh.
 - 2. W. hyperborca Brown: frond pinnate; pinnæ somewhat cordate,

rounded, pinnatifid; segments rounded, unequal.—Polypodium hyperboreum Willd.

- HAB. Rocks. Can. and N. S. July. 21.—Resembles the preceding, but is sometimes quite small, and differs in having the pinnæ as well as the segments more rounded and less deeply pinnatifid, except at their base, where the bottom pair of segments are often so deeply separated as to form two little pinnules.
- 3. W. rufidula Beck: frond bipinnate; pinnules hairy, oblong, obtuse, pinnatifid, with obtuse segments; sori at length confluent; stipe and rachis hairy.—Aspidium rufidulum and Woodsia ilvensis Pursh.—Nephrodium rufidulum Mich. Woodsia ilvensis? Big. Richardson's App.
 - HAE. Rocks. Subare. Amer. to Car. July. 21.—Fern 6—8 inches high. Stipe dark brown, densely elothed with lighter eoloured woolly hairs. Frond decidedly bipinnate in full grown specimens, hairy on both sides.—The W. ilvensis and hyperborea of Brown resemble each other closely. This differs from both in its bipinnate frond and in its hairy instead of sealy stipe, rachis and frond.
- 4. W. perriniana Hook. & Grev.: minutely glandular-pilose; frond bipinnate; pinnules pinnatifid; segments rounded, bidentate; sori submarginal; involucre subhemispheric, at length with dentate spreading segments; spike somewhat chaffy.—Alsophila perriniana Spreng.—Hypopeltis obtusa Torr. Aspidium obtusum Welld. Pursh.

 Hab. Rocks. N. Y. to Car.; rather rare. July. 21.—Fern
 - Hab. Rocks. N. Y. to Car.; rather rare. July. 21.—Fern 8—10 inches high, ereet. Slipe straw coloured. Sori at length much crowded together.—Habit similar to the Woodsias, "and except that the involucre is larger in proportion to the sorus, and that in the young state it covers more fully the eapsule, and is not margined with hairs, there is not a difference even in the characters of the fructification."—Hook. & Grev. Icon. Filic.

5. ASPLENIUM. Linn.

Sori linear, transverse, scattered. Involucre arising from the lateral veins and opening towards the central nerve or rib.

* Frond undivided.

1. A. rhizophyllum Willd.: frond lanecolate, stipitate, subcrenate, aurieulate-cordate at base, the point very long filiform and rooting.

b. pinnatifidum Muhl: fronds pinnatifid at base; lobes roundishovate; the lower ones crenate.—A. pinnatifidum Nutt.

HAB. Wet rocks. Can. to Car. July. 21.—Fronds several from the same root, 6—10 inches long, somewhat triangular, with a very long and linear point, which is bent to the ground and strikes root. Var. b. passes into the former by seareely perceptible variations.

** Frond pinnate.

2. A. angustifolium Mich.: frond pinnate; pinnæ alternate, upper ones subopposite, linear laneeolate, serrate towards the point, some-

what repand, the base truncate on the upper side, rounded on the lower.

- HAB. Moist woods. Can. and N. S. July. 24.—Fern 12—18 inches high. Sterile fronds forming a circle with the fertile ones smaller and central. Sori diverging like veins from the midrb, at length confluent.
- 3. A. ebeneum Willd.: frond pinnate; pinnæ sessile, lanecolate, somewhat falcate, serrate, auricular on the upper side of their base; spike smooth and polished—A. trichomanoides Mich.—A. polypodioides Swartz. Muhl.
 - Hab. Rocky woods. Can. to Car. July. 21.—Fern 6—10 inches high. Stipe brown, polished, slender and simple. Frond narrow, pale green, smooth. Sori in short diverging lines, arranged in a double row.
- 4. A. trichomanes Linn.: fronds pinnate; pinnæ roundish-oblong, obtuse, crenate, the base truncate and somewhat euneate; stipe smooth and dark coloured—and A. melanocaulon Willd.
 - HAB. Shady rocks. Can. to Car. July. 24.—A delicate fern 4—8 inches high. Stipe shining, blackish-purple. Frond dark green. Sori linear, 5—6 to each pinnule, becoming roundish when old.—Distinguished from the preceding by its smaller size and by having the pinne roundish, and acute at base.

*** Frond bipinnatifid.

5. A. thelypteroides Mich.: frond pinnate; pinnæ lanecolate, sessile, acuminate, pinnatifid; segments oblong, obtuse, denticulate.

Hab. Shady banks of streams. Can. to Car. July. 24.—Fern 1—2 feet high. Stipe smooth, not coloured. Frond ovate, fine green; pinuæ long, pinnatifid. Sori oblong and oblique, forming two rows, one on each side of the partial ribs.—Resembles Aspidium thelypteris.

**** Frond bipinnate.

6. A. ruta-muraria Linn.: frond bipinnate at the base, simply so at the top; segments rhomboid-wedge-shaped, obtusely denticulate at the extremity.

HAB. Rocks. N. Y. to Car.; not common. July. 21.—A small fern growing in tufts, 2—4 inches high. Frond spreading, rather rigid, glaucous green, bi- and tri-pinnate. Sori linear, slightly oblique, at length darker and confluent.

7. A. montanum Willd.: frond smooth, bipinnate; pinnules oblongovate, pinnatifid; segments 2-3 toothed at the apex -1. adiantum nigrum Mich.

HAB. Mountain rocks. Bethlehem, Penn. S. to Car. Schweinitz. July. 21.—A fern growing in tufts, 4–8 inches high. Frond having a narrow outline, mostly bipinnate; but more or less divided according to its size. Sori linear, at length confluent.—Differs from the foreign A. adiantum nigrum in being much smaller, and in having the segments more obtuse.

6. WOODWARDIA. Smith.

Sori oblong, distinct, parallel with the ribs of the frond on either side. Involucre superficial, arched, separating towards the rib.

1. W. onocleoides Willd.: sterile frond pinnatifid; segments lanceolate, repand, slightly serrulate; fertile frond pinnate; segments linear, entire, acute.—W. angustifolia Smith. Muhl.

Hab. Swamps. Can. to Flor.; not common. Aug. 24.—
Fern a foot high, growing in tufts. Frond lanceolate, tapering
at the top. Sori a 1-4 of an inch long, at length nearly cover-

ing the back of the pinnæ.

2. W. rirginica Willd.: frond very smooth, pinnate; pinnæ sessile, lanceolate, pinnatifid; sori in interrupted lines near the midrib of the pinnæ and segments.—W. banisteriana Mich.

HAR. Swamps. N. Y. to Geor. July. 21.—Fern 2 feet high. Stipe smooth. Frond having a lanceolate outline, light green, with the segments acute and falcate. Sori in double lines, at length confluent.

7. SCOLOPENDRIUM. Smith.

Sori linear, transverse, scattered. Involucre double, occupying both sides of the sorus, superficial, at length opening longitudinally.

S. officinarum Willd: frond simple, ligulate, entire, cordate at base.

-Asplenium scolopendrium Linn.

Hab. Shady woods among loose rocks near Onondago, N. Y. Pursh. July. 21.—Frond subcrect, on rather a short stipe, 8—15 inches long, 2—3 wide, fine green, paler beneath. Sori 1-2 to 3-4 of an inch long, oblique to the midrib.—Pursh could hardly have been mistaken in this plant, and yet it is singular that it has never been found in our country by any other botanist.

8. PTERIS. Linn.

Sori in a continuous marginal line. Involucre formed of the inflected margin of the frond, opening inwards.

- 1. P. atropurpurea Linn.: frond pinnate; lower divisions ternate or pinnate; segments lanceolate, obtuse, very entire, obliquely truncate or subcordate at base.
 - Hab. On rocks. N. Y. to Car. July. 21.—Fern 6—10 inches high. Stipe purple or dark brown, villous. Frond light green on the upper surface, grayish beneath. Sori marginal, conspicuous.
- 2. P. gracilis Mich.: frond pinnate; pinnæ lanceolate, obtuse, alternate, sessile, lower ones pinnatifid; fertile ones entire; sterile ones crenate, round-obtuse.—Cheilanthes gracilis Spreng.

- HAB. On rocks. Can. and N. S. Aug. 24.—Smaller and of a much more delicate habit than the last. Frond with the stipe 4-6 inches high, smooth and shining.—Specimens of this plant which I found in abundance on the rocks near Whitehall, N. Y., were collated by Dr. Hooker and determined to be the true P. gracilis, and he also remarks that he cannot comprehend why Kaulfuss and Sprengel should make it a Cheilanthes.
- 3. P. aquilina Linn.: frond 3-parted; branches bipinnate; pinnæ linear-lanceolate, lower ones pinnatifid, upper ones undivided; segments oblong, obtuse.
 - HAB. Dry woods. Can. to Flor. July. 21.-Fern 2-6 feet high, according to the soil. Stipe angular, dark coloured and polished, dividing into large opposite branches. Frond very large, pale green .- Dr. Hooker thinks that the plant which passes under this name among our botanists is the next.
- 4. P. caudata Linn.: frond pinnately 3-parted; sterile divisions bipinnate, with the segments linear, long, obtuse, and very entire; fertile divisions pinnate; segments rather remote, the lower ones pinnatifid, dentate at the base.
 - HAB. Rocky woods near streams. Penn. to Car. Pursh. Aug. If Dr. Hooker's opinion is correct, this species is very common in the N. S.

9. ADIANTUM. Linn.

Sori oblong or roundish, marginal. Involucre membranaccous, arising from distinct portions of the frond turned in. opening inwards.

A. pcdatum Linn.: frond pedate; divisions pinnate; pinnæ oblong. somewhat lunate, with the upper margin incised; sori linear, stipe smooth.

HAB. Shady woods. Can. to Vir. Louis. Raf. July. 2f .-Fern 1-2 feet high, easily known by its long slender black and highly polished stipe, and its pedate nearly horizontal frond.

10. CHEILANTHES. Swartz.

Sori roundish, distinct, situated at the margin of the frond. Involucre of membranous distinct inflexed scales, opening inwards.

C. vestita Willd.: frond bipinnate, hairy on both sides; pinnules pinnatifid; segments rounded, oblong, very entire; stipe and rachis hairy.

HAB. Rocks. Penn. to Car. W. to Rocky Mountains. July. 21.—Fern 6-8 inches high, and covered with long brownish hair. Sori at length contiguous.

11. HYMENOPHYLLUM. Smith.

Sori in separate spots at the margin of the frond. Capsules sessile, inserted on a common cylindrical receptacle, within a 2-valved involucre of the same texture as the frond; valves plane, outer one free.

H. ciliatum Smith: frond pinnate; lower divisions larger; upper ones gradually smaller, pinnatifid; segments linear-obtuse, bifid, ciliate, hairy on the veins; stipe and rachis winged and ciliate.—Trichomanes ciliatum Swartz.

HAB. Trunks of trees in shady places. Penn. and Vir. 21.— Pursh.

12. STRUTHIOPTERIS. Willd.

Cupsules densely covering the back of the frond. Involucre scaly, marginal, opening internally.

S. germanica Willd.: sterile fronds pinnate; pinnæ pinnatifid, sessile; segments entire, rather acute; the lower ones somewhat elongated—and S. pennsylvanica Willd.—Onoclea struthiopteris Swartz.—O. nodulosa Schl. Mich.

HAB. Low grounds. Can. and N. S. July. 4.—One of our largest ferns, the sterile fronds being often 3 feet high and arranged in a circular form, with a few much smaller fertile ones in the centre.—I think there can be no doubt of the identity of our plant with the foreign S. germanica.

13. DICKSONIA. L'Herit.

Sori punctiform, marginal, roundish and distinct. Involucre double; outer one superficial, opening outwards; the other marginal and opening inwards.

D. pilosiuscula Willd.: frond bipinnate; pinnules decurrent, oblong-ovate, pinnatifid segments incisely dentate; sori solitary, minute; stipe and rachis hairy.—D. pubescens Schk.—Nephrodium punctilobum Mich.—Aspidium punctilobum Willd. Pursh. Torr.

Hab. Shady places. Can. to Vir.; common. July. 24.— Fern 2—3 feet high, growing in tufts, of a delicate habit. Stipe nearly smooth below, but becoming hairy as it passes into the rachis. Frond large and long, lance clate, somewhat acuminate, yellowish-green. Sori solitary, minute, near the divisions of the segments.—A true Dicksonia.

DIV. II. OSMUNDAEE. Capsules destitute of a ring, reticulated, striated with rays at the apex, opening lengthwise and usually externally.

14. OSMUNDA. Linn.

Capsules subglobose, pedicelled, radiate-striate, or wrinkled, 2-valved, with a hinge at the joining of the valves, either occupying the lower surface of the contracted frond, or disposed in the shape of a raceme or panicle. *Involucre* none.

* Leafy frond bearing fruit.

1. O. claytoniana Linn.: frond pinnate; pinnæ pinnatifid, with

smaller fertile ones at the top.

IIAB. Wet grounds. Cambridge, N. Y. Stevenson. Penn. Conrad. May. 21.—Frond 12—18 inches high; pinnæ obtuse, tomentose at the axils; segments entire. Fruit terminal, bipinnately panicled, erect, ferruginous.—Identified by Muhlenberg with O. interrupta Mich., and by Pursh with O. cinnamomea. From the former it differs in having the fructification terminal, and from the latter by laving the pinnæ more obtuse, the segments closer and not so deep, and by not being lanuginous. See Conrad in Jour. Phil. Acad. vi. 39.

2. O. interrupta Mich.: frond pinnate, smooth; pinnæ nearly opposite, pinnatifid; segments oblong, subacute, entire; some of the intermediate pinnæ fruit-bearing.

HAB. Low grounds. Can. to Vir. June. 24.—Fern 1—2 feet high. Frond with 2 or 3 central pairs of pinnæ fertile dark

brown and shorter than the sterile ones.

3. O. spectabilis Willd.: frond bipinnate, all fruit bearing at the summit; pinnules oblong, distinct, serrulate; raceme very large, decompound.—O. regalis Mich. Torr.

HAB. Low grounds and swamps. Can to Ffor. July. 24.—Fern 3—4 feet high, of a grayish colour, with numerous spreading branches.—Differs from the foreign O. regalis by its being smaller, and of a more rigid texture, and by the distinct petiolation of the pinnules which are not lobed at base.

** Fertile fronds separated.

4. O. cinnamomea Linn.: sterile frond pinnate; pinnæ pinnatifid; segments ovate-oblong, obtuse, very entire; fertile frond bipinnate, woolly, contracted; stipe woolly.

HAB. Low grounds. Can. to Flor. Aug. 24.—Sterile fronds from 2—5 feet high, arranged in bundles or circles, with a few

much smaller fertile ones in the midst.

15. LYGODIUM. Swartz.

Capsules sessile, ovate, in 2-ranked little spikes, which issue from the margin of the frond, radiate-striate, or wrinkled, opening on the inner side, from the base to the summit. Involucre scale-like, covering each capsule.

I. palmatum Swartz.: stem flexuous and climbing; fronds conjugate, cordate, palmate, with 5 lobes; lobes entire, obtuse; spikelets oblong-linear, in a compound terminal spike.—Hydroglossum palmatum Willd. Pursh.—Cteisium paniculatum Mich.

HAB. Low woods. Mass. to Car.; rare. July. 21.—Stem climbing, 3—4 feet long, smooth and slender. Petioles alternate, forked at a short distance from the stem, and supporting 2 leaves or fronds, which are divided into 5—9 oblong obtuse

lobes. Fertile fronds variously divided into small linear segments, with the sori in 2 imbricated rows.

16. SCHIZEA. Smith.

Spikes unilateral, flabellate, aggregate. Capsules with radiating furrows at the top, somewhat turbinate, bursting laterally, sessile. Involucre continuous, formed of the inflexed margin of the spikes.

S. pusilla Pursh: frond simple, linear-compressed, tortuous; spikes few, conglomerated at the summit of a long slender stipe. -S. tortuosa Muhl.

HAB. Pine barrens near Quakers' Bridge, N. J. Aug. 21.-A very small fern, with numerous cespitose fronds, which are about 2 inches long. Stipe 3—5 inches long, filiform, with a few brownish secund spikes.—It has been found in Newfoundland and in the Falkland Islands, but the only intermediate locality known is that of N. J.—Cooper in Ann. N. Y. Lyc. ii. 266.

DIV. III. OPHIOGLOSSEE. Capsules of one cell, adnate at the base, subglobose, coriaceous, opaque, destitute of a ring, not cellular, (sometimes connate,) half 2-valved.

17. OPHIOGLOSSUM. Linn.

Capsules round, smooth, 1-celled, 2-valved, transversely opening, disposed upon an articulated 2-ranked spike.

1. O. vulgatum Linn. : spike cauline; frond simple, oblong-ovate,

obtuse, closely reticulate.

- HAB. Low woods. N. S. June. 21.—Fern smooth and succulent, 6—8 inches high, bearing a single entire subsessile frond. Spike about an inch long, on a slender peduncle.—Dr. Gray has found 2 or 3 specimens of a fern which resembles this in its specific character, but is scarcely 2 inches high. It may prove on further examination to be a distinct species. If so, I would propose for it the name of O. Grayi.
- 2. O. bulbosum Mich. : spike cauline, short ; frond subcordate, ovate, somewhat obtuse; root bulbous. - O. crotalophoroides Walt.

HAB. Low grounds. N. J. to Car. May. 21.-Fern 6 inches high. Frond 1 1-2 inch long and an inch broad, reticulate.

18. BOTRYCHIUM. Swartz.

Capsules subglobose, 1-celled, 2-valved, distinct, sessile, smooth, coriaceous, disposed in spikes or racemes, opening transversely.

1. B. simplex Hitchcock: scape with one frond above; frond ternate, pinnatifid; segments cuneate, obovate, incised. HAB. Dry woods. Can. N.Y. & Mass. June. 21.-Fern 2-6 in-

ches high. Frond solitary, from a torn membranaeeous sheath, divided into 3 or 4 unequal segments or pinnatifid; the segments often much cut. Spike subcompound, unilateral and interrupted.—See Hitchcock in Sill. Jour. vi. 103.

- 2. B. fumarioides Willd.: scape naked; frond smooth, radical, 3-parted, bipinnate; pinnules lunate, crenate; spikes bipinnate, and B. obliquum Muhl.—B. fumarioides var. obliquum Torr.—Botrypus lunarioides Mich.
 - HAB. Shady woods. N. Y. to Car. June. 21.—Fern 9—12 inches high. Frond petioled, mostly ternate, but often more compound; segments lunate, closely resembling those of B. lunaria. Capsules in double rows on the branchlets.—I have carefully examined an authentic specimen of B. obliquum in the herbarium of Mr. Schweinitz, but can observe nothing to distinguish it from this species.
- 3. B. dissectum Willd.: scape with the frond near the base; frond ternate, thrice pinnatifid; segments decurrent, linear, wedge-shaped, sharply toothed at the end.
 - HAR. Dry woods. Near Philadelphia. Conrad. Washington City. Collins. N. Y. to Flor. Pursh. June. 21.—Easily distinguishable from the next by its smaller size, and by the much more finely divided segments of the frond.
- 4. B. virginicum Swartz: scape bearing the frond in the middle; frond 3-parted, bipinnatifid; segments obtuse, about 3-toothed; spikes bipinnate, divaricate—and B. gracile Pursh.—Botrupus virginicus Mich.

HAB. Shady woods. Can. to Car. June, July. 21.—Fern often 18—20 inches high. Frond near the middle of the stipe, divided into 3 principal branches, which are again variously divided. Spike pinnate or bipinnate, smooth or a little hairy.

ORDER CXLII. LYCOPODIACEÆ. De Cand. Lind.

Fructification axillary or spiked, composed of two kinds of 1—3-celled, 2—3-valved capsules, some containing minute granules, others a few larger corpuscules. Stems herbaceous or woody, simple or branched, erect or creeping. Leaves undivided, small, numerous.

1. LYCOPODIUM. Linn.

Capsules 1-celled, axillary, sessile; some 2-valved, filled with a farinaceous substance; others 3-valved, containing 1—6 globose corpuscules.

* Spikes peduncled.

1. L. carolinianum Linn.: stem creeping; leaves somewhat 2-ranked, spreading, lanceolate, very entire; peduncle erect, solitary, elongated, 1-spiked; bracts sublanceolate, entire.

HAB. Low grounds. Mass. to Car. July. 24 .- A creeping

plant, keeping close to the ground in muddy soils. Pedunele erect, 3-4 inches high, slender, with a single spike.

- 2. L. eluratum Linn.: stem creeping, with ascending branches; leaves scattered, incurved, ending in hairs; spikes in pairs, rarely in threes, cylindrical, pedunculate; scales ovate, acuminate, erosely denticulate.—L. tristachium Nutt. not of Pursh.—L. integrifo!ium Goldie.
 - HAB. Pine woods, Can. and N. S. W. to Michigan. July.
 21.—Stem closely trailing on the ground, very long, rooting and throwing up fertile branches 4-6 inches high. Leaves linear-lanceolate, entire or serrulate. Spikes yellowish, erect.
- 3. L. complanatum Linn.: stem trailing, with dichotomous branches; leaves 2-rowed, connate, spreading at the tips; superficial ones solitary, appressed; peduncles elongated, supporting 4 terete cylindrical spikes.
 - HAB. Woods. Can. to Car. N. to Arc. Amer. July. 21.—
 Stem 2—10 feet long, dichotomously branched. Leaves 4-rowed, short; two larger 2-rowed; smaller ones close pressed to
 the flattened sides of the stem. Spikes 2—4, on elongated peduncles.
- 4. L. sabinafolium Willd.: stem erect; branches alternate, dichotomous; leaves lanceolate, acute, in 4 rows, appressed, convex; spikes terete; scales subcordate, acuminate.—L. alpinum Mich.
 - HAB. White Mountans, N. H. N. to Labrador. W. to Michigan. July. 21.—This species, of which I have specimens from the White Mountains, which agree in all respects with those in the Herbarium of Mr. Schweinitz, differs strikingly in appearance from L. alpinum.—The stem is erect, the leares are large and somewhat spreading, lanceolate, acute or acuminate, sometimes denticulate. The whole plant also is larger, and the branches much longer.

** Spikes sessile.

t Leaves in all directions.

5. L. dendroideum Mich.: stem erect; branches alternate, crowded, dichotomous, erect; leaves linear-lanceolate, in 6 equal rows, spreading; spikes numerous, terminal, sessile.

b. obscurum Torr.: branches spreading; spike mostly solitary, sessile.—L. obscurum Linn. Big.

- Hab. Shady woods. Can. to Car. July. 21.—Stem 6—8 inches high, with numerous erect branches. Spikes 1—4 on each plant, an inch long, with broad ovate scales.
- 6. L. annotinum Linn.: stem creeping; branches ascending, dichotomous; branches simple; leaves in 5-rows, linear-lanceolate, mucronate, serrulate, spreading; spike oblong, solitary, sessile, terminal.
 - Hab. Mountain woods. N. S. N. to Arc. Amer. July. 21.

 —Stem creeping, sending up 4-8 ascending branches, which are 6-8 inches high. Leaves spreading and somewhat reflexed

when the plant is advanced. Spike solitary, about an inch long.—Resembles L. sabinafolium, but may be distinguished by its leaves.

- 7. L. inundatum Linn.: stem creeping, somewhat branching; branches simple, solitary, ereet, with a single sessile leafy spike at the extremity; leaves linear, seattered, acute, entire, curved upwards.
 - HAR. Cedar swamps. Can. to N. Y. Pursh. N. to Hudson's Bay. July. 21.—Flowering branches subradical, 3—6 inches long. Leaves linear, entire, with the floral ones somewhat dilated at base and spreading. Spike short, leafy.
- 8. L. selaginoides Linn.: stem filiform, creeping; branches suberect, the flowering ones simple; leaves scattered, lanceolate, somewhat spreading, ciliate-denticulate; spike terminal, solitary, sessile, leafy.
 - Hab. Moist woods. Can. and N. S. July. 21.—Fertile branches 2—4 inches high, nearly erect, yellowish-green. Leaves of the fertile branches larger. Spike nearly an inch long, leafy.
- 9. L. alopecuroides Linn.: stem creeping, somewhat branched; branches nearly simple, elongated, ascending, with a single sessile leafy spike at the summit; leaves linear-subulate, ciliate-dentate at base, spreading.
 - HAB. Sphagnous swamps. N. Y. to Flor. Aug. 24.—Stem long; branches densely leaved, 6—8 inches high. Leaves narrow, shining and somewhat spreading. Spike solitary, more than an inch long, very leafy. Walking Fern.
- 10. L. rupestre Linn.: stem ereeping, with ascending subdivided branches; leaves scattered, imbricate, linear-lanceolate, ciliate, ending in hairs; spike solitary, sessile, terminal.
 - HAB. Rocks and side hills. Can. to Car. July. 21.—A small creeping plant of a grayish-green colour, differing much in appearance from the other species. Leaves many-rowed, ending in hairs, which give the summit of the branches a whitish aspect. Spike short, square, and searcely distinguishable from the stem below.

† Leaves 2-ranked.

11. L. apodum Linn.: stem branching and rooting near the base; leaves 2-rowed, roundish-ovate, membranaccous, acute, denticulate, flat; with superficial ones alternate, acuminate; spikes terminal, sessile, subsolitary.—and L. albidulum Muhl. Willd. Pursh.

HAB. Wet rocky places. N. Y. to Flor. July, Aug. 21.—A small erceping species, which can be recognized at once by its 2-ranked, thin and membranaeeous leaves.—Probably identical with the foreign L. helvetieum.

*** Capsules axillary.

12. L. lucidulum Nich: leaves in 8-rows, linear-lanceolate, denticulate, acute, spreading or reflexed; stem ascending, bifid; fruit axillary, not in a spike.

HAB. Low grounds. Can. to Car. July. 24.—Stem 8—12 inches long, nearly erect, simple or bifid, dark green. Leaves longer than in any of the preceding. Fruit axillary, sessile, about an inch from the top of the stem, semicircular.—The stem often bears bulbs instead of capsules.

13. L. sclago Linn.: stem erect, fastigiate, dichotomously branched; leaves scattered, linear-lanceolate, pungent, entire, imbricate,

rigid; fruit axillary-and L. recurvum Willd.

Hab. Highest summits of the White Hills, N. H. Big. Arctic Amer. 24.—Stem 3—8 inches high, rigid, with the branches of the same thickness from top to base. Leaves in about 8 rows, spreading, shining.

2. ISOETES. Linn.

Capsule membranaceous, not opening, immersed at the base of the frond, one-celled. Seeds angular, attached to numerous filiform receptacles.

I. lacustris Linn.: leaves subulate, flat, somewhat terete, fleshy, dilated and imbricate at base.

Hab. Bottoms of rivers, near Oswego Falls, N. Y. Pursh. Penn. Nutt. & Schw. 4.—Root broad and fistulous, with simple fibres. Fronds 2—5 inches long, dilated and imbricate at base, all radical, flat above, convex beneath. Fruit monoecious; sori cordate-oval, immersed in a corresponding cavity at the base of the frond.

ORDER CXLIII. MARSILEACEÆ. Brown. Lind.

Fructification radical. Involucre subspherical, not opening, coriaceous or membranaceous, 1 or many-celled.—Aquatics.

1. SALVINIA. Micheli.

Involucres 4—9, imbricate, connate, resembling an unilocular capsule. Sporx inserted upon a central receptacle.

10000

S. natans Willd.: leaves elliptic, subcordate, obtuse, with facicles of hairs above; fruit subsessile, aggregated.—Marsilca natans Linn.

HAB. Lakes and still waters. Can and western part of N. Y. Pursh. ©.—Leaves nearly an inch long, opposite, 2 ranked, fine green. Fruit globular, in radical clusters, under water.—Floating on water like a Lemna.

2. AZOLLA. Lamk.

Monoecious. Sterile ovate, of two cells separating transversely; the upper containing several angular stalked bodies. Fertile on the some plant; capsules numerous,

stalked, globose, of one cell and one valve, and in an ovate, close involucre. Seeds several, angular.

A. caroliniana Willd.: leaves two-ranked, imbricate, ovate-oblong, obtuse, spreading, red beneath.

HAB. Lakes, &c. N. S. and throughout the Southern and Western States. ©.—A small plant floating on water, and somewhat resembling a Jungermannia. Leaves all radical, 2—5 inches long, subulate, fleshy, semi-cylindrical.

ADDITIONS AND CORRECTIONS.

Page 18, 5th line from the top, for "radicals" read radical.

Page 93, 7th line from the top, for "Teprosia," read Tephrosia..

Page 96, 1st line, for "CERASSUS" read CERASUS.

Page 114, 16th line from the top, for "declinous" read diclinous.

Page 116, 2d line from the bottom, for "sessle, lianceolate" read sessile, lanccolate.

Page 125, 20th line from the top, after "many-seeded" add when mature.

Page 222, before VACCINEÆ, insert

12. LEIOPHYLLUM.

Calyx deeply 5-parted, persistent. Corol 5-petalled. Stamens longer than the corol; anthers lateral, opening on the inside longitudinally. Capsule roundish, 5-celled, 5-valved, opening at the top. Seeds small, smooth, not winged.

Decandria. Monogynia.

L. buxifolium Ell.—Ledum buxifolium Ait.—Ammyrsine buxifolium Pursh.

Hab. Pine barrens, N. J. and high mountains, S. Car. May, June. 5.—A small evergreen shrub 6—18 inches high, branching, smooth. Leaves small, oval-lanceolate, entire, smooth, coriaceous, with the margin revolute. Flowers numerous, white, in small terminal corymbs.

Sand Myrtle.

Page 277, 17th line from the bottom, for "radicle" read radical.

Page 308, 9th line from the top, after "Style simple," add Nut.

Page 310, 17th line from the top, for "commor" read common.

Page 326th, 22d line from the top, for "Behela" read Betula.

Page 337 and 339, for "conferea" read confere.

Page 390, 19th line from the top, for "Agrostris" read Agrostis.

Page 394, after the 6th line, insert

** Flowers in panicles.

Page 417, 12th line from the top, "Lymnetis" read Limnetis.

Page 420, 11th line from the bottom, for "Thurb." read Thunb.

Page 429, 22d i " from the bottom, for " Killingia" read Kyllingua.

INDEX

OF THE

ORDERS AND GENERA,

WITH ACCENTS.

IF The Names of the Orders are printed in small capitals—the Genera in roman—Synonyms in italic. The figures occurring after the letter s, also refer to the Synonyms of the Genus.
